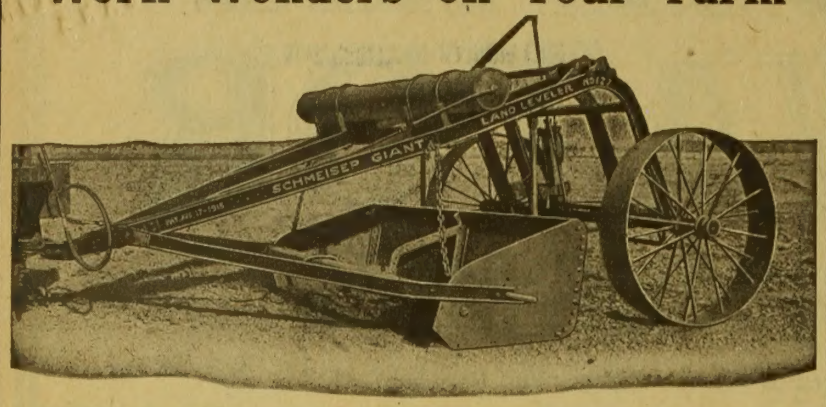
We manufacture levelers for all sizes of tractors

A Schmeiser Giant Leveler will Work Wonders on Your Farm



MOVING IMMENSE AMOUNTS OF DIRT DAILY, and working on ground too tough for horses and Fresnos to tackle, SCHMEISER POWER LAND LEVELERS are now being used with utmost success on the larger ranches of California, saving their owners time, labor and money.

Three Sizes—"Giant," "Junior," "Midget"

SCHMEISER "GIANT" LEVELER—Bucket 11 feet wide, 3 feet high, 4 feet sides; capacity of 3.5 cubic yards. With 2 men and tractor does the work of 9 men and 36 horses with Fresnos.
Price, f. o. b. Davis, Calif.....$900

SCHMEISER "JUNIOR" LEVELER—Bucket, 8 ft. wide, 3 ft. high, 3½ ft. sides; capacity 2.43 yards.
Price, f. o. b. Davis, Calif.....$650

"MIDGET"—Bucket, 8 ft. x 7½ x 2½ ft. Capacity 1.45 yards.
Price $350

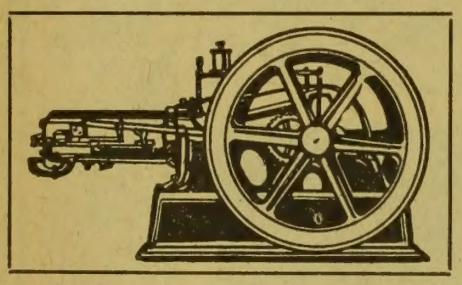
We Are In Business To Stay



That ought to help convince you that we are mighty particular about the construction of

COMMERCIAL ENGINES

We are building good pumping engines and a good reputation at the same time—so you see we can't afford to take chances by turning out engines that would in any way reflect discredit on the builders.

Long after the cheaply constructed engines have been consigned to the scrap heap

Commercial Engines

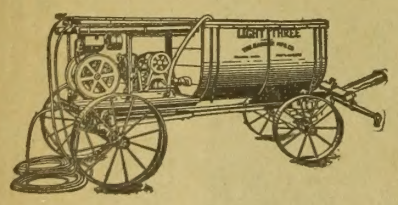
will be on the job—faithful, steady and efficient.

Commercial Engine Co.

2416-32 Porter Street, Los Angeles, Cal.
Branch: 1228 "H" Street, Fresno, Cal.

With "war prices" on most everything it is a pleasure to be able to quote a price on the

HARDIE LIGHT TRIPLEX



that any grower can afford to pay for the best made, medium capacity rig on earth. Catalog? We make several sizes.

The Hardie Mfg. Co. Portland, Ore.
Theo. Poindexter, State Agent, 338 Brannan St. San Francisco

STUART PRUNE

ORIGINATED BY J. F. STUART, RIPON, CAL.

Twenty-seven dried prunes to the pound.

This prune is a cross of the French prune and the Tragedy prune into the Silver prune—the Silver being the mother-prune.

The market price of this prune is 12½c per pound.

The University test is 53.5 per cent sugar. It drops from the trees and processes like the French; has a very delicious flavor; is black when dried; the wood is hard like the French; is a prolific bearer and dries down very heavy. Small pit.

We are exclusive owners. 5000 budded trees in stock for sale this season. Also plenty wood for grafting.

A large and fine stock of Almond, Pear, Peach, Apricot and Prune trees for sale. Write for prices.

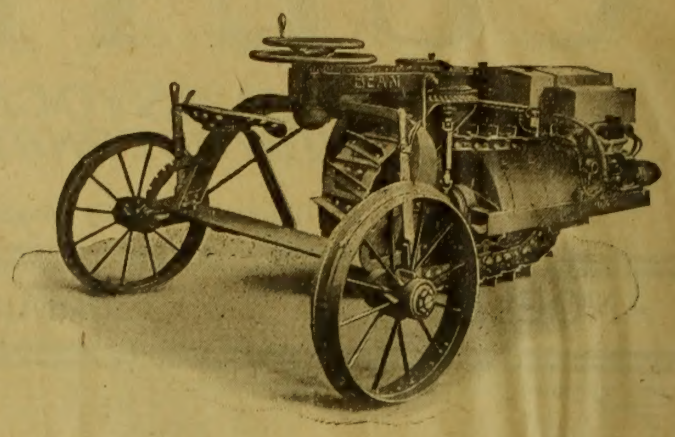
RIPON NURSERY AND IMPROVEMENT CO.

J. F. STUART, President. RIPON, CAL.

Why Use *Horses*

When This Great Little 2800 lb.
BEAN TrackPULL Tractor Makes It

Pay to Get Rid of Them



BEAN TrackPULL SIX HORSE Tractor

Watch For Our Demonstrations

Horses are great pets! BUT, you are running your orchards or your vineyards to MAKE MONEY and horses are MONEY EATERS—a fact that the wonderful patented BEAN TrackPULL 6-horse Tractor proves absolutely. Sooner or later every orchardist and vineyardist is going to find out that paying out $225.00 a year just to feed one team, and $675.00 a year to feed three teams whether they work or not IS TOO MUCH! When a simple little tractor that "eats" only when it works and that does the work of three teams costs to buy only a little more than it costs just to feed four teams for one year isn't it time to think of getting that tractor?

No Other Works Like This In Vineyards and Orchards

This Tractor works between five-foot rows in a vineyard and under tree boughs only four feet off the ground in an orchard; and it will plow within an inch of the vines without breaking off young shoots, and closer to your trees than any horse can go.

The BEAN TrackPULL Tractor pulls anything that six horses can pull. Especially adapted for cultivating. Enjoys working in the hot weather when your team sweats, loafs and pokes.

The BEAN TrackPULL is by far the simplest of all tractors. Its constructions (covered by basic patents) permits greater friction with lighter weight, and light weight means low operating cost and ease in handling. A boy can operate it. The BEAN doesn't pack even the loosest soil. You should see it work in soft ground!

Note that the BEAN pulls itself over the ground instead of pushing itself. It's the only light tractor that "gee's" and "haws" like a team. When you hit soft spots you simply swing the whole track to right or left and pull out.

Other features are: Turns clear around inside a ten-foot circle. Gets into corners like a team. Pulls as strong on turns as on straightaway. Motor is simple four-cylinder automobile type—but for heavy duty. Power goes through only four big gears and simple friction clutch. Hyatt Roller and New Departure Ball Bearings throughout fully dust protected. You can remove grousers and wheel flanges and run on boulevards. Works night and day when necessary. Has pulley for stationary work.

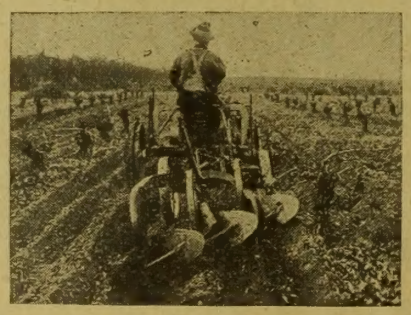
Send RESERVATION Coupon

Sending in coupon below doesn't obligate you to buy. It simply reserves one of these tractors for you. If you don't buy in a reasonable time after coupon is received by us the tractor is sold to some one else. That's all there is to it.

We'll send you big descriptive folder and tell you name of nearest dealer who can demonstrate tractor for you.

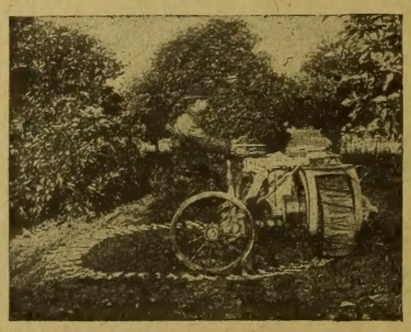
Don't wait. Thousands want this patented tractor and no other, and soon we will have sold our entire year's output. We are sold a long way ahead now.

The BEAN TrackPULL Tractor will save you big money. If you don't reserve one now you may have to wait another year.



IN THE VINEYARD

IN THE ORCHARD



TURNING IN TEN-FOOT CIRCLE

Bean Spray Pump Co.

Vol. XLVIII No. 1 LOS ANGELES: January 6, 1917 One Dollar Yearly

California State Dairy Cow Competition

New Year Expected to Bring New Entrants in the State Competition which Prof. Woll of the University of California is Conducting. Two Months Longer for Entering the Competition

WHILE California producers of beef have been electrified by the great showing which this state made at the recent International at Chicago, dairymen have likewise occasion to feel proud of the position this state is taking along dairy lines. Only a few years ago a world's record for milk production was held by a Yolo County cow. True, it was only a few days or weeks before the laurels were taken from her, but during the past year a Colusa County cow won the world's ten months' record, and she still holds it, but owing to unfortunate circumstances she failed in finishing the year at the wonderful stride she had set during the first ten months. The best of dairy experts say that Winnie Korndykè Cornucopia de Kol will yet produce 32,000 pounds of milk within the 12 months, and while she has failed in making the record anticipated, she has still shown that California is producing along dairy lines some wonderful stock.

California prefixes to nearly everything she undertakes "biggest and best in the world", so when the state university proposed a dairy cow competition open to every cow in the state, "biggest in the world" had to go. Purses in excess of $7400 were raised and the competition is now on. The contest began the first day of November and will continue through 1917 and the first two months of 1918. Entries may still be made. It has taken some time for dairymen to grasp the opportunity which is offered.

The $7400 in premiums will be a small factor of the reward secured. Even with grade herds these awards will add dollars to the selling value of the stock; with pure bred herds it will mean almost incalculable benefit.

Regarding the competition we may quote from circular 153 issued by the state university. "Open to all kinds of cows. The competition is not restricted to pure breds, but is open to all kinds of cows, including grades and cows of mixed breeding. Cows of the latter classes do not come into competition with pure breds in the awards of most prizes, since a considerable number of the prizes are awarded for records made by such cows only. The value of the cash prizes to be competed for by grades alone amounts to over $1000, and a large number of special prizes will be awarded for records made by grade or common cows, or by cows irrespective of their breeding. It is hoped that the provisions made for liberal prizes for this class of cows will appeal to many farmers owning common dairy herds and that they will enter cows in the competition in large numbers."

Details of the prizes offered were given in a former Cultivator, but every dairyman should write at once to Prof. F. W. Woll at the University Farm, Davis, and ask for Circular 153 or for entry blanks.

It may be recalled that amongst the prizes offered were three prizes of $100 each offered by the California Cultivator to owners of herds, members of cow testing associations. One purse of $100 cash for highest average production of butter fat for one year by herd of ten to 25 cows; purse of $100 for highest average production of butter fat for one year by herd of 26 to 50 cows; purse of $100 for highest average production of butter fat for one year by herd of over 50 cows.

Almost a World Beater

Winnie Korndyke Cornucopia de Kol, California record holder for one year and world record holder for 305 days' production. At that time she had to her credit 27,443.3 pounds milk and 827.3 pounds butter; seven days' butter 28.73 pounds, milk 789.1; 30 days' butter 117.7 pounds, milk 32,217.0 pounds; 100 days' 10,097.2 pounds milk. Owned by J. S. Gibson Company.

Every member of a cow testing association should take advantage of the opportunity to win one of these prizes. There is no entry fee nor expense connected with this contest. The university, which is conducting the contest, felt at first that certification of the performance of each animal should be made by a representative of the university, but now it has been deemed unnecessary to impose this condition, and from a circular which is being mailed to cow testing associations by the university we note; "the only requirements being that copies of the complete records of production of milk and butter fat by the individual cows by months be made out and transmitted to the university on completion of the testing year, at any rate prior to March 1, 1918, and that the correctness of the records be certified to by the president, secretary and tester of the association."

Dairymen, bear in mind that every herd, member of a cow testing association, is eligible to this class, whether the herd be made up of pure breds, grades or just scrubs.

Membership in a cow testing association has been recognized as a purely money making proposition. "Weed out the boarders" is the slogan, and the older associations have found wonderful profit in them, yet many dairymen refrain from conducting these tests. The Cultivator purses will encourage these organizations to make more thorough tests and to bring the averages of their herds up to the highest possible point.

Who has the best practical dairy in California? Let us find out through this state dairy cow competition.

Imperial Valley Live Stock Fair Makes Good

Written for California Cultivator by F. F. Stonerod

WHEN the officials of the county farm bureau first proposed a live stock show to be held at El Centro this year consisting of live stock and poultry exhibits only, and doing away with the usual horse races and other side attractions, the business men expressed misgivings that the show would not be a financial success. At first it was a difficult matter to raise money to hold the show, but through persistent effort on the part of Paul I. Dougherty, director of live stock, and A. M. Nelson, manager of the fair, the necessary money was raised or pledged.

The show was held in the center of town. Canvas was stretched between buildings; tents erected on several acres of vacant lots; and swine pens, horse stalls, cattle accommodations, etc., installed in such a practical and satisfactory manner that visitors marveled at the smoothness with which the large number of entries was handled.

As the show was held for the most part out in the open it was subject to irreparable damage from the elements, and the heavy rain two days before the fair opened almost wrecked the ambitions of the promoters. Considering the long chances the difficulty of raising money to finance the show, and various other drawbacks which would have discouraged the average, the management of the first real Imperial Valley Live Stock Show deserves commendation.

Professor E. W. Major of Los Angeles judged the dairy cattle classes. Professor Major has been a conspicuous figure in the 1916 show ring. Professor R. H. Williams of the Arizona University judged swine and sheep. Both judges placed the draft classes. Their work was highly satisfactory in every way.

The Holstein classes in the cattle, and the Duroc-Jersey classes in the swine divisions outnumbered the other breeds considerably. No less than eight two-year-old Holstein bulls lined up for the judge. The Timken Ranch Company had three entries in this class and captured first and third places. The first prize youngster then took the grand champion over all ages. He is a Morris bred bull, Goldstone Sir Alcartra Pietertje and is one of the classiest young bulls we have seen. The second prize bull in this class is a Hollywood, Washington, bred bull which was highly fitted but fell just a trifle short of first prize requirements. The Holstein cow class was replete with surprises to ring attendants. Both in quality and quantity they surpassed expectations. A. M. Draper of Holtville, a new breeder, brought out the grand champion cow in Nancy Mercedes DeKol, a nine-year-old matron of excellent type and conformation. Dr. W. O. Johnson brought out a fine string of young females. Allison Peck had the only aged bull in the show.

The Jersey class was a disappointment in that there were but two exhibitors on hand. F. H. Van Derpoel won practically everything in sight. In Fern's Silver Ray, who just finished making the second highest California state butterfat Jersey record, Mr. Van Derpoel had the sensation of the show. She attracted large crowds of visitors. Incidentally Fern's Silver Ray captured first and grand champion Jersey cow.

The swine classes took down the bulk of the show prize money, which was divided between Duroc-Jerseys, Berkshires and Poland-Chinas. The two latter breeds were in the minority. Timken Ranch Company showed a dandy lot of both Durocs and Berkshires. One of their Berkshire sows was a champion at San Francisco last year and looks as good today as she did one year ago. Model A. D., their mammoth Duroc boar, ran away with first and grand champion. This boar is good enough to get second prize at the 1916 National Swine Show. J. E. Peck had the champion sow in the Duroc class and also won the largest number of premiums in the show. W. R. Warne won everything in the Poland-China class.

Coming at a time when so many Imperial Valley farmers are going wild over cotton, this fair will serve its greatest economic good if it will impress the community with the fact that animal husbandry is the most stable and sure of all agricultural pursuits. The state that neglects its live stock industry or lays it aside for a crop that is more or less in the nature of a speculation, is playing with fire and will sooner or later get burnt.

Nitrogenous Fertilization

Number 6

When should Sulphate of Ammonia be applied?

SULPHATE OF AMMONIA

For ORANGE groves in regular bearing the ideal way is to divide the total amount, say 8½ to 10 pounds per tree, into several portions distributed over the growing season. One may be applied about six weeks before blossoming, one when the petals begin to fall, and subsequent ones in June and in September. If labor cannot be spared for this, the first and last periods will probably give the best result.

For LEMONS, as they are in continuous bearing, even more frequent applications are advised —say, six or even eight—after irrigation.

For GRAPEFRUIT, the special requirement is that they shall size up well, hence a large portion of the total amount may be applied when the fruit is half grown.

For TRUCK CROPS, broadcast Sulphate of Ammonia, 100 to 300 pounds per acre, before seeding or setting out the plants, or divide into two portions and apply one before planting, the other between the rows when the crop is well started.

For FIELD CROPS, apply broadcast by hand or machine at time of planting.

Spraying and Citrus

Written for California Cultivator

MILLIONS of dollars has been saved to California citrus orchards by the spray pump. Formerly sprays offered the only means of reaching either insect or fungus pests. Fumigation came, and it was felt on the part of some that a cure-all was found, and indeed it has proved for most insect pests of citrus trees a most effective means of control.

But there is the red spider and all the fungous troubles yet to be handled by the spray pump. Dust "sprays" have been used to some extent on red spider. The application by the dusting method is more economical, and under right atmospheric conditions often effective, but the liquid sprays are much more generally used. In early spring it is perfectly safe to assume that red spider will appear. Give a thorough application of lime sulphur—which may be home mixed, or a regular commercial mixture, or some of the sprays which are known to control this pest. Repeat this treatment occasionally through the summer if perfect immunity is desired.

Another insect handled satisfactorily with the spray pump is the mealy bug, though some have found double fumigation effective—that is, after one hour's exposure to the ordinary dosage the same dose is repeated. When spraying is followed the usual mixture is of carbolic emulsion, consisting of carbolic acid, five gallons; whale oil soap, 40 pounds; water, 40 gallons. This is a stock solution. For spraying trees dilute 1-20. Army worms, beetles, etc., are best handled with tree tanglefoot or similar sticky material or other mechanical methods, or with arsenical poisons. The treatment most generally used with fungous troubles of the citrus is Bordeaux mixture.

No Cyanide

But this year many other pests will necessarily be controlled by the use of the spray pump. Cyanide has been at a premium, and is in fact impossible to secure. We understand plans are making for a full supply for another year, but "because of the war, etc.," the available supply has been greatly reduced. How may these pests be temporarily handled? There are several commercial sprays, some of which are economical and effective. For those who may prefer to mix their own we have asked for information from Prof. H. J. Quayle, who gives us the following excellent advice:

Prof. H. J. Quayle

It is not easy to recommend with satisfaction any particular spray for black scale on citrus trees, for the reason that no one spray is so greatly superior to all others as to merit its unqualified recommendation or approval. Probably one that would be as satisfactory as any is a distillate-soap emulsion, using distillate of approximately 30 to 32 degrees Baume at the rate of five or six gallons to the 200-gallon spray tank, with the addition of five or six pounds of whale oil soap or six or eight pounds of soap powder to the same tank.

The black scale at this season of the year is considerably more resistant than soon after hatching in August or September. For this reason it is necessary to use a rather stronger spray.

There is no uniformity at the present time in regard to the distillates available for spraying. Our conclusions, after testing out various fractions of oils of different gravities, are that the oils containing the least of the so-called "smoky hydrocarbons" are the least injurious to plant foliage. These so-called smoky hydrocarbons form the part of the oil that is largely removed by the acid treatment. Therefore, acid-treated oils which have the injurious products removed, other things being equal, are preferable for spraying plants.

In some sections a lighter distillate is often available, this running around 34 gravity. The recommendation as to the strength of distillate given above is based upon a distillate of 30 to 32 gravity. If a distillate of higher gravity is used it should be used at a greater strength, and on the contrary, with a distillate of lower gravity the strength should be decreased somewhat.

If kerosene is used, which has a gravity of about 42 degrees, this may be used at a strength of 10 per cent or 20 gallons to the 200-gallon tank. The kerosene oils are the least injurious of all oils to citrus foliage, but at this season of the year, when the hot weather is passed, there should not be very much tendency to spotting the fruit by the use of the oils. Of course, oil sprays and soap sprays, too, for that matter, if the use is continued, will be detrimental to the general vigor of the tree.

The application is a very important phase of the spraying process. The one feature to be kept in mind is the fact that black scale is largely on the under side of the twigs or leaves and that the spraying should be applied from below. In the case of scale spraying it seems best not to use too fine a mist spray as would be desirable in the case of applying poison sprays or fungicides. It is necessary to hit the scale with more or less force, so that a nozzle throwing a fairly good volume of spray, and at the same time with not too great a pressure, seems most effective. It is not necessary to go above 200 pounds' pressure. In fact, 150 pounds is satisfactory with the proper nozzle.

MEALY BUGS CONVEYED BY TENTS

By Burr R. Jones Los Angeles County Horticultural Commission

Considerable anxiety has been felt this year by growers whose orchards were free from the mealy bug pest lest the insects be brought to them on the tents of fumigators coming from an orchard which is more or less infested, perhaps without the knowledge of the fumigator. No doubt special care should be exercised that this is not done. If there is any possibility that the tents would carry the bugs, they should be hung on a line and thoroughly washed with good hose pressure; or perhaps they can be spread upon the ground and washed in that position, both sides, of course, being treated alike. Some contrivance might be arranged for fumigating the tents with sulphur or a very strong dose of cyanide, but the preparation

PICKLING OLIVES

Written for California Cultivator
By J. W. Mills

OLIVES should be well colored before pickling but not so ripe as to be soft. They should be as near the same size as is practicable for a small olive cures in a shorter time than a large one.

When curing for home use, candy buckets lined with paraffine or asphaltum make good receptacles for small batches.

To Remove Bitterness

Dissolve concentrated lye in boiling water in the proportion of one pound to one gallon of water. Pour into a vessel one measure of the lye solution and six measures of water. This makes a solution in the proportion of one pound of lye to seven gallons of water. Cover the olives with this solution so that a slight pressure of a cloth will hold all the olives under. Stir the olives two or three times a day, working the top olives to the bottom. Withdraw the liquid at least once a day and pour it back. As the lye enters the olive it discolors the flesh, and by slicing the fruit the action of the lye is easily determined. Do not use the first lye longer than 58 hours as after that it ceases to act, and when the second lye is placed on the fruit examine carefully twice a day till the discoloration extends to or within one-sixteenth of an inch of the pit, when the lye should be drawn off and replaced with fresh water. If this can be changed three or four times a day the removal of the lye will be very rapid. By biting into and tasting a few olives it can be easily determined when all the lye is removed.

It will sometimes require more than two batches of lye to remove the bitterness. Mission olives picked after a moist spell of weather cure faster than those picked after a period of north wind.

Salting

After the lye is removed, place the olives in a solution of six ounces of salt to one gallon of water; after a day or two remove this and add a solution of the same strength, which is poured boiling hot over the olives which should first be dipped quickly in boiling brine; the olives should be placed in glass jars or tins which can be sealed. Seal immediately, just as you would in canning fruit, and the olives will keep indefinitely.

Should a dark even color be desired, leave the olives exposed to the air twice for 12 hours between changes of lye or rinsing water. Exposing them but once will leave light colored spots where they touch.

Messrs. McKay and Schuster of the department of agriculture, who have been studying the citrus situation, especially in regard to ripeness of oranges in Central California citrus sections, are now investigating as to refrigerator car service and to learn as to conditions within the car in transit and are installing self-registering thermometers. It is expected that some electrical heating system may be installed in cars which will be automatically controlled and prevent injury when blizzard weather is encountered.

NOT FOR RASTUS

FIG GROWERS' INSTITUTE

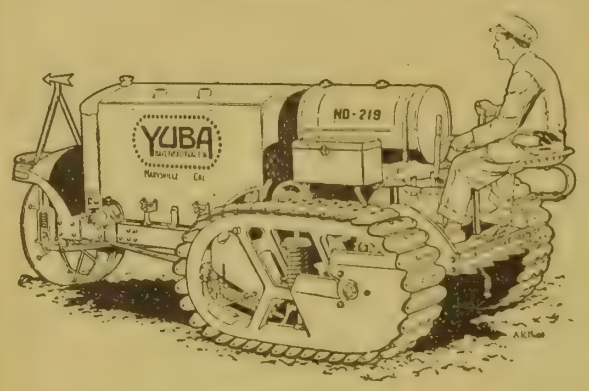
There will be a two days' institute of fig growers at Fresno January 12 and 13.

Several well known fig growers will address the gathering. Also, there will be a number of experts, including Prof. Condit, Roullard, Frisselle, Geo. Roeding, A. E. Beers, horticultural commissioner of Merced County; R. M. Roberts, Santa Fe agricultural expert, and Henry Markarian. Thomas F. Hunt, dean of the college of agriculture, will speak, and G. P. Rixford, plant physiologist of the United States department of agriculture, will talk on "The California Fig Industry." W. F. Toomey of Fresno will speak on the industry from the packers' standpoint. Other papers of practical importance to the grower will be read during the two days' gathering.

The following is the program:

Friday morning, 9:30-12, Sites and Soils for the Fig Orchard; the Fig Tree from the Nursery to the Orchard, W. T. Kirkman; Smyrnas vs. Adriatics, R. M. Roberts; Smyrna Type of Fig, Henry Markarian. Afternoon, 1:30-5, Automobile trip to orchards around Fresno with demonstrations. Evening, 7:45, Some Fundamentals of Agricultural Economics, Thomas F. Hunt; the California Fig Industry, Prof. I. J. Condit.

Saturday Morning, 9:30-12, the United States Department of Agriculture and the California Fig Industry, G. P. Rixford; Problems and Opportunities for the Fig Industry, Prof. J. E. Coit; Caprification and Varieties of Capri Figs, George C. Roeding; My Experiences and Methods in Drying and Packing Figs, H. Newby. Afternoon, 2-4:30, the Kadota Fig in the San Joaquin Valley, Sam Clark; Marketing Fresh Figs, Discussion; the Fig Industry from the Standpoint of a Packer, W. F. Toomey; Nematodes and Their Effects on Fig Trees, F. P. Roullard; Canning and Preserving Figs, Prof. Wm. Cruess.



Price Advance

January 15

1917

THE rising cost of material used in the construction of the Yuba Ball Tread Tractors has reached such a point that we are no longer able to maintain the prices heretofore charged.

It has been our hope that the increased output, the utilizing of improved mechanical devices in the manufacturing, the introduction of greater efficiency, the standardizing of factory practice, would enable us to continue supplying the tractors at the present prices.

But recent sharp increases in the price of steel necessitate an advance of 5% to 6% on each model.

All orders received before January 15, 1917, will be accepted at the present prices

The Yuba Construction Company
433 California Street, San Francisco
Factory at Marysville, California

Models 12-20 and 20-35

The Yuba Construction Company
433 California Street
Department **B205**
San Francisco, California

Gentlemen:—I have been thinking of buying a Tractor some time—possibly next year—but may decide to buy before the advance.

Please send me your Catalogue. I have.....acres. Yours truly,

.....

.....

FIGURES WON'T LIE

There is an old saying that while figures will not lie, liars will figure. There are times when we all find it wise to exaggerate in order to make a point more prominent. This we have done, at times, though only to a very slight degree, in referring to the magnitude of the citrus industry of California, making the statement that a carload of citrus fruit goes forward practically every ten minutes during the year. In our citrus article last week, "Practical Suggestions", we repeated this same statement but through the perverseness of the compositor the three letters t-e-n were left out, making it read "a carload every minute." Alexander Craig, an observing subscriber at Fair Oaks has figured out that a carload every minute means some 525,000 carloads a year, which of course is going some, even for California. This is a case somewhat similar to that of the man who by mistake had been published as dead, and who called upon the editor for an apology, to which the editor replied:

"Well, sir, you know this paper never takes anything back."

"That may be your policy, but, by heck, you will take this back," said the infuriated man. "I'm not dead, sir, and I won't stand for any blamed paper that's printed saying I am!"

"As I said before," calmly returned the editor, "this paper does not take back anything. If you insist, however, that you have been misrepresented, we will put you among the births in our next issue. That ought to square it."

Like the other publisher, we are not able to recall the misinformation which has gone out but through the "referendum" of Mr. Craig we are re minded to make this correction.

GLENN COUNTY FARM BUREAU MEETINGS

January 8 and 9, Codora, night meeting Tuesday, 9; 11-12, Larkin, night meeting, Friday, 12; 15-16, Orland, night meeting Tuesday, 16; 18-19, Jacinto, night meeting Friday, 19; 22-23, Germantown, night meeting Tuesday, 23; 25-26, Plaza, night meeting Friday, 26.

The monthly meeting of the directors will be held at the farm adviser's office in Willows on Saturday at 10 a. m., January 6.

A number of farm loan associations are being organized in various farm centers and members are urged to bring such organizations to completion early as practicable.

SOUTHERN VEGETABLE GARDEN FOR JANUARY

Written for California Cultivator
By D. F. Reichard

PRESUMING that the ground to be allotted for the vegetable garden has been prepared by thorough and deep tillage, as has been suggested under this heading since last October, we can be assured of a luxurious and productive garden during the approaching spring and summer.

The first thing to do for a successful garden is to make a list of the things you wish to grow, then draw a diagram or plan of the plot, allowing places for trees, if there are to be any, and along the fences or at the boundaries provide space for the perennials, such as asparagus, artichokes and rhubarb and berry plants.

When planning the garden keep in mind the local weather conditions, that the temperature is affected by the elevation and by slopes of the land. Low lands are always first to be frosted in the fall and last to get frosts in the spring, while the foothills, and especially slopes that face the south are the warmer sections, often being entirely frostless. The soil condition too must be taken into consideration when planning, and the irrigating possibilities also. If the soil is friable, located on a gentle south slope on the foothills with a good water supply the conditions are ideal for the year around garden.

The weather throughout the last six months has been so cool generally that the ground is colder than usual and we will find that all things put in the ground will start much slower than usual on account of the coolness, so it is well to plant only the hardier varieties during this month, except in

very favorable places where the soil has warmed up.

Using the flat system is much more satisfactory than either the ridge or raised bed methods of planting garden. The flat culture keeps the soil in better tilth and conserves the moisture better.

On light soils where the recent rains have drained off sufficiently to leave it in condition for working, plantings of Crosby Egyptian beet, early varieties of cabbage, carrots, semi-dwarf peas, White Six Weeks turnips, New York Special lettuce, onions, radishes and early potatoes may be made.

Horseradish, rhubarb, asparagus and such may be planted now on well drained soil. On the low land it is still too cold and wet to attempt planting.

Start seed beds, in protected places, of tomato, pepper, celery, eggplant, also start cabbage and cauliflower for later plantings.

Cultivate the whole garden after each rain storm to retain moisture. Prune all trees and berries not already pruned.

A GREAT CLINIC AND LECTURE

Written for California Cultivator
By C. L. Hughes

The eminent authority on cattle diseases, Professor W. L. Williams of Cornell University, held an interesting and instructive clinic on the ranch of Henderson Company, Sacramento, on December 26. At the invitation of J. M. Henderson Jr. a number of leading breeders and veterinarians were present, and at the close of the clinic everyone present united in declaring it one of the most instructive and interesting demonstrations they had been privileged to attend.

In the evening Prof. Williams gave an illustrated lecture at Travelers Hotel on the subject of contagious abortion in dairy cattle. A good sized crowd of breeders was on hand and listened to an excellent talk.

Professor Williams emphasized the fact that contagious abortion is not only a cause of great economic waste through lessened production in dairy cows, but that scientfic research has abundantly demonstrated the fact that the same contagious abortion is a prime factor in calf diseases, such as scours, pneumonia, etc.

The big idea back of Prof. Williams' advice to breeders and dairymen in reducing the destructive power of contagious abortion is cleanliness. This includes the proper care of yards and stables; the most painstaking sanitary precautions in the case of cows that show the slightest evidence of disease; and scrupulous care in washing the fresh cow and protecting the new-born calf against possible infection. That these measures will produce results that pay many times over for the trouble was well illustrated by some tables shown of the records in large herds that had been properly handled after becoming highly infected with contagious abortion.

Following the lecture Prof. Williams made replies to a large number of questions asked by breeders present, and the information contained in the replies was of a most helpful nature.

REORGANIZATION OF CALIFORNIA HOLSTEIN ASSOCIATION

An enthusiastic crowd of representative California Holstein breeders met at Travelers Hotel, Sacramento, on the evening of December 26 and effected a reorganization of the California Holstein-Friesian Association. Fred W. Kiesel, cashier of California National Bank, Sacramento, was elected president. Mr. Kiesel is building up a very large herd of highly bred registered Holsteins along lines that indicate unusually high ideals. Kenneth W. Abbott, Milpitas, was elected secretary-treasurer and is particularly well qualified to fill the position.

A number of important committees are yet to be appointed by the president, but each of these will have a well defined line of activity mapped out, and the rejuvenated association is going to work on broad lines, not only for the advancement of the black and white breed but for the good of the whole dairy industry in California.

Following the election of officers a number of important matters came up for discussion and the session lasted into the small hours.

Plant Apricot Trees

THE commercial planter—the man who plants in large quantities—knows that he must get a profit on his crop. The high prices paid for apricots this past season is but a mere indication of what is almost a certainty in the years to come—and that means profit in a large sense for every grower.

As California has practically a monopoly on Apricot Culture—due to climatic and soil advantages—there are enormous possibilities before the man who plants now.

Be Safe—Be Sure—Plant GOOD Trees

The best prices are always paid for the fancy fruits—and you know that it is folly to expect fancy fruit from inferior trees. Therefore plant the best.

Roeding's True Trees are the Best

Thousands of successful growers all over the West will testify to the exceptional quality of our stock. For a third of a century we have been supplying fruit and ornamental trees and vines—and our stock this year comprises a magnificent assortment not only of Apricots, but everything that the planter wants.

Let Us Advise With You

Tell us what you propose to set out this season—the nature of your soil, etc., and let us advise with you as to what is best suited to your locality. We are always glad to counsel with planters as to the outlook for not only this season, but the coming years, and what are going to be the probabilities of your receiving a profit when your trees come into bearing.

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertiser in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

THIS WEEK'S COVER

Those of us who have seen Yosemite only when the primroses are in bloom find little that is familiar in the photograph on the cover page, but now the Valley is open summer and winter, and excepting during heavy storms travel in and out is easy. It is indeed a great privilege to be able to visit that wonderland when the trees are bending under the weight of snow.

SEED FAIRS

Canadian agricultural interests and seed growers are uniting in carrying out a series of seed fairs where seeds, plants and even nursery trees are exhibited. It appeals to us that this is beginning at the right end of the production proposition and is a movement well worth encouraging in this country.

PEACHES PROFITABLE

Peach orchards in California have this year brought to the state more than double the amount of gold they did last year. In fact, last year's returns were $1,800,000, while this year's will be in excess of $3,000,000. There is a seeking after desirable trees. In extensive planting stand by the staples. This holds good in fruit production as well as in other farming operations.

SWINE BREEDERS

Southern California swine breeders are making preparations for a royal good time as well as an opportunity to talk shop at the annual meeting of the California Swine Breeders' Association to be held in Los Angeles January 18. In addition the Western Berkshire people are planning for their congress and sale, to be held in Davis in February. The Berkshire people are surely alive to the fact that it is going to prove a great meeting. The sale will be managed by Mr. Frost of the Swine World of Chicago. In preparations for the coming convention in Los Angeles the breeders are joined by the meat packers.

California proposes to become more self supporting in this matter of production of pork. We venture a guess that the million a month now going out of the state for meat products will be cut in half before many years.

RICE LEASES

Those who expect to lease lands for rice growing are being urged to incorporate in their leases a clause that gives the land owner the power to force the tenant to sell his share of the crop through an association. It is stated that the failure to perfect selling arrangements by the rice association this year was due to the fact that the Hindu, Japanese and Chinese tenants would not join. The result is a low price for the product.

We presume that a copy of a form of lease embodying the sale clause can be secured by writing to Ernest Behr, Willows, secretary of the Rice Growers' Association.

A number of the large land owners in the Sacramento Valley have agreed to insist upon a clause in their leases by which they may control the sale of the entire crop on their lands. Not only the landlord and tenant, but the entire industry, should be benefited by this arrangement.

LIMAS

There are over a half a million, or possibly 600,000 sacks of lima beans in coast warehouses. Practically all of these are in Ventura County. At present prices, $7.50 per hundred, which is the highest ever, this would mean an immense sum to be paid to California bean producers, but there is one fly in the ointment for many producers will not get these long returns. In fact, it is even feared that because some growers who had contracted with the cooperative marketing organization to dispose of their product have failed to keep their contracts, selling to outside buyers, that the association may be compelled to cover its shortage by purchasing at a higher price. Presumably the association will hold those who have violated their contracts for this loss, but many of them may be irresponsible. Every cooperative organization should make its contracts ironclad in order to protect those who are true to cooperation from those who are simply looking for momentary advantage.

BETTER QUARANTINE.

The fruit growers of the state are thoroughly alive to the need of a revision of the horticultural laws. Live stock interests do not appear to be so much in earnest as to their situation. In one particular, that of prevention of hog cholera, there has been lethargy in protecting the interests of the swine breeders. One county might have serious infections of hog cholera and yet shipments of hogs be permitted from that county to others. There is no quarantine against other states, and it appears that more power should be given to the state veterinarian or to some other body of the state in the control by quarantine where necessary.

If California is to become, as now appears, a great live stock state, there must be greater care in these particulars. Other states where the live stock industry is important are much more careful than is California.

GOOD READING.

Some of the best "copy" in this and every issue of the California Cultivator is to be found in the advertisements. Is there a new implement?—it is advertised. Has the nurseryman discovered a new and improved fruit?—it is advertised. Has the dairyman a cow which is beating all other cows in the world and making a record which shows her to be a money-maker for her owner?—it is advertised, for the owner knows that other dairymen will wish her kind. Does the grower of pork find a prize-winner which the best of judges have declared shows all the marks of turning a small amount of feed into a large amount of profitable pork?—it is advertised. Any agricultural accomplishment of worth is sure to appear in the advertising columns of the Cultivator, and be assured this class of reading matter is always of an optimistic nature, so as a mere suggestion this Christmas season, read from the first to the last advertisement in this issue of the Culitvator and see if you do not enjoy the reading. The up-to-date producer does this. He is impelled to by his desire for success, and success comes with the adoption of the most efficient methods.

Agricultural Notes

In citrus canker control in the Southern States the federal Department of Agriculture has in the past year employed 634 people.

Manchuria is expected to export 2,000,000 tons of beans of its 1916 output. The crop in some districts is 50 per cent larger than in 1915.

All orchardists of New Zealand are required to register all fruit trees so that they may be inspected by government officials for disease or insect pests.

Much study is being given in New Zealand to finding most profitable beef cattle to raise. The marketing of young beef is a large industry there and steadily increasing.

Exports of 1916 cotton from the United States up to December 9 have amounted to 2,715,265 bales. This is almost 1,000,000 bales in excess of amount exported in the same period last year.

A lot of Porto Rican and Jamaican oranges were last week destroyed in New York by the health department because they were "much too ripe for consumption." The loss to shippers is $50,000.

The export of frozen meat from South Africa is assuming large proportions. The total export of frozen meats amounted to 3,000 tons in 1915; this amount was equaled this year by one shipment.

Under a farm loan act, passed March, 1915, 464 farmers of British Columbia have received loans from the government amounting to over a million dollars. Long terms loans may run 20, 30 and 36½ years and on the amortization plan.

Depredations of predatory animals accompanied by outbreaks of rabies among them in parts of Oregon, California, Nevada, Idaho and Utah resulted in the shooting, trapping, and poisoning of over 11,000 coyotes during the last fiscal year by hunters in the employ of the biological survey of the United States department of agriculture. Altogether over 15,000 noxious animals, including wolves, coyotes, mountain lions and bobcats were destroyed.

Big Ben

A Westclox Alarm

FIVE A. M. for factory men who beat the time clock at the works.

Big Ben gives 'em their breakfast call long before the whistle toots. They used to pound the pillow right up to the last dot—until they learned a better way—as the paymaster soon found out.

Give Big Ben a trial, *yourself;* make *your* roll-over-time pay.

You'll like him face to face. He's seven inches tall, spunky, neighborly—downright good.

At your jeweler's, $2.50 in the United States, $3.50 in Canada. Sent postpaid on receipt of price if your jeweler doesn't stock him.

Agricultural News Notes of the Pacific Coast

Northern California

Market Director Weinstock has begun working on the stock marketing problem.

The California Swine Breeders' Association will hold its annual meeting at the University Farm at Davis in May.

Dr. Keane, state veterinarian for many years, has been reappointed by Governor Johnson for another four years.

Potato growers of Fruit Ridge are forming an association. They are giving special attention to producing certified seed potatoes.

Orland orange growers are considering the necessity of planting eucalyptus windbreaks along the windward side of their orchards.

The university farm will consign several Berkshires to the sale held during the meeting of the Western Berkshire Congress at Davis, February 15.

The Alameda Sugar Company will plant nearly 10,000 acres of sugar beets in District 70 of Sutter County. The beets will be shipped to Hamilton and Alvarado factories.

The prospect for a very heavy 1917 crop of both almonds and prunes in the Lodi district is good, as all the orchards are very heavily set with fruit buds at this time.

A letter from Paradise, Butte County, states that last week's frosts apparently did no injury to Paradise olives and that the olive harvest will go on without interruption.

The Citrus Association of Orland, Glenn County, has its grader installed and is packing oranges. Considerable fruit is reported to have been blown off the trees and made unfit for shipment.

The Loomis Fruit Growers' Association, at its annual meeting, elected as directors: J. Ferguson, B. Mehl, G. Brown, C. Mazal, N. Hansen, R. Nixon, R. T. Cook. Manager Nagel of the California Fruit Exchange addressed the meeting on the subject of marketing.

Central California

The Tri-state Poultry Breeders' Association had 900 entries.

Three dairymen of Hughson, Stanislaus County, were fined for maintaining unsanitary dairies.

It is rumored that the Santa Fe will build a branch across the mountains from Porterville to Johannesburg.

The annual state convention of the farmers' union opened December 18 at Hotel Hughson, Modesto. President C. S. Barrett of Georgia is one of the principal speakers.

The Tulare County exhibit at San Diego will be removed to Los Angeles, where part of it will be installed at Exposition Park and part of it at the chamber of commerce rooms.

Stanislaus County maintains her lead as the biggest butter producer in the state with 9,980,021 pounds of butter the past year. Imperial is her nearest competitor with 6,780,552.

The Acampo Fruit Growers' Association has this season shipped 52 carloads of grapes, which averaged $1308.84 per car. The shipments were considerably cut down by the frosts of the early part of May.

The Turlock Merchants and Growers' Association handled about 50 per cent of the cantaloupes, peaches, Egyptian corn and beans of the Turlock section. The balancing of the association books shows a most successful year.

A large dairy ranch is being developed on the old Gray Brothers ranch between Oakdale and Knight's Ferry, in Stanislaus County. Six hundred acres are being seeded to alfalfa and 500 head of pure-bred Holsteins will be installed.

Beans in Stanislaus County are 95 per cent harvested, only slightly damaged by fall rains. They made an average yield of 18 to 25 sacks per acre. One farmer reports at $120 yield of teparies to the acre. According to present outlook, there will be over a 50 per cent acreage increase in this crop in the county next year.

Southern California

Ventura orange growers used smudge pots last week during the cold weather.

Chula Vista, San Diego County, reports having so far escaped all damaging frosts.

The Covina Heights Groves Association expects to ship 150 carloads of oranges the coming season.

It is announced that the Italian Vineyard Company is planting a large part of its vineyards to English walnuts.

Ventura County supervisors are reconsidering their action in refusing to appropriate funds to continue the farm adviser work.

The Almond Growers' Association of Banning held its annual meeting on December 5. It has shipped out for the season 240 tons of almonds.

Over a half million bags of Lima beans are estimated to have been stored in local warehouses in bean districts of Southern California on December 1.

Imperial County, for the year ending September 30, produced 6,780,552 pounds of butter, a gain of nearly 450 pounds over the production of the previous year.

The recent annual meetings of the Covina Orange Growers' Association and the Covina Citrus Association show profits to the growers to have been the largest in 11 years.

The Covina Heights Groves Association is rebuilding the packing house destroyed by fire the last of October. It will be thoroughly up to date, equipped with the most improved machinery.

At the recent annual meeting of the Placentia Orange Growers' Association it was reported that 214 more carloads were sent out than during 1915. The estimate for the coming season is 1050 carloads.

More than 60 orange growers attended the orchard demonstration on Rancho Sespe recently when Manager Fleet took the growers all over the citrus orchards, explaining cultural methods.

The Coast

The Idaho Honey Producers' Association will hold its annual convention at Twin Falls, January 8-9.

Twelve of the largest dairies of Seattle have incorporated as "The Seattle Milk Dealers' Association."

Farmers of the district about Puyallup, Washington, recently held a farmers' public sale which was most successful.

The Colorado Farmers' Congress will be held during the week of January 15-20 at the agricultural college at Fort Collins.

There are 200 entries of laying pens in the egg laying contest being conducted at Pullman, Washington, by the state college.

Nine big wells are to be sunk on the 10,000-acre cotton plantation of the Goodyear Tire Company, near Chandler, Arizona.

The annual Farmers' week of the University of Idaho will be held at the college buildings at Moscow, Idaho, January 25-27.

The agricultural college of Colorado reports many cattle dying that are pastured on fields of corn stalks and given insufficient water.

A sugar factory will be built at North Yakima, Washington, during the coming summer. It will be equipped with a dryer for beet pulp.

Some complaint has been made from the Seattle market of frost-bitten potatoes received from California. The potatoes decay almost as soon as received.

There was a grain convention at Pullman, Washington, January 2-4, when grain growers, shippers and millers gathered to discuss bulk handling of grain, control of smut, use of tractors, etc.

Seattle egg dealers say that the Chinese eggs being received this winter are practically all white shelled, whereas formerly they were dark shelled. The Chinese have very quickly caught on to the American preference for white shells. Also, it is harder for the purchaser to detect their Chinese origin.

THE FRESNO NURSERY COMPANY

Harrow Buying Made Easy

HARROWS that do the best work and last longest cost so little that there is no economy in buying any but the best. A post card will bring you complete information about International Harvester disk, spring-tooth and peg-tooth harrows. Write the card now and mail it as soon as you can.

In the line there are bumper disks with rigid frames, four-wear bearings and gangs that are level at every cutting angle. Also disk harrows with independent gangs that can be used for side hill work and for filling dead furrows as well as on level fields. For wet, cloddy fields we have spring-tooth harrows with teeth that cannot work loose and that can be set to any desired cutting depth. Our smoothing harrows have square teeth that cannot twist, and stiffening bars that keep all the teeth at the same cutting angle regardless of extra strain put on any single tooth. Riding attachments and other special features can be furnished for all spring and peg-tooth harrows. We have also a complete line of one and two-horse cultivators.

This spring you will need tillage implements, harrows or cultivators. If you want the best your money will buy, write that post card today and mail it.

Unlock Stored Fertility

Is the fertilizer problem bothering you? Have you considered that there's plenty of plant food locked up in every acre of your soil? It's like money on deposit. Plan to draw on your account. Liberate that plant food by thoroughly pulverizing the soil with a

Cutaway (CLARK) Disk Harrow

It cuts, fines and levels the soil. The Double Action Harrow has a rigid main frame so rear disks can not slue. Close hitch and perfect balance make the draft light. No tongue truck needed. Bearings of hard-wood soaked in oil. Forged edge disks. There's a CUTAWAY for every purpose and a size for every farmer. The best dealers handle the CUTAWAY (CLARK). If you cannot get the genuine write us direct. Our book, "The Soil and Its Tillage," will show you how to unlock the plant food in your soil Send a postal for it today—the book is free.

STANDARD OIL COMPANY
(CALIFORNIA)

Silos in Stanislaus County

Written for California Cultivator By C. M. Conner

STANISLAUS County will produce nearly 10,000,000 pounds of butter this year, which places her in the foremost ranks as a dairy county. The silo being an important factor in economical feeding of dairy cows, a campaign was started through the farm bureau centers to encourage the construction and use of silos. At the close of the season of 1915, 130 silos were in use in the county. At the close of the present season we have 306. These vary in size from 40 to 150 tons, but the average tonnage is about 83. The average cost of filling a silo in this county, counting the cost of cutting, hauling and running through the cutter, is about $1.07 per ton. Eighty per cent of the farmers last year filled their silos with Indian corn.

Silos in Stanislaus County

Below the cheaper type of resaw, not so enduring as the type in upper illustration.

The silo provides a means of preserving food for cattle in such a state that it remains palatable and easily digested. It does not increase the amount of digestible matter in corn or barley or whatever the silos are filled with, but preserves it in a state similar to the green forage. The materials are preserved by their own heat and the formation of acids. When the silage has once reached the proper stage of fermentation it will keep for a long time provided air does not get in. Henry reports that instances are on record where silage 12 and 14 years old has been found in good condition.

There are many forms of silos and many kinds of materials used in their construction, but the main essentials are that the walls be air tight and perpendicular and of such strength that they will not be pushed out of line by the weight of the silage.

The dairymen in this county are beginning to appreciate the value of the silo in keeping the production of the farm up to the top notch and in keeping their animals in better health. This is particularly true in the irrigated sections where alfalfa only lasts about six or seven years. When the alfalfa is plowed up it takes about two years' cropping to get the land in shape to reseed to alfalfa. If no silo is available the crops grown on this land must be grain or hay crops. If these are sold as grain this of necessity reduces the number of animals that may be kept on the farm during the time the land is being put in shape for reseeding to alfalfa. If the dairyman has a silo he should adopt a sort of rotation, that is, he should plan to plow up about one-sixth or one-seventh of his alfalfa each year. He should also aim to get the most out of his stable manure by putting it on the land that is to be plowed, in order that it may be incorporated into the soil where the plant can make full use of it. The old alfalfa land may be plowed in the fall and sown to barley or oats. If this can be done early enough, say by the first of November, vetch may be sown with the grain crop. This crop may be cut with a binder and put into the silo. Do not cut too green, let the straw get a little color. Plow the land well, water after plowing, cultivate thoroughly and plant to Indian corn. If the land is of average fertility and the water supply is right this practice should give more feed per acre than would have been obtained from the alfalfa. Some of the dairymen in this section are getting ten tons of silage from the grain crop and 15 to 18 tons from the corn crops.

On the drier lands sorghum may be grown during the summer as it makes good silage and will grow with less water than field corn. It should not be put into the silo until the seed is ripe. With the double cropping system it sometimes happens that the frost catches the corn, but little or no losses have occurred on this account as the frosted corn makes very good silage provided it does not stand too long after being frosted.

When the corn has dried out considerably on account of the hot winds or from any other cause, water should be used to restore the material to the normal condition. If there are no dry leaves or dry stems no water need be used. Some have poor success putting first cutting of alfalfa into the silo. Most of the failures may be attributed to the use of too much water, which causes the formation of too much acid and may also cause the silage to become soft. Alfalfa is one of the few plants that is better cured as hay than made into silage whenever the weather conditions will permit.

Working the Auto

The silo cutter on the ranch of Mr. Barton at Escalon being operated by power furnished by the auto. The lower picture shows method of transmitting the power.

When the dairyman feeds his cows on alfalfa hay exclusively he is feeding an unbalanced ration; for example, a thousand-pound cow giving one pound of butter fat per day will eat about 30 pounds of alfalfa per day; this will contain 3.2 pounds of digestible protein and 12.8 pounds of carbohydrates. The cow actually required

2.5 pounds of protein and 14.1 pounds of digestible carbohydrates. By feeding 20 pounds of alfalfa and 30 pounds of corn silage you get a more nearly balanced ration. Not only do you gain in this way but you induce the animal to eat more by providing a change of diet. Very few dairymen feed grain and then only to heavy producers.

Only a few of the farmers have their own engines and cutters. Most of the filling is done by contract. The corn binder is coming into use for cutting the corn in the field and binding into bundles, which makes it easy to handle. I has also been found profitable to cut oats and barley with a binder as it can be fed through the cutter much more economically than if cut with a mower. One dairyman has rigged up an attachment to his auto and used it to fill a 150-ton silo. He extended the crank shaft far enough in front to clear the wheels, and by providing another bearing and braces he was enabled to use all the power of his engine. Rigged in this way he ran a 12-inch cutter and blew the silage over a 30-foot silo.

Vegetable Planting in North California

Written for California Cultivator By A. R. Gould

THE timely rains have been of greatest assistance, putting much of the land in shape for plowing or digging later on. This is a busy month for extended sowings of many subjects started in December, and we also endeavor to get as much available ground in shape for cropping.

Peas

Make successional sowings of those mentioned last month, also sow the following: Telephone, Stratagem, Senator, Alderman and Horsford's Market Garden.

If you have an orchard and wish to have plenty of peas to pick later on, providing this has recently been plowed and put in shape as it should have been ere this, you would serve a double purpose by sowing a few long rows through the orchard three or four feet apart. It will take two pounds of seed for a 100-foot row. Such a leguminous crop will leave the soil much better than before and will come in useful as a food crop. Since the more recent rains the orchard may be in some situations too wet for this but watch for the opportunity which may come later.

Onions and Leeks

The following varieties of onions may be sown this month; Ailsa Craig and Prize Taker, both large fine flavored onions and good keepers, Australian Brown, a fairly early type, Brown Globe (Morse selection), a very fine market onion, and Southport Yellow Globe, good cropper. Remember that half an ounce of seed will sow 100-foot row.

Leeks are not nearly so popular as they might be, and used in soups or served up in other styles they are a first class vegetable. Seeds of these should be sown now in boxes or in a small seedbed in the garden. Sow the seed in rows or broadcast, and when the seedlings are six to eight inches high transplant or thin out to four inches apart. Trenches 18 inches deep should now be prepared for the leeks and manure well mixed in with the soil at the bottom of the trench which can then be filled up to within ten inches for planting. The best varieties are Dobbie's Champion and American Flag. For cultural hints on producing fine well blanched leeks follow these monthly notes.

Carrots

A sowing of the French forcing variety and Danvers Half-long may now be made. See that your soil is fairly rich and not too heavy. One ounce of seed will sow a row 100 feet long. Do not sow your seed too thick.

Cabbage, Broccoli and Kale

Seeds of all these may now be sown on a well prepared seedbed and in a few weeks sturdy plants will soon be ready to plant out. Sow the following varieties for cabbage; Early Jersey, Wakefield and Early Winningstadt; Broccoli, Early Large White; kale, Dwarf Curled Scotch, Tall Green Curled and Jersey. Plant plenty of the later variety for chicken feed.

Turnips

Sow now for early use on well manured soil the following varieties: Early Snowball, one of the very best and not too large; Early White Milan and Early White Flat Dutch. Sow half ounce to 100-foot row.

Lettuce

Make further sowing of Big Boston, Early Curled Simpson and White Paris Cos.

Herbs

Secure plants of the following and plant in a corner reserved for them: Mint, thyme, sage, sweet marjoram and chives, all useful flavoring agents.

Parsley

Make a sowing of this and if sown around the borders of your garden it will also help to beautify. Best varieties are; Champion Moss Curled and Double Curled. Sow quarter of an ounce to 100 feet.

Ornamental Planting in No. California

Written for California Cultivator By Albert R. Gould

Roses—New Varieties

The rose beds should have ere this been dug, manured and the roses pruned and any vacant places should now be filled or new roses added to the collection. If the above work has not yet been attended to through pressure of work in other sections of the garden, get on with it as soon as possible, and if you have any very old roses of bush habit and you have not been getting good blooms from them or maybe they are developing rose rust, then grub them out and burn them. The ashes of these are more valuable as manure than the roses.

Now we will assume that the reader has a fairly good collection of the older varieties such as La France, Maman Cochet, Paul Neyron, Alfred Colomb, Capt. Hayward, Ulrich Brunner, Mrs. J. Laing, Magna Charta, Gen. Jacqueminot, K. Augusta Victoria, Baroness Rothschild, Gruss an Teplitz, Frau K. Druschki and Caroline Testout, all good roses, and that the desire now is to secure some of the latest and above all those that are unique in color and beautiful in form.

Keep your roses in a vigorous, healthy condition and spray early in spring with lime-sulphur, discard old bushes and prune when necessary and you will have prize blooms. Do not think, however, that you could prevent your roses from being attacked altogether by mildew. If you could control the sudden changes in the climate you could also control mildew, but we have no such power and we can only fortify our plants against these things. Such is our practical experience.

In the extreme northern part of the state and those other sections where the frosts are severe it is advisable to cover the ground around the roots with manure having plenty of straw in it and straw or some hay may be used to cover among the branches as a light protection.

Flowering Trees and Shrubs

Plant these now or secure for planting next month a few of the best for early flowering; Cercis Canadensis, "Judas Tree", Cornus Florida, large white flowers; Cerasus Japonica rosea pendula, weeping cherry; Cerasus, James H. Veitch, large double pink flowering cherry; Andromeda Japonica, drooping white blossoms; azaleas and rhododendrons in variety. We hope to deal with a larger selection of hardy shrubs, also conifers next month.

Continued on Page 19

Bigger Crops by Blasting

"The O'Connor prune orchard in the Santa Clara Valley was blasted in 1913," says the California Cultivator. "Its largest crop in six years was 3,900 pounds. After blasting the crop was 8,000 pounds—more than double—in a dry year. The prunes from the blasted orchard were much larger and the trees made a better growth." By using

GIANT FARM POWDERS
STUMPING — AGRICULTURAL

in *your* orchard you can increase your crop, add to the water-storage capacity of the soil, and enable the roots to feed on fresh plant food in the subsoil.

Hundreds of fruit growers in all Pacific Coast States plant their trees in beds made with Giant Farm Powders. They have found that trees in blasted ground grow faster, bear earlier and yield better than those planted the old way. They use the Giant Farm Powders because these powders loosen and powder the soil instead of packing it. Ask your dealer for either of the Giant Farm Powders—Eureka Stumping Powder or Giant Stumping Powder.

Free Book on Fruit Growing

Every fruit grower will find valuable information in the Giant book, "Better Orchard Tillage," written to suit Pacific Coast conditions. It tells and shows how to plant trees and subsoil orchards in the most effective way. This handsome illustrated book—or others—free. *Mail the coupon.*

Announcing A New Sand

$1095.00 F.O.B. SANDUSKY.

THE principal aim in developing this 10-20 tractor has been to widen the field of usefulness for Sandusky service. It solves the power problems confronting the farmer who does not require our large machine.

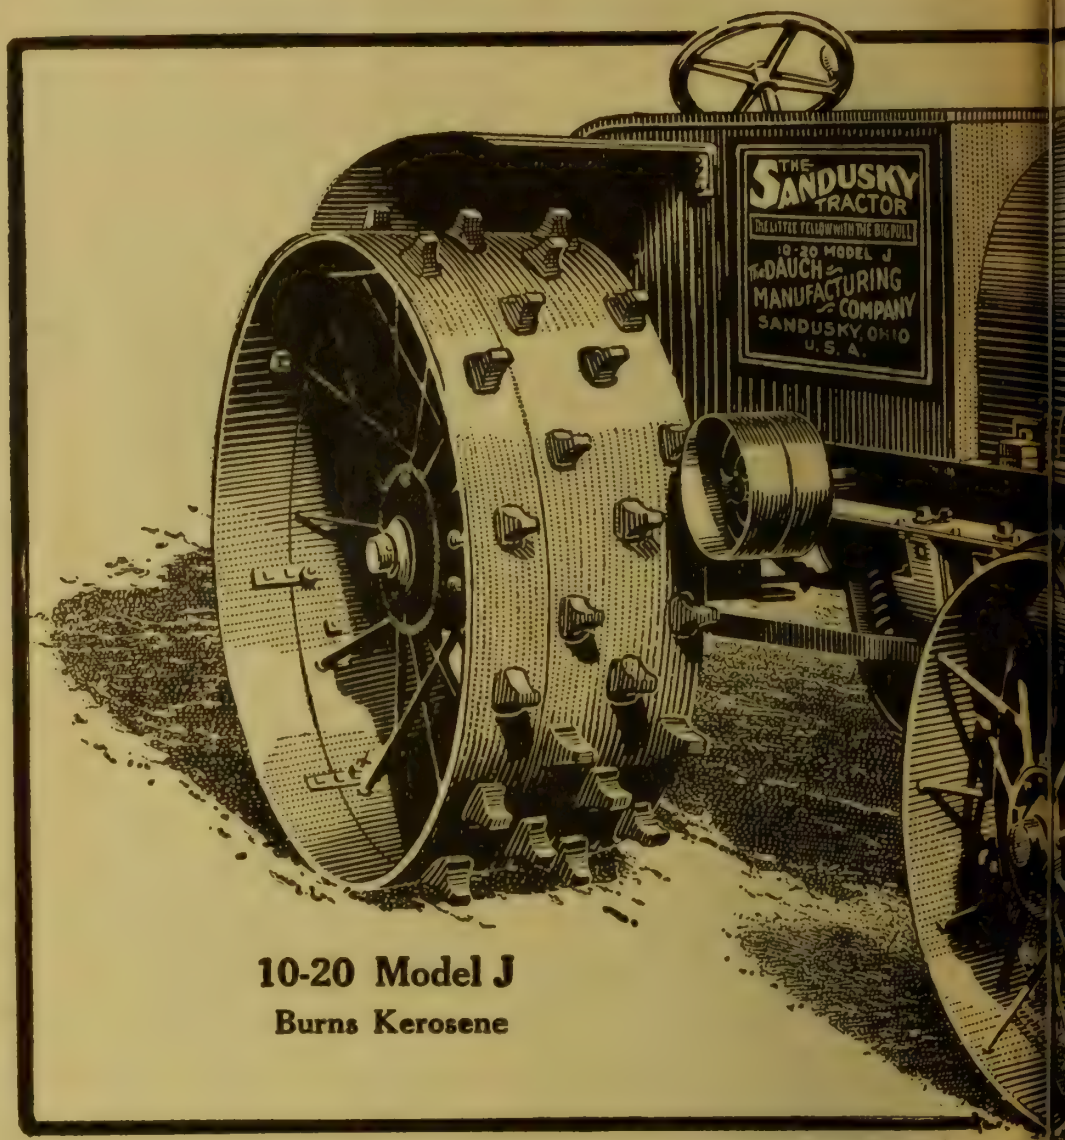
At our first conference, three years ago, covering such plans the argument was advanced: "Why not build a small *cheap* tractor which will sell itself on account of its low price?"

Our *manufacturing facilities* would enable us to do this on a large scale, But this did not accord with the *policies of our President,* Mr. J. J. Dauch, who personally controls seventeen large manufacturing establishments throughout the United States and Canada, each operated on the basis of "quality always."

This point having been determined, our first small tractor was designed and built. Farmers who saw this model wanted it; so it was with the second. From every indication these machines were far ahead of what was then being marketed. But they did not measure up to our ideal—a small tractor that we could afford to back with a binding guarantee; one that we knew would maintain the reputation thoroughly established by our larger machine.

The result is a tractor embodying our utmost efforts—not toward reaching a low price machine, but one to fill the need for a good tractor capable of real service at as low a figure as modern manufacturing facilities can produce and an efficient organization can market.

Engineers of world renown have approved its design, incorporating the famous Timken worm and gear drive, as representing the ultimate standardized small tractor. Years will prove that this Company has again set the pace of leadership in the Model J, as has been true in the case of our Model E.



10-20 Model J
Burns Kerosene

OUR GUARANTEE

We guarantee this machine capable of delivering a constant 2,000-pound drawbar pull. This is more than equivalent to handling two 14-inch plows at least eight inches deep in soil where a two-horse team can handle one 12-inch plow six inches deep, with a big reserve, or three 14-inch plows at depth formerly plowed with team and 12-inch bottom. We also guarantee it to deliver 20 horse power on the pulley, which furnishes ample power for the operation of belt machinery up to a 24-inch separator with full equipment—all on *kerosene* as fuel.

We further guarantee this machine free from defects in either workmanship or material for one year from date of acceptance and will furnish f. o. b. factory any such parts returned, transportation charges prepaid, for inspection and credit.

A NEW PLAN—

We announce an tractor selling. A coup of service, goes with e expert advice and help want it. See catalog fo

BRIEF SPECIFICATIONS

Our own specially developed four-cylinder, four-cycle, 4¼" bore, 5¼" stroke, quality motor. Drop forged high carbon steel crank-shaft, cam-shaft and connecting rods. Ninety-three percent tin base die cast interchangeable bearings. Valves enclosed. Combination force feed and splash oiling system. High tension magneto—impulse starter. Bennett air cleaner. A guaranteed kerosene burner. Surplus cooling capacity. Pulley for belt work. Adjustable cone clutch. Three speeds—2 and 3 m. p. h. forward and reverse. Timken David-Brown worm and gear drive. Hyatt equipped from motor to differential driving shaft, with universal couplings between motor, transmission and differential. This, together with *three-point* spring suspension, relieves road shocks, weaves and strains. All enclosed and protected against dust. Full steel construction. Short turning brakes. Weight, 4000 pounds. Length, 120 inches; wheel base, 76 inches; height, 52 inches. Rear wheel diameter, 48 inches; face, 12 inches and 6 inch extension rims; front wheels, 32 inches diameter, 6 inches face.

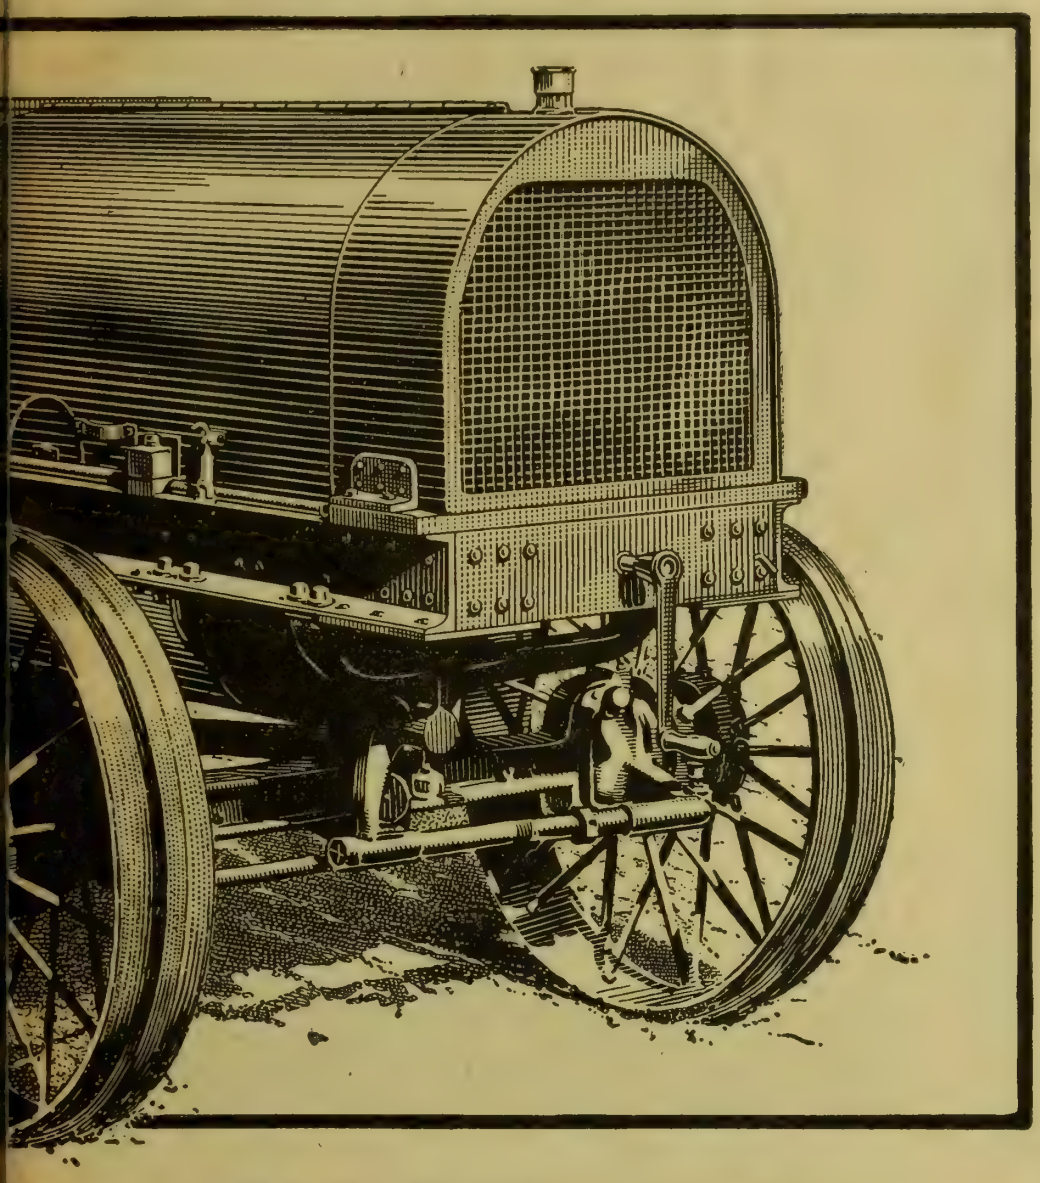
THE DAUCH MANUFACTUR

usky Tractor—"Model J"



$1095.00 F.O.B. SANDUSKY.

TO his engineers Mr. Dauch said: "We are not interested in the manufacture of a *cheap* tractor. Our manufacturing and sales organizations are imbued with the *quality* idea embodied in our Model E. We cannot afford to demoralize these influences by putting out an inferior product merely to meet price competition."

These thoughts, together with the fundamental principle that this tractor must be adapted to the widest possible range of usefulness, dominated the development work in all its stages.

As a consequence the service which this tractor will render, the results it will produce in dollars and cents, the economies of labor which it will effect on your farm, make its purchase a profitable investment. The brief specifications below, and the more detailed description in our booklet, prove to any man that this machine offers a greater value per dollar than elsewhere obtainable.

Compare the Model J power plant with others. Consider its light weight—only 4,000 pounds; its Timken worm and gear drive, which actually increases in efficiency with use; its Hyatt Roller Bearing equipment. Remember that bevel gears and ordinary bearings mean friction, wear and loss of power. Remember our guarantees are based on the use of kerosene as fuel. Think! The result will draw your good judgment to this tractor like a magnet.

The Model J is a truly general purpose tractor, adapted not only to plowing, but also to the preparation of the seed bed, and all other farm power work, thus enabling you to profit by its service throughout the year.

It will be physically impossible to meet the tremendous demand of those who wait until their field work is in progress. We therefore urge you to write us at once, fully outlining your requirements. This will not obligate you in any way.

TRY IT BEFORE YOU BUY

Continuing the policy created by us in the sale of our 15-35 Model E Sandusky Tractor, we will put the 10-20 Model J on your farm, demonstrating its ability to fulfill our guarantees under your own local conditions, and personally instruct you in the handling and care of this machine. It must prove itself profitably adapted to *your* requirements before you buy.

EE SERVICE

ely new departure in ok good for 100 hours Model J. This means out charge when you ails.

BOOK J-11 -FREE

It describes in detail the principles of design, construction and ability of this smaller "Little Fellow With the Big Pull." DEALERS OPPORTUNITY

The 10-20 Model J Sandusky Tractor offers an exceptional opportunity to high grade dealers who will stock this machine on protected territory contracts. We want men of quality to represent us—men who are abreast of the times, in position to give service to our customers, and willing to give the time and energy required to build up a real business. For such men we have an attractive proposition.

Look for this announcement in the principal farm papers. It will be followed by the greatest big-space advertising campaign ever put back of a tractor. This in itself will create a big demand for you. Send for our dealers' prospectus. It outlines in detail the policies underlying this establishment; also our complete plans for such co-operation as will rapidly develop this account into a good-paying, permanent business for you with ever-increasing opportunities.

Write today—better still, wire territory reservation.

Get Rid of Worms!

Many animals, especially hogs, are troubled with worms. When your hogs are unthrifty, you hear a little cough now and then, suspect worms.

Dr. Hess Stock Tonic

Keeps Hogs Healthy **Expels Worms**

So sure am I that Dr. Hess Stock Tonic will keep your hogs healthy and expel the worms, that I have authorized my dealer in your town to supply you with enough Tonic for your hogs and, if it does not do all I claim, just return the empty packages and get your money back.

My Stock Tonic is not a feed, but a true conditioner and tonic, highly concentrated, which contains blood purifiers, laxatives and drugs which are powerful worm expellers. Feed in small quantities, watch your hogs improve.

NEVER PEDDLED. SOLD ONLY BY DEALERS.
28,000 reliable dealers in U. S. handle it. Why pay the peddler twice my price?

25-lb. Pail, $2.25; 100-lb. Sack, $7.00

Smaller packages as low as 65c. Valuable stock book mailed free, if you write for it.

DR. HESS & CLARK, Ashland, Ohio

Dr. Hess Poultry Pan-a-ce-a conditions fowls, makes hens lay and is a great help at moulting time. Valuable for chicks, for pullets starting to lay and for all grown fowls. Costs a penny for 30 fowls per day. 1½ lbs., 25c; 3 lbs., 50c; 7 lbs., $1.00; 25-lb. pail, $3.00. *Guaranteed.*

Dr. Hess Instant Louse Killer A reliable lice killer, very quick acting. For use on poultry and stock. Use by dusting and sprinkling. Destroys bugs on cucumber vines, cabbage worms, slugs on roses. In handy sifting-top cans, 1 lb., 25c; 3 lbs., 60c. *Guaranteed.*

Write Dr. Hess about any sick animal or live stock trouble, enclosing 2c stamp. He will advise you free.

Live Stock Prospects

Written for California Cultivator By W. S. Guilford

IT seems to me that there are very bright prospects for the pure-bred live stock industry in California.

We certainly have the greatest feed and climatic conditions on earth for this business, and all classes of people are rapidly coming to a full realization of the great need for more and better live stock.

There is great activity in many of the breeds, and the time when the East will come to the West for breeding stock is nearing a reality.

The winning of the University of California steers and wethers was worth thousands of dollars to the live stock industry of the state, and it should be followed up another year by a big show of fat stock and breeding animals at the International.

California Shorthorn Breeders' Association

The California Shorthorn Cattle Breeders' Association was organized December 11, 1916, at San Francisco. The following officers were elected: A. W. Foster, San Francisco, president; A. N. Hawkins, Hollister, vice president; Daniel Stollery, San Francisco, secretary-treasurer. Among the charter members are Geo. Murphy, H. L. Murphy, E. H. Murphy, Thos. Gibson Estate, Wm. Bond, T. S. Glide, A. W. Foster, A. N. Hawkins, Paicines Ranch, and others.

The annual dues will be five dollars and the annual meetings held in San Francisco the second Monday in December. Publishers and editors of farm papers will be associate members of the association.

The advisability of a big live stock show for San Francisco in 1917 was discussed at some length, and it was the concensus of opinion that it is essential to the industry that such a show be held. It was also considered advisable to hold a consignment sale of Shorthorns in the near future.

There is a big field for Shorthorns in California and there is need for many more good herds.

Pedigree Stock Guarantees

I spent a day in Sacramento recently with Chas. L. Hughes, who is the live stock representative of the Cultivator and manager of the big pedigree stock sales organization organized this year at Sacramento. And as we discussed California live stock conditions in general and the affairs of this sales organization in particular, I wondered if every Cultivator reader fully realizes what this may mean to the pure bred live stock industry of California.

In the first place those who founded the organization; Fred Kiesel, Jim Henderson, the Morrises and the others, are as big men as there are connected with the live stock industry in America today. All of these have not only a full realization of the needs of the state in the way of pure bred stock, but they know the responsibilities of the breeder and seller of pedigreed animals.

They know that an animal must be right in every way, that it must be the one the pedigree calls for, that it must be absolutely healthy insofar as it is possible for the state veterinarian to determine, and that the records must be correct. No animal will be accepted for sale that cannot comply with these requirements no matter who the breeder or the owner may be.

I was very glad to learn that the plans of the organization contemplate the conducting of sales of all classes of pure bred animals, cattle of all breeds and horses, sheep and swine. There is need for this work, and it will soon be one of the big factors in California agriculture.

Tramp Dogs

There are a lot of ownerless tramp dogs in almost every rural community and particularly around small towns. They are half wild brutes, and necessity makes them very smart in rustling food. And when they get started to killing sheep they are very effective agents of destruction.

I know a sheepman who makes a business of locating all such curs and killing them. By so doing he is doing a great service for himself and for his neighbors.

There are plenty of other dogs, owned by townspeople and farmers, that are of no use and that because of their idleness frequently become sheep killers. But these worthless dogs are often highly prized as pets. Owners should be required to look after such animals carefully.

Well Groomed Dairy Cows

Cleanliness is essential in the dairy.. Where one keeps pure breds in which he takes pride cleanliness and best of care comes as a matter of course.

Feeding Rice and Rice Straw

There is a good deal of inquiry about the feeding of rice and rice straw, and there are reports in circulation to the effect that these feeds are dangerous. It is stated that both cattle and sheep fed rice and rice straw have died as a result.

Bad results have occurred when cattle have been fed nothing but rice straw for a considerable period. They simply become "plugged up" with this dry, woody substance, causing constipation and sometimes death.

Then sheep have been lost by turning a hungry band on rice stubble on which there was a large quantity of heads and kernels of rice. Animals not used to grain are often lost when put on full feed too quickly, and this is what happens in the rice field. It also happens when sheep are given all the corn they can eat at the beginning of a feeding period, and it happens when sheep are turned on rice, barley or wheat stubble.

But thousands of tons of rice straw and thousands of sacks of paddy rice are being fed now in the Sacramento Valley. Paddy rice is the threshed grain before the outer husk or shell has been removed by milling.

Horses, mules, cattle and sheep eat the straw quite readily, and there seems to be no reason why it cannot be used as a part of the ration of work stock and cattle the same as any other kind of straw.

And in this capacity it is helping out a great many farmers who are short of rough feed. Hay is scarce and high in price.

Farmers who have to buy grain are feeding rice to hogs, turkeys and chickens because it can be bought for less than barley or corn.

Hindus and Japs who raised large

"Gee!
But I Have an Appetite!"
A cow that eats poorly usually milks poorly, and any poor milker is a loss. Lost Appetite is only one of the common cow ailments that quickly disappear after judicious use of Kow-Kure, the great cow medicine.
Kow-Kure has a record of over twenty years' success in the prevention and cure of such diseases as Abortion, Barrenness, Retained Afterbirth, Milk Fever, Scouring, Bunches, etc. Most of these diseases spring from disordered digestive or genital organs, and Kow-Kure has strong medicinal qualities which tone up and permanently strengthen the entire system.
A trial is convincing. Kow-Kure is sold by feed dealers and druggists, in 50c and $1.00 packages. Write for free treatise, "The Home Cow Doctor."

erkshire Hogs—Milking Shorthorns
Breeding Stock For Sale
. A. Murphy, - Perkins, Cal.

Every time you buy an article, advertised in the Illfornia Cultivator, at the local store you do your rn some good.

acreages of rice are selling it at around $1.65 per hundred, making it cheaper feed than barley and corn at two dollars per hundred or better.

Rice in the bundle as it comes from the binder, threshed rice and rice straw has been the exclusive feed of many mules and horses used in the rice harvest, and I have heard of no bad results from it.

Since the rain a couple of weeks ago rice harvesting has been a slow and expensive process. It has been hard to bind, because the straw has been weakened by the rain and frost, and a big percentage has been left in the fields. In some places the fields are so muddy that it has been necessary to haul the bundles in to the machines on sleds, 15 or 20 bundles to the load. Threshers have increased the price of threshing to 30 cents per sack, the hauling cost has been increased, and some of the late rice will not sell for enough to pay the harvesting and handling cost. And much of the rice straw that is being threshed now is so nearly rotten that it is of little value. The lesson in this for next year is that the crop should be in early so that it can be harvested early. And any who want rice straw should fill their barns with the first threshing of the season before the fields are impassable and the rain rots the straw.

SAVED BIG MONEY IN BUYING DAIRY FEED

The following we find in "The Extension News," published by the Oregon Agricultural College at Corvallis. It is certainly worth considering.

Members of the Turner, Marion County, Cow-Testing Association let their association make them some easy money. They have known for a long time that feeding dairy cows makes them money, but they have just learned by practice how to make $5.37 more than ever before on a ton of mill feed. It was done this way:

Each of several men needed a few tons of mill feed and each knew that the others needed it. The tester for the association, Mr. Hanneman, took the lead and found out how much feed was needed, and despite their own excuses, such as "no place to store feed" and "no money to buy feed," they got together an order of 40 tons of bran and shorts. The local mill man was able on this large cash order to supply the feed at $25 for bran and $26 for shorts, while he charged $31 to the man who took a few sacks at a time and wanted 90 days in which to pay. The feeder who buys bran at $31 never gives the cow the amount of feed she would pay for, because he is paying 24 per cent interest on the $25 the feed could have been bought for. The man who had to go to the bank and borrow $75 in order to buy three tons of bran cooperatively with his neighbor, if charged 10 per cent interest for a 90-day period, saved $5.37 on each ton of feed bought and made it easier for the dairy cow to show a substantial gain over her cost of keep.

SUCCESS TO THE SHORTHORN ASSOCIATION

A much needed organization came into being when the California Shorthorn Breeders' Association was recently formed in San Francisco. The Shorthorn interests are more extensive in California than the average man realizes, and it is high time that some concerted action be taken by the breeders of the state to still further spread the good influence of the Shorthorn breed throughout the farms of the state. The new association begins its work under the direction of a particularly strong directorate and its work should prove of high value to California agriculture.

AYRSHIRE ANNUAL MEETING

The 42nd annual of the Ayrshire Breeders' Association will be held in New York, January 11, at Hotel McAlpin. C. M. Winslow of Brandon, Vermont, is secretary.

A reasonable degree of diversity is necessary for successful farming. Unless special or unusual conditions justify a highly specialized type of farming, a farm should have several sources of income to depend on. A man who is depending entirely on the sale of hogs is in bad shape if the cholera gets his hogs one year.

Time to think about a silo!

This is the month when a lot of men decide to order silos. They see how the cost of hay and feed *puts a crimp* in their bank-account. Around them neighbors with silos are *living easy.* They have a big fat cream check coming in every month.

Look around—talk with men who have an

INDIANA SILO

Have them tell you how the Indiana *saved* their frosted corn last Fall. How the *sweet,* succulent silage is keeping their cows *sleek* and *contented.* They don't worry over the high cost of feed, and there's no drudgery connected with the feeding.

Write for the Indiana Book—*free* to responsible farmers. Learn about the Special Discount to Early Buyers.

Santa Anita Rancho
Anoakia Breeding Farm

ARABIAN-THOROUGHBREDS: Two-year-olds, sired by Imported Stallion Ibn Mahruss, head of our Arabian stud. Dams are the choicest thoroughbred mares of Santa Anita Rancho.

SADDLE HORSES: Some of which were sired by Ibn Mahruss, world renowned imported desert saddle stallion, and Don Castano, a five-gaited Kentucky saddle stallion. These horses are mostly three-year-olds.

POLAND-CHINA AND BERKSHIRE BOARS: Four to nine months old. Sired by famous Poland-China herd boars, Banker's Boy and Glenview Wonder. And Berkshire boars, Kintyre Laird, Grandson's Duke and Fashion's Longfellow 5th. The dams are from the very best blood lines. Most all these animals have winnings at World's Fair. Write for catalogue.

HOLSTEINS: We will sell a number of young bulls. Some sons and grandsons of the noted Prince Gelsche Walker, and bulls from one World Record cow and two California State Record Cows. Write for details.

Live Stock Field Notes

ITEMS PICKED UP BY CULTIVATOR FIELD MEN

W. F. Holt has purchased a 5000-acre tract in Ventura County which he plans to stock with Hereford cattle.

J. A. Clark of San Joaquin County has sold this fall several high grade Holsteins and about $500 worth of pure bred Poland-China swine.

H. I. Marsh of Stanislaus County has just sold seven gilts to H. E. Carr, vice president First National Bank of Porterville, for the Boys' Pig Club.

M. M. Holdridge of Stanislaus County has erected a 90-ton Indiana stave silo. Has recently sold a bull to Shore Acres Dairy Farm and a bred heifer and a bull to Dr. L. Clark.

The Milk Products Company of Delaware, which installed a casein factory at Modesto some months ago is installing another plant at Crows Landing. The company recently made its first shipment of two carloads of casein to paper mills in Maine.

H. L. and E. H. Murphy are having their usual heavy demand for registered Shorthorns and a number of good sales have been made recently. It is likely that Harry will make another trip East soon to bring out two or three cars, mostly to fill orders.

raising hogs are realizing more and more the benefits derived from using good boars.

Hale I. Marsh reports sale of Poland-Chinas; four boars to Red River Lumber Company, of Lassen County; one boar to R. E. Spong, Fresno County. Mr. Marsh says that he is receiving considerable inquiry for breeding stock. He built a 67-ton silo the past fall and filled it with good old Yellow Dent corn which went about 15 tons per acre.

Butte City Ranch starts in the Shorthorn game by a purchase of 17 head of top notchers from G. A. Murphy and H. L. and E. H. Murphy, sixteen head of females and a finely bred herd sire, Violet's Coin. His sire, Gold Coin, by Secret Sultan, by Missie's Sultan with an equally high quality of dams tracing back to his great grand dam, Imported Roan Ribbon.

Thornton S. Glide, proprietor of Hillcrest Stock Farm, recently made an important addition to his herd of registered Shorthorns by the purchase of two new herd sires. One of these was bought in the Portland sale, topping the sale at $1350. The other bull is a splendidly bred fellow of Cumberland type and Villager breeding and was bought at a long price in the Middle West.

Waiting for Dinner
Youngsters on the ranch of Mrs. M. M. Holdridge, owner of one of Stanislaus County's successful dairies.

F. A. Herroux and Mrs. M. A. Haupert of the Buenna Aalta Ranch have just added eleven head of registered Holsteins to their herd. They all came from the herds of Wm. Bishop and other Washington and Oregon breeders.

Arlington M. Smith has just bought a bred Berkshire sow of the Murphys. Her name is Clementina and she was the champion sow at Modesto, at Pleasanton, at Fresno, at Hanford and the second aged sow at Sacramento 1916.

The Utah Milk Company, manufacturers of Sego Condensed Milk, have selected Galt as the location for their first California plant. It is expected that this company will install several other condensaries in California later on.

Winona Ranch of Oregon announces it will consign to the Western Berkshire Congress sale one of its prize winners of the last fall show circuit. This is Winona Laurel Violet 2nd, winner of many blues. Other noted consignments will be made from this same ranch.

When one looks about for junior two-year-old Holstein heifers that have produced over 500 pounds milk in seven days hnder official test, he appreciates better the great record of 505.1 pounds milk in seven days, recently made by McCloud De Kol Parthenia, owned by the McCloud River Lumber Company.

Changeling Tidy Abbekerk Wayne, the latest Holstein cow to make over 40 pounds butter in seven days under official test, is by the same sire as Tidy Abbekerk Princess Pauline, the dam of King Alcartra Abbekerk, the great young bull heading the registered Holstein herd owned by Bridgeford Company.

H. E. Cornwell of Stanislaus County reports that his Holstein cow, Abbie De Kol of East Bank 2nd, has completed a seven-day test with a record of 26.26 pounds of butter. She is on a yearly test and entered for the University Dairy Cow Contest. Mr. Cornwell plans to make other entries in this contest.

Fred W. Kiesel, who is building up a fine herd of registered Holsteins, will have a good bunch of young cows and heifers to go on official test within the next few months. He now has his feed growing well in hand and when official testing commences in this herd there is a promise of some good records to report.

J. A. Crawshaw announces the sale of two boars to Frank Pelissier & Co. and W. Zindars, the latter through the Cultivator advertisement. He also reports numerous inquiries from various parts of the state for boars, showing that those

H. H. Gable of Yolo County has purchased a two-year-old Shorthorn bull, Prince Arthur, from the Gudgell & Simpson, Missouri, herd. He is of strong Anxiety breeding and is a fine outstanding individual. Mr. Gable's stock is all in fine condition. He now has 24 breeding cows. He says his calves are the best he has ever raised. He will fit a show herd for the 1917 state fair.

W. A. Young of San Joaquin County has recently purchased of Hale I. Marsh of Stanislaus County a boar and sow whose breeding is from Thos. F. Walker & Son's Blue Valley herd of Nebraska; also an almost perfect gilt from Isaac Overton, Iowa. She is a splendid individual, Alpha Big Knox. Mr. Young reports a recent sale of a bred sow to A. A. Quackenbush of San Joaquin County.

The Fifteenth Holstein Cow to produce over 40 pounds butter in seven days is now reported by M. H. Gardner, superintendent of Advanced Registry. This record was made by Changeling Abbekerk Wayne, whose sire is Changeling Butter Boy, and whose dam is Tidy Abbekerk Princess Aline, a daughter of Tidy Abbekerk Prince. Her seven-day official record is 588.3 pounds milk and 40.62 pounds butter.

Four Purebred Guernsey Cows are now on semi-official yearly test at the stock farm of A. B. Humphrey. Some remarkable showings are being made. Fairy of Alfalfa Farms, a senior four-year-old, made a 7.33 per cent average test for her last six milkings. Golden Maid of Maple Lane has made over 400 pounds of fat in eight months, carrying calf the last five months. These are just a few of Mr. Humphrey's good ones.

Jay Dutter, manager of the Henderson Company, reports that they now have 170 head registered Holsteins. The company has sold to the government school in Honolulu a two-year-old bull, grandson of Colantha Johanna Lad. They also have herds of O.I.C. and Duroc-Jersey swine. A recent addition is a Duroc-Jersey boar of great quality that was grand champion at the Oregon State Fair this fall.

Butte City Ranch of Glenn County is one of the leading pure bred live stock establishments on the Pacific Coast. In addition to the Berkshire hogs this institution now has a herd of 40 registered Shorthorns, a flock of registered Shropshire sheep and a number of Shetland and Welsh ponies. The individuals in all of these herds have been selected with great care and represent some of the best blood lines in the respective breeds.

A visit to Rucker & Coppin's Ranch 13 last week found Mr. Rucker busy as a bee making new quarters for his fine Duroc-Jerseys. He has recently sold some fine hogs for foundations at good prices; to A. A. Trueblood a junior yearling sow that was second prize at Omaha National

New Ford Joke Book 1917
All the latest jokes on the Ford Auto. Hundreds of them and all good ones. Spring a new one on your neighbors. Large book with colored cover by mail. 10c
NEW ENGLAND PUBLISHING CO.
Box 500 So. Norwalk, Conn.

Stock Show, 1916, $400; a March boar at $400; to H. P. Eakle Jr. a junior yearling sow $240; to Henry Elson a May boar pig $200, a junior yearling sow, $185, and two spring gilts at $200 each.

Guy H. Miller reports that Lorita of Venadera has just completed a yearly test with a record of 603 pounds butter. Aldine of Venadera, junior four-year-old, has also finished her year's test, making 480 pounds butter with a 4.07 average per cent of fat. This is the largest yet made in the herd. Mr. Miller has recently sold a heifer to A. J. Morey of Glenn County; two cows to E. J: Wilson of San Joaquin County, and a bull to Geo. A. Foote of Stanislaus County.

W. J. Higdon can rightfully wear a wide smile these days. It will be remembered that Mr. Higdon recently purchased Prince Riverside Walker, son of Prince Gelsche Walker and out of Aaggie Acme of Riverside, the dam of Aaggie Acme of Riverside 2nd, who recently established a new state record by producing 35.36 pounds butter in seven days in the Morris herd. A son of Prince Gelsche Walker out of a 28-pound dam with a 35-pound daughter is some bull in this day.

The registered Shorthorns at Roselawn Stock Farm, owned by the estate of T. B. Gibson, find great favor in the Northwest where there is a real appreciation of quality. At the recent Pacific International at Portland, Roselawn Shorthorns won a liberal share of prizes, and in the public sale ranked among the leaders in selling price. The breeding herd at Roselawn is being gradually increased in size, but it has not yet sufficient capacity to meet the demands for breeding stock made upon it.

Lottie Walker Spofford 3rd, whose sire was the King of the Blacks and Whites and whose dam was Lottie Walker Spofford, has just made records on the Henderson Company ranch of 21.06 pounds butter for seven days and 82.21 pounds butter for 30 days. Bessie Oakes Segis, a junior two-year-old, in eight milkings gave an average test of 6.3 per cent fat; the record for five days showed a test of 5.33 per cent of fat. Under the rules of the association this record is such as to call for a retest.

Official Production of registered Holstein cows has been advanced another notch by the latest performance of the South Dakota cow, Hester Aaltje Korndyke. This cow was recently credited with an official seven-day record of over 42 pounds butter, but has since increased her record to 46.77 pounds butter in seven days and was still on test. She thus displaces Ormsby Jane Segis Aaggie, 44.42 pounds butter in seven days, as the world's champion butter producer for the seven-day period.

Aaggie Acme of Riverside 2nd, the great young Holstein cow that recently established a new California record by producing 35.36 pounds butter in seven days, has now broken the state record for 30-day butter production by a wide margin. Up to date her best 30 days' butter production is over 141 pounds and she is still gaining. This exceeds by over 11 pounds the previous record held for some years by Riverside Sadie De Kol Burke. Aaggie is owned by A. W. Morris & Sons.

A. B. Humphrey of San Joaquin County is building a model hog house for his Berkshires. It is 126 x 32 feet with a 26 x 26-foot wing for a feed house. It is well built with concrete floors, feed and water troughs. There are 22 10 x 12 pens, breeding pens, platform scales, dipping tank. An eight-foot alley gives ready access to all parts of the house, which is well lighted with modern non-draft windows. Charlie Maurer, Mr. Humphrey's able herdsman, reports recent sales; one sow to L. H. Smith, Stanislaus County; two sows and boar to F. G. Krauss, Hawaii; one boar to J. S. Gibson Company; one boar to John S. Craig; one sow to H. K. Hammond; two sows to Arlington Smith, Tulare County; one sow to Dallas Baches, San Benito County; one boar to Superior California Land Company.

J. H. Harlan Company of Yolo County have a corking good lot of heifers coming on in their herd of registered Holsteins. These are practically all daughters of Prince Gelsche Walker, King Korndyke Pontiac and King Mead of Riverside, the latter being the sire of Aaggie Acme of Riverside 2nd, who has broken two California butter records by producing under official test 35.36 pounds butter in seven days and over 141 pounds in 30 days. Most of these heifers are out of dams with creditable A.R.O. records and plans are being made to do official testing in a thorough manner in this herd hereafter. The splendid breeding of these heifers, their high individual excellence and growthy appearance all indicate some real doings when they freshen. The Harlan herd is now headed by a son of King Valdessa out of a 30-pound four-year-old. He is an outstandingly good individual, almost white in color. His half brother, Finderne Mutual Fayne Valdessa, sold at public auction in Portland, Oregon, recently for $21,500, the highest price ever paid for a bull calf at public sale anywhere in the world.

Alexander and Kellogg write regarding the importation of English Milking Shorthorns which arrived at Innisfail Farm December 17 that they are a fine bunch of cattle. The shipment consists of six young cows, six heifers, one bull and four calves. The cattle were selected with great care by Frank Peer, the importer, and are from the best milking Shorthorn herds in England. All the six cows have good milk records, one, a five-year-old, having a record of 9952 pounds, another, a four-year-old, having a record of 8360 pounds with first calf. They are large framed cows, showing beef as well as milk. These cattle are from the north of England with the exception of the bull and two heifers. In his description of them Mr. Peer writes; "These north country animals have had no special care or feeding to enable them to produce big records. Most of the records are made on grass alone. They are to the dairy born, tough and hardy, can stand hard work, are good and know how to grub for a living. They will improve with any kind of a fair chance and treatment." The bull, Kelmscott Viscount 19th, is from the famous herd of R. W. Hobbs Sons and is a fine type of the dairy Shorthorn bull, with good back and spring of ribs. He is splendidly bred, his pedigree showing large milk records for several generations on both his sire and dam's side.

Calf at World's Record Price, $21,500

A new world's record price for a bull calf at public sale was established when J. G. von Herberg of Kent, Washington, paid $21,500 for Finderne Mutual Fayne Valdessa, a ten-month-old Holstein-Friesian bull calf, at the Portland Sixth Pacific International Livestock Exhibit, Friday, December 8.

The buying of Finderne Mutual Fayne Valdessa was not a two-handed affair. More than a half dozen breeders came to the sale for the express purpose of buying this bull. When he was led into the tent the buzz around the ring quieted in anticipation of the coming sensation. Colonel Gue recited briefly the outstanding features of the young bull, referring to his pedigree, which he said was considered to be a record of marvelous achievement in production lines, records back of every ancestor of the 14 constituting the three generations shown in the pedigree. Before he had gotten half wound up on calling for bids to start the calf, a breeder broke into the oratory with a bid for $1000. The price quickly climbed under the spirited bidding to $16,000, when the field narrowed down to two. At $21,500 Mr. von Herberg bought the coveted bull calf and hung up a Pacific Coast record for a bull (of

any age) and an international record price for a bull calf at public sale.

The dam of Finderne Mutual Fayne Valdessa is Finderne Mutual Fayne, who has the world's record for butter for year (1200.64 pounds) as a junior two-year-old, exceeding the previous record by over 200 pounds. Freshening as a three-year-old, she produced almost 37 pounds in one week.

The sire of Finderne Mutual Fayne Valdessa is King Valdessa, whose two nearest dams average 43.03 pounds butter in seven days, the world's highest average.

Poultrymen Organize

Live Bunch of Poultry People Financing a Strong Marketing Organization

POULTRYMEN are looking forward to a more successful year. The casual observer may ask, "Why?" at a time when poultry products are lower than usual and poultry feeds are higher than ever before. We may say that the why lies in this that organization offers opportunity for cheaper production and better returns. Under the leadership of the state market director poultrymen of the Northern end of the state have organized with a membership representing nearly 1,000,000 hens, and now comes the organization of poultrymen of the Southern end of the state with a representation of 500,000 hens. But the best feature of this organization is that the members are not marketing the product of their hens through these associations as outside organizations but as organizations to which their own energy and best effort is essential to success.

We attended the final meeting of the Southern California Association held in Los Angeles December 28, and it was an inspiration to see the unity of action and the deep interest taken by every member in every vote. Poultrymen of Southern California have been organized for the past two years. They have conducted a business on Boyd Street which has been of material advantage in the purchase of supplies, but the association has not been strong enough. It is undercapitalized and its principal object up to the present has been simply the purchase of supplies. But with the great increase in poultry production the demand is more insistent for careful distribution of the product. A strong board of directors has been elected. Now comes the working out of details.

One detail already arranged is that the Stanley Produce Company of Los Angeles will handle all of the eggs of the Southern California producers. The old association has operated during the past year through the Simpson Fruit & Produce Company. The transactions have been entirely satisfactory but the Stanley Company offered a rather more advantageous contract.

The ten directors elected are: J. M. Davidson, Riverside County; Wm. Brandt, San Bernardino County; Thomas Hurley, San Diego County; W. R. Grubb, Orange County; C. G. Ross, Frank P. Smith, M. A. Schofield, B. R. Holloway, W. L. Trewitt, Elliott Brett, all of Los Angeles County. After the adjournment of the general meeting the directors met and elected J. M. Davidson, president; C. G. Ross, vice president; Frank P. Smith, secretary and treasurer; M. A. Schofield, chairman executive committee. Other members of the executive committee are Austin Martin, credit manager for the First National Bank of Los Angeles, elected to represent Mr. Weinstock on the board, and G. W. Belden of Los Angeles.

Mr. Weinstock was present and referred to the fact that consumption at the present moment was not up to production. This assocation must take hold of the situation and minimize the ills and approach as nearly as possible to the ideal, and in approaching this ideal he passed the problem directly to the producers and endeavored to show wherein a cooperative organization meant the best thought and the best work of every individual member. There will be opponents who will do all in their power to lower the efficiency of the organization. The outsider may possibly get better immediate returns than those in the association but the more long-sighted must hold the organization together and make every appeal to the fairness of the other producers not to lessen its efficiency. Above all, be patient. Your directors and your members will make mistakes. There is no one but does and complete success can only be secured by patience and determination to win in the face of opposition.

Wonderful Egg Producer

Any poultry raiser can easily double his profits by doubling the egg production of his hens. A scientific tonic has been discovered that revitalizes the flock and make hens work all the time. The tonic is called "More Eggs." Give your hens a few cents' worth of "More Eggs" and you will be amazed and delighted with results. A dollar's worth of "More Eggs" will double this year's production of eggs, so if you wish to try this great profit maker, write E. J. Reefer, poultry expert, 4261 Reefer Bldg., Kansas City, Mo., who will send you a season's supply of "More Eggs" Tonic for $1.00 (prepaid). So confident is Mr. Reefer of the results that a million dollar bank guarantees if you are not absolutely satisfied your dollar will be returned on request and the "More Eggs" costs you nothing. Send a dollar today or ask Mr. Reefer for his Free poultry book that tells the experience of a man who has made a fortune out of poultry.—Adv.

ORNAMENTAL PLANTING

Continued from Page 11

Perennial Border

Clean and prepare this for planting. Violets may be secured or existing roots divided and planted out. These will do well in partial shade: Princess of Wales, Marie Louise and Double and Single White make a pleasing selection. Violas may also be planted out now. They make a splendid edging plant in one color, or used for carpeting beds of roses, etc., are unequalled. The best varieties are Mauve Queen, Purple Queen, Lutea grandiflora (yellow), and White Perfection.

The double form of Bellis Perennis, or daisy, may also be planted for borders and Myosotis (forget-me-not), primroses and polyanthus, etc. Arabis alpina and aubretia are also beautiful early spring flowers which may be planted this month. Secure choice varieties of all types of iris, English, Spanish, German and Japanese, not forgetting the Mourning Iris.

Climbers

Tie up all climbers and cut out dead wood.

Queries

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Storing Butter

Answering an inquiry as to putting down or pickling butter, S. L. Denning of the university farm writes:

"From your subscriber's letter I would judge that he wishes to store unpasteurized butter either by putting it in a brine or by packing in tubs. Unpasteurized butter does not give satisfactory results when stored for any length of time, but if it is to be stored it should be made out of the best cream possible, preferably sweet cream. It is often hard to make butter out of sweet cream by the methods used on the farm. The butter should contain not more than two and one-half per cent of salt for this purpose.

"Butter is pickled by putting it in wooden kegs or stone jars and covering with a salt brine. Butter for this purpose should be from the best cream. It is churned, washed, salted and worked in the usual way and then made into one or two-pound prints which are wrapped in parchment paper. The prints are then packed into the keg or jar and covered with a 20 per cent salt solution. This solution would be about one pound of salt to five pounds of water. It is well to line the keg with cheese cloth before using. This butter should then be kept in as cold a place as possible and the butter kept well under the surface of the brine.

"The ordinary method of storing butter is to pack it in tubs or cubes and place in a cold place. The tubs or cubes should be covered with a thin coat of paraffine on the inside and well lined with parchment paper. We would not expect this butter to keep perfectly, as the subscriber wishes, on account of the bacteria it will contain, due to not being pasteurized and also to the high temperature of ordinary farm storage. We are informed that some degree of success has been met with in the pickling of farm butter, but just how long it will keep we are not at present in a position to say."

Permanent Exposition

A subscriber writes asking the location of the permanent exposition grounds pictured in a recent issue. Will say these occupy the grounds held for years by the Sixth District Agricultural Fair Association, within the limits of the city of Los Angeles. The Grand Avenue or Jefferson Street yellow cars or the Interurban Gardena line all pass the grounds. The exposition is well worth a visit and no admission is charged.

Rabbits Eating Beans

Please advise how to prevent depredations of rabbits to Lima beans planted on an unfenced hillside. Last year I sprayed with Paris green, but only succeeded in killing the beans.—Subscriber, Santa Ana.

Beans do not take kindly to arsenical sprays. Where rabbits cannot be readily shot, snared, or trapped, they may be destroyed over limited areas by means of poison. A few small crystals of strychnine should be inserted in pieces of sweet apple or cabbage leaf and these pieces impaled on stakes two or three inches above the surface of the ground along the runways. Some find it is cheaper to feed the rabbits than to try to trap or destroy them. In such case winter prunings or refuse corn, cabbage or other products are left for them to eat in the hope they will take it in preference to more valuable crops.

BIG SEED COMPANY
IS DISTRIBUTING NEW CATALOG

Aggeler & Musser Seed Company
OF LOS ANGELES
Issue 24th Annual Book

One of the largest seed houses in the West, the Aggeler & Musser Seed Company, Sixth and Alameda Streets, Los Angeles, have just received the first edition of their new 1917 catalog and are giving it broadcast distribution. This is their 24th annual catalog, and it certainly surpasses any previous edition.

It contains many new features, such as hints to the home vegetable gardener, how gardening may be made easy, etc. In fact, the supplementary booklet called the "Garden Manual", which heretofore has been printed separately, is this year incorporated in the big annual, and it is claimed to be one of the most complete seed books published. It contains answers to more than 1000 questions and gives information regarding all varieties of plants listed and is fully illustrated. Not only does it tell all about seeds, but gives full data concerning the correct tools and implements agriculturists should use to obtain the best results. Valuable hints on poultry, fertilizing and the use of insecticides are also given.

The Aggeler & Musser Seed Company will gladly send this descriptive, illustrated and interesting catalog, free and postpaid, to anyone writing and requesting it.

LUITWIELER PUMPS

2 irrigation booklets free. Install this famous pump. Eliminate trouble. Cheaper water. Perfect service. Luitwieler Pump. Eng. Co., 707 N. Main, Los Angeles.

Household Department

THE CRY FROM THE CONSUMER

Grasshoppers roam the Kansas fields and eat the tender grass
A trivial affair, indeed, but what then comes to pass?
You go to buy a panama, or any other hat;
You learn the price has been advanced a lot because of that.
A glacier up in Canada has slipped a mile or two—
A little thing like this can boost the selling price of glue,
Occurrences so tragic always thrill me to the core;
I hope and pray that nothing ever happens any more.

Last week the peaceful Indians went a-searching after scalps,
And then there was an avalanche 'way over in the Alps;
These diametric happenings seem nothing much, but look—
We had to add a dollar to the wages of the cook.
The bean crop down at Boston has grown measurably less,
And so the dealer charges more goods to make a dress.
Each day there is some incident to make a man feel sore,
I'm on my knees to ask that nothing happens any more.

It didn't rain in Utah and it did in old Vermont—
Result: it cost you fifty more to take a summer's jaunt;
Upon the plains of Tibet some tornadoes took a roll—
Therefore the barons have to charge a higher price for coal.
A street car strike in Omaha has cumulative shocks—
It boosted huckleberries up to 20 cents a box.
No matter what is happening it always finds your door—
Give us a rest! Let nothing ever happen any more.

Mosquitoes in New Jersey bite a magnate on the wing—
Result: the poor consumer feels that fierce mosquito's sting;
The skeeter's song is silenced, but in something like an hour
The grocers understand that it requires a raise in flour.
A house burns down in Texas and a stove blows up in Maine,
Ten minutes later breakfast foods in prices show a gain.
Effects must follow causes—which is what I most deplore;
I hope and pray that nothing ever happens any more.—Wilbur D. Nesbit.

ECONOMY AND THE HIGH COST OF LIVING

Written for California Cultivator
By Mrs. A. Stainton

LET us suppose there are three women living in an immediate vicinity who have houses and families of the same size, move in the same society, etc. The same circumstances surround each, and the demands are the same on each. We assume there are two adults and three children in each family and no servants. Ten dollars and 50 cents a week is given the wife for the purchase of food for the family.

Family One has ample, is happy, well nourished, and has a general air of prosperity. Family Two has enough to eat, but there is little variety, there is less happiness, and the struggle to make both ends meet is apparent. Family Three is in debt. Father and mother are harrassed, nervous, and fretty, children not well nourished, and the doctor's calls are frequent, also there is more or less unhappiness. We have all seen this condition about us. What is the matter? The answer is simple. Number One knows her business. She has learned economy and knows how to use the money so as to obtain desired results, and she also knows what these results should be. She is using just as much money as the other two but she is getting more for it. Number Two has learned some things, but not enough before she entered this practical business of household administration. So she is having a harder time but, still learning, is accomplishing with difficulty what One does with ease. Number Three is a failure so far as her business is concerned. She is a loving wife and devoted mother, but she is the same kind of failure her husband would be if he failed to provide enough money to buy sufficient food. That the amount is enough One and Two prove.

All women ought to see that the use of money for or in the administration of the business affairs of the house differs in no way from that of its use in the business which supports the house. The man who knows how to buy can usually sell to advantage. He who does not know values cannot do this. What is it one must know in order to have the $10.50 weekly buy ample food for a family of five, and can it buy the kind of food anyone wants to eat? A warning is necessary at this point. Just because $10.50 is adequate in certain places does not mean it is in all and under all circumstances. Ten dollars and 50 cents a week may not adequately feed a family of five hearty, hard-working men. It might not provide food for five farm hands if everything had to be purchased at the market. It should, but it might not.

The second point to remember is that the amount given refers to the raw material, not to the finished product into which labor and fuel have gone. What selection of raw material and amounts must be purchased to feed the family of five on $10.50 a week? Space forbids touching foodstuffs and prices, what the body needs, energy producers, value of cereals, so we will take the three wastes: Waste in marketing, including purchase of inedible material; purchase for flavor and tenderness instead of nutrition; and sheer extravagance. Waste in supplies and cooked food and loss in storing foods which deteriorate. Waste in preparation, including preparation of too large quantity per meal a day; food made inedible by poor cooking; and food made unwholesome by wrong cooking.

Take the first. Food as purchased in the market is composed of an edible portion such as flesh of meat, the yolk and white of the egg, the peas in the pod, the corn on the ear, etc., and a nonedible portion, such as bones, skin, shells and so on. When the food reaches the house we again divide into edible portions, waste and refuse. The waste is that we may or may not use. We may pay for it and neglect to bring it home. We buy chops, a steak, or a rib roast and say we want them trimmed. We pay for the trimmings but unless we ask for them the butcher does not put them in the package, and there is good material in them, too. This is waste, for these trimmings are not refuse. They yield something which may be used in cooking even if not eaten just as meat or fat. Economy in buying. The purchase of canned good by the dozen at least saves the price of one can if you have a place to keep them purchased this way. The waste of peeling potatoes before cooking, or not using rice in place of potatoes when the latter cost so much, not knowing how to select meat, the waste caused by haste in cooking, hence the demand for very tender, quickly cooked materials; the rejection of many parts of vegetables which properly cooked make palatable dishes, and the leftovers, a spoonful of vegetables, any sort, a piece of cake, bread, pie, a tiny bit of meat or fish, nothing too small to save and serve in the thousand and one ways that suggest themselves to most housekeepers. The purchasing from day to day over the phone is a wasteful habit. All those may appear trifles and fussy but it is the little foxes that spoil the vines. The saving may seem small, but it is worth a trial and will amount to from 20 to 50 per cent of the yearly expenditure for food.

There is an unexplained idea that a cheap food is not delicious. This is a wrong attitude to the so-called cheaper foods perhaps caused by lack of skill in cooking. The first error in buying food materials is to buy the costlier articles when things much less expensive can yield as much nourishment, and buying food which is out of season. Food is actually in season only when it is being produced in the section where one lives

There is a frequent cutting down and out in the wrong place. Boycotting eggs or butter has never served the purpose for which it was instituted. It is an unintelligent way of attacking a problem which needs a wise adjustment rather than attempted force. When eggs are high plan those foods which require less. Muffins, cakes, and desserts calling for eggs in the making may become a luxury many times. There is far too little known as to which foods yield certain things to the body, and a consequent lack of balance. The bread and milk, and bread and molasses of our forebears developed some fairly lusty

specimens of men and women on limited means.

I could say a whole lot more but will only add a short illustration of how a leg of lamb weighing seven pounds can be stretched to provide at least four good dinners for our average family of five. First day. I have it freshly roasted and serve mint jelly, boiled rice, peas or asparagus. Second day. I have it sliced and cold but start dinner with a good hot soup and serve with the cold lamb a salad of lettuce and chopped mint with French dressing. Creamed potatoes usually accompany this dish and cheese and crackers or fruit follow. Third day. Neat slices of cold lamb dipped in a mixture of chopped parsley, bread crumbs and beaten yolks of eggs and fried to a golden brown. Meanwhile have ready either a puree of spinach or cucumbers very hot and poured on hot dish, lay meat on top and serve. Fourth day. The bones make a good soup with an onion and other vegetables cut fine (thicken soup with pearl barley). Remainder of the meat is minced. Line a slightly buttered bread pan or quart brick mould with hot and cooked macaroni and tomato, having walls almost an inch thick. Fill the center with minced and highly seasoned lamb, cover with macaroni and tomato, set in a pan of hot water, cover with buttered paper and bake one hour. Turn on to a hot platter and serve with tomato and okra with curry or plain tomato puree. I learned to appreciate the flesh of sheep in New South Wales. I used to look upon lamb and mutton as a homely sort of dish, but now I consider it delicious.

WINTER RECEIPTS

Butterless, Eggless, Milkless Fruit Cake.

One pint and one-half orange marmalade, one whole lemon, chopped, use juice also. One pint preserved figs, one pound strained honey, one cup sour grape juice, or any acid fruit juice, one glass hot water, heaping teaspoonful baking soda, dissolved in hot water, one cup ground almonds, one half- cup chopped peanuts, three pounds Thompson's seedless raisins, floured, one cup white sugar, one and one-half cups Crisco or Cottolene, two tablespoons cinnamon, three teaspoons allspice, one-half teaspoon each ginger and salt, enough sifted flour to make rather stiff dough. Bake slowly in medium hot oven till not sticky when tested with straw. Bake in long dripping pan, first making a dough of bran and meal to cover pan half inch thick, then cover with greased paper and spread on your cake dough. This will keep a year (if hidden away), and should be made at least four weeks before Thanksgiving or holidays.—Aunt Polly, Kerman, Cal.

Candied Violets

Mix half a pint of water and half a pound of granulated sugar, and cook until it spins a thread. Remove from the fire and set in a pan of cold water. When partly cool, beat rapidly until partly crystalized. Have a quantity of stemmed sweet violets and drop in a few at a time. Stir gently. Lift with wire tongs on to oiled papers and let harden.

SOUTHERN GINGERBREAD

One cup of molasses, one-half cup butter, one teaspoon powdered ginger, one-half teaspoon powdered cloves, two teaspoons powdered cinnamon, one-half teaspoon powdered allspice, two tablespoons baking soda, three cups flour, two eggs, one cup boiling water, one teaspoon baking powder. All measurements level.

Beat the butter and sugar to a cream, stir in spices, beat thoroughly. Then add the molasses and the hot water, to which the soda has been added. Add the flour and the baking powder, and lastly the well-beaten eggs. Turn into a greased and floured tin and bake in a moderate oven until it shrinks from the sides of the pan.

Divide the gingerbread into blocks while warm and serve with a whipped cream dressing.

MACEDOINE OF VEGETABLES

Clean carrots and turnips and cut into fancy shapes or cubes. Use one and one-fourth cups of carrots and one-half cup of turnips. Cook separately in boiling salted water until soft. Drain and add one and one-fourth cups of cooked peas. Reheat in a sauce made of three tablespoons of flour, one cup of chicken stock and one-half cup of cream. Season to taste with pepper and salt, and just before serving add the yolks of two eggs.

DATE TAPIOCA PUDDING

Three tablespoons minute tapioca, three tablespoons brown sugar, two cups boiling water, juice of one lemon, one-half pound stoned dates.

Cook tapioca, sugar and water in a double boiler for 40 minutes, or until tapioca is clear. Remove mixture from fire and stir into it lemon juice and the dates. Serve cold with cream and sugar.

BRAN BREAD

One cup cooking molasses, one teaspoon soda, one small teaspoon salt, one pint sour milk or buttermilk, one quart bran one pint flour. Stir well and bake for one hour in a moderate oven. It may be baked as a loaf, or in gem pans, as preferred. The bread should be moist and tender.

CORY'S MAMMOTH Thornless Blackberry

No briers to tear the hands or clothing — an economy at harvest. The earliest berry to ripen — a guarantee of profit at market. A prolific bearer of gigantic fruit — insuring quantity. A luscious, almost seedless berry of unsurpassed flavor—the final requisite.

Thornless Quality is guaranteed. Affidavits furnished.

Supply limited. Booking orders now.

Delivery in February.

LIVE STOCK

Smith's Poland-Chinas—Sows and gilts bred to Joker, first prize boar at Wisconsin State Fair 1915. These sows and gilts were sired by Iowa Wonder, who is a son of the great A Wonder, the most celebrated Poland-China boar living or dead. Litters from this mating are the best I have ever seen anywhere. Prices low, quality considered. Will sell one or a carload. As a special inducement each purchaser will be given a year's subscription to the American Swineherd, the best swine paper published, and a copy of the Handbook on the Sow, also a copy of the Pig Feeders' Manual. Geo. A. Smith, Corcoran, Cal.

Grape-Wild Farm Berkshires — World's Fair Grand Champion Grand Leader 2nd heads our herd, not only himself a champion but the sire of champions. At the 1916 California state fair his daughters won all of the senior sow classes including the grand champion sow. At the 1916 Oregon state fair a Grand Leader sow was junior champion. We are offering a number of choice boars of exceptional breeding and are also booking orders for fall pigs. A. B. Humphrey, Escalon, San Joaquin Co., Cal.

Billiken Herd of Chester White Swine—Prize winners at the California State Fair and representing the best blood lines the breed produces. The farmers' real utility breed. Write for booklet "Chester Whites" and find out what they are doing. Four bred gilts due to farrow in January; 10 young service boars; 20 open gilts that will be bred to suit the buyer. Registered and cholera immune. C. B. Cunningham, Mills, Sacramento County, Cal.

For Sale—From 1 to 100 extra fine, straight, well marked, light colored, highly bred, registered Holstein heifers from 6 to 12 months old. They are rich in the blood of King of the Pontiacs, Pontiac Korndyke, Hengerveld De Kol, Rag Apple Korndyke 8th, King Segis and other most celebrated sires of the breed. Prices very reasonable. Write Geo. A. Smith, Corcoran, Cal.

D. O. Lively announces a trip East in January to buy pure bred stock for his own account. Commissions for customers executed with faithful accuracy. A lifetime acquaintance with the leading breeders of the middle states gives him a special advantage in making selections. Beef cattle, milch cattle, sheep and swine purchased. Write for terms, 216 Hobart Bldg., San Francisco.

Make Big Money with our Big Type Poland-Chinas. Smooth, easy feeders that make greatest weight in shortest time at lowest cost, topping the market at 225 lbs. in 6 months 300 head, both sexes, all ages, reasonable prices. Best Eastern blood lines. Satisfaction guaranteed. Ranch in Tulare County, but address owner, R. H. Whitten, 610 B. Security Building, Los Angeles.

HAY

Scott, Magner & Miller say under date of December 30:

Receipts for the past week were 1230 tons; previous week 1924 tons. The majority of arrivals are of the better grades, the poorer and medium grades selling readily at prices higher in comparison than choice grades. Alfalfa demand has been quite good owing to the scarcity of cheap grades of grain hay and several round lots have been reported sold in interior districts during the week. Straw remains unchanged.

Citrus Fruit Market

LOS ANGELES, Jan. 3, 1917.

Weather conditions have been more satisfactory in most of the Eastern markets and the fruit, which had been sidetracked before Christmas, is now practically all cleaned up. Shipments would be going forward more liberally if it were not for the storms preventing picking. Prices prevailing are fairly good. Shipments of oranges from Southern California are more than twice as heavy as last year same date. Central California however does not quite reach last year's total. Butte, Sacramento and other Northern sections have made their largest shipments ever.

The lemon situation is very quiet, shipments only sufficient to supply regular trade going forward.

Shipments

Shipments of oranges from Southern California to date since November 1, 1916, 2470 cars, lemons 744, total 3214. To same date last year, oranges 1140, lemons 904, total 2044. From Central California to date this season, oranges 3645, lemons 106, total 3751; to same date last year, oranges 3761, lemons 68, total 3829. From Northern California to date this season, oranges 823. To same date last year, oranges 549 cars.

PROGRAM CALIFORNIA SWINE BREEDERS' ASSOCIATION

Thursday, January 18, Blanchard's Hall, Los Angeles. Headquarters: Hollenbeck Hotel.

9:30 a. m., business session; 10, "The California Swine Breeders' Association," C. B. Cunningham; 10:10, "The Swine Business," Hon. Jas. Mills; 10:30, "Feeding Growing and Market Hogs," Leon L. Lamson; 11, "The Breeding Herd and the Pure-bred Business," Wm. Bernstein; 11:20, Discussion: Feeding Problems, Self-Feeders, etc.; 1:30 p. m., "Why the Prices of Swine in California are Lower Than in Oregon or in the Middle States," F. I. Washburn; 2:15, "Why Strictly Grain Fed, Milk Fed, Alfalfa Fed, and Acorn Fed Hogs All Bring About the Same Price in California," Frank Hauser; 3, "How to Market Hogs in California," Harris Weinstock; 3:35, "What Is Being Done and What Should Be Done for the Good of the Swine Industry in California," D. O. Lively; 7:30, theatre party.

Friday—8:30 a. m., killing demonstration at Cudahy Packing Co.; 10, cutting display at Wilson & Co. packing house; 11:30, inspection of plant and luncheon at Hauser Packing Co.; 1 p. m., visit to moving picture studios and other points of interest in Los Angeles.

The railroads have granted a rate of a fare and one-third on the certificate plan. —J. I. Thompson, Secretary.

ENLARGED BUSINESS

After engaging in the saddlery and shoe finding business for the past 17 years, under the name of the Los Angeles Saddlery and Finding Company, this firm is reincorporating under the name Lichtenberger-Ferguson Company. The same individuals, who have been associated with the saddlery house for years past, will continue to share the responsibilities of the new firm and the re-elected officers are: Louis Lichtenberger, president; Clarence Ferguson, vice president; George W. Lichtenberger, secretary; Roy R. Meads, assistant secretary.

Several lines of automobile accessories have been added, including the factory distribution of Norwalk Tires. The Norwalk Tire Company, at the corner of Pico and Hope Streets, Los Angeles, which is a subsidiary company to the Los Angeles Saddlery and Finding Company, will also hereafter be known as the Lichtenberger-Ferguson Company, and will continue to be the Los Angeles service station of the head concern.

Case 10-20

For Men Who Want a *Quality* Tractor

As farmers study and buy tractors more and more, the merits of Case Tractors are better appreciated. Quality is the first thing to consider, advise authorities. Wise men heed it. For quality means performance.

Careful farmers are more inclined than ever to turn to an old-established concern which has a record behind it, one that can afford to include construction superiorities. That was evident at the demonstrations.

From grandfather to father and son (this is our 75th anniversary) has passed the word that Case machinery may be depended upon. It is almost a farm proverb. This has decided hundreds to choose Case Tractors. Few can content themselves with lesser quality.

With 24 years of gas engine experience, Case has set the pace in the farm world for kerosene and gasoline tractors, of the higher grade, as it did in the steam engine field years ago, where it still dominates.

This preference for Case was proved last winter, when over 15,000 farmers wrote to us to inquire about these farm labor-savers. Hundreds of testimonials have come in from all over the country from satisfied, enthusiastic users. At the demonstrations, farmers saw for themselves the superiorities which Case can afford to put in its machinery, and made comparisons. Farm paper and agricultural college experts praise the performance and simplicity of Case Tractors.

Most people now concede Case leadership.

Announcing a Fifth Size

In addition to the four master tractors offered last season, Case now introduces the 9-18. This smaller size follows Case principles, and is built in the same honest and careful manner as the 10-20, 12-25, 20-40 and 30-60. All are made complete at the Case plant by Case workmen. The 9-18, though designed for smaller farms, is not too light, too small nor too cheap.

At the tractor demonstrations this summer the 9-18 created a profound sensation. Orders for hundreds were received from farm owners and dealers.

All know that Case Tractors have been approved after long and severe tests. Owners have the insurance that comes with owning a *proved* tractor, not an experimental one.

Announcing a Small Thresher

Another announcement of widespread interest is that Case now offers small, light threshing machines suitable for use with tractors. While these have all the well-known perfections of the larger Case Threshers, their capacity and price make it possible for each farmer to own his own thresher.

We have just prepared a new 1917 Case album in colors in commemoration of our 75th anniversary, which we think is the finest yet produced in the agricultural world. It is a book so replete with information of value to every farmer that no one can afford to be without a copy.

This catalog describes Case kerosene and gas tractors, Case steam engines, Case threshing machines, Case road machinery, Case automobiles, and every Case product. Write today for your copy. It is free.

J. I. CASE THRESHING MACHINE COMPANY, Inc., 161 Erie Street, RACINE, WIS.

An Attractive Poultry Yard

There's Money in the J. H. Hale Peach Where Others Have Shown No Profit

The J. H. Hale Peach

It will ship a thousand miles farther, bears when others fail, and brings the highest prices. It has outyielded and outsold Elberta and other peaches in carload lots in the country's greatest market. Wm. P. Stark recognized its merits and has propagated and sold it to satisfied growers in every section. In a few years you, too, will be much pleased if you plant them now.

Size. Averages ⅓ to ½ larger than Elberta.

Color. Golden yellow, overlaid with bright carmine.

Flesh. Solid, fine grained, tender, delicious flavor; perfect freestone.

Shipping. Only peach ever shipped in a barrel like apples. One crossed the continent twice and was received in good condition. Has kept 53 days in ordinary ice-box.

Ripening Season. Three days to a week ahead of Elberta.

Picking Season. Extended at both ends. Colors before ripe and hangs long on the tree.

Hardiness. Fruit buds are hardier than any large, fine yellow peach. Has stood drouth and severe cold when others in same orchard failed.

Profits. Mr. Hale received $1,420 from one acre. It has always brought him the highest prices alongside of the highest grade Elbertas.

Exclusive Contract. After testing this wonderful peach for 12 years, Mr. Hale was at last willing to have it bear his name. He contracted with Wm. P. Stark Nurseries to propagate and distribute this peach. The genuine, registered, trademarked J. H. Hale peach trees can be furnished only by the Wm. P. Stark Nurseries.

Read These Letters From Experts

From California. "The J. H. Hale is a very handsome, shapely peach. The fruit is fully ripe and juicy and its control of its own decay in a close mail package is very significant of its keeping quality. It is a very heavy, fine-fleshed peach, coarse fiber almost absent. The flesh is solid yellow to the pit wall, no excess of red color at the pit and no cavities around it. The pit cavity has, however, a deep, rich red—a perfect beauty for varieties in which this coloring is desirable. If vigor and bearing prove satisfactory, I believe the variety will have exceptional value in this state. If, however, it persists in being as much larger than the Elberta as is claimed, it will be hard to hold with one hand in California."—Prof. E. J. Wickson, University of California.

29 Days in Storage. "J. H. Hale peaches picked 29 days and in common storage, still good."—A. V. Underwood, Dufur, Oregon.

Fully Up to Your Claims. "One of my J. H. Hale trees bore ten peaches, one of which weighed nine ounces. Beautiful they were, flamed with vivid red and clear yellow. Good? Be assured they were fully up to any claim made for them. I have the fullest faith in the J. H. Hale peach for the home orchard and commercial planting. Shall be very glad to refer any who come this way to the J. H. Hale peach."—Geo. J. Streator, 254 Seaside Ave., Santa Cruz, California.

The Export Peach. "Another peach season has passed, and has been a success from every point of view. I have watched my two-year-old J. H. Hale orchard with lots of interest and on the whole am now more enthusiastic than ever, for while the buds showed much greater winter hardiness than Elbertas as I wrote you in the spring, I did not tell you that this region had a bad attack of curl leaf in the spring and all Elbertas not properly sprayed lost their foliage and crop, while hardly a leaf was affected on the J. H. Hale. Also, the fruit which showed on many of the two-year-olds was fully as fine as our finest Elbertas, which is remarkable for two-year-olds.

I have tested its keeping quality and I am now sure that, as I have stated before, it will carry a thousand miles farther than Elberta, and I can see that the picking season can easily be extended about ten days in advance of Elberta, and as much later."—Roland Morrill, Benton Harbor, Michigan.

Fine Shipper. Our three-year-old J. H. Hale trees averaged fifteen to twenty peaches to the tree. These peaches were 10¼ inches around, and weighed 10 ounces each. Far better quality than Elberta. We are so far from the market, the J. H. Hale will make a fine shipper, and it is very hardy."—H. A. Budgell, Yakima County, Washington.

Remarkable Endurance. "But these peaches would have gone from California to New York, could have been sent back to California and again to New York—three times across the continent with a margin of three days for examination, admiration and sale! And no refrigeration called for."—Parker Earle, Pasadena, California. (Note—Mr. Earle is a director of the Redlands Heights Ranch Co. They set out an initial planting of 14,000 J. H. Hale trees.)

The Delicious Apple

Always Brings Highest Prices
More Widely Known

William P. Stark was the first to recognize the merits of this great apple. He named it "The Delicious" and had the foresight and courage to propagate it and to urge growers to plant it. Its great beauty, delightful flavor and fragrant aroma, make a lasting impression on the mind of the consumer.

Its vigor, hardiness, productiveness and shipping quality delight the grower. It is a consistent, top-notch money maker.

"The Delicious is in great demand here. One orchardist with 51 trees picked 259 boxes, for which he received $2.00 a box here at home. He could easily get $2.50 for them."—R. S. Purtee & Son, Paonia, Colorado.

"I have on hand a bushel of Delicious apples for which I paid the small sum of $4.00."—Alfred Bonsecours, Topinabee, Michigan.

Harvey Service on Santa Fe recently bought 300 boxes of Delicious at $3.00.

Expert Growers Endorse Our Trees

Our healthy, vigorous trees, with unusually heavy roots, have pleased large buyers in practically every fruit growing section of this country. Our trees are pruned in the nursery to suit your needs and often come into bearing a year or more sooner than ordinary trees. We guarantee true-to-name, safe arrival and the passing of the most rigid official inspection.

"Your trees are the hardiest, best rooted stock we receive, well packed and in good condition. Were I to order trees for myself, I would order them from your nursery."—H. B. M. Hall, Quarantine Inspector, California.

We Sell Direct-From-Nursery Only

We have no agents, but eliminate agents' commissions and many causes for dissatisfaction, such as mixing labels, delays in delivery, misrepresentation, etc. Our responsibility is not second hand. To secure reliable information, high quality and safe delivery at reasonable price, buy direct from our catalog.

1917 Catalog—FREE

Our catalogs are used in horticultural classes in many schools and colleges.

It describes the varieties whose worth has been proved by experience. You can find what you want easily and quickly.

"Your catalog has been received and read through with a great deal of interest. I like the direct way in which you describe the different items, and the method of appending the prices of each in plain figures. This will be a book that I shall refer to often, because the matter is so conveniently arranged and so complete."—W. S. Howard, Ass't Prof. of Horticulture, University of California.

California Cultivator

Vol. XLVIII No. 2 LOS ANGELES: January 13, 1917 One Dollar Yearly

Mid-Winter Poultry Show at Los Angeles

Poultry Breeders Association of Southern California Conducts a Most Successful Exhibition. Strong Showing of American Breeds. Mediterraneans Light in Number but of Fine Quality. Written for California Cultivator by Mrs. J. A. Koethen

CACKLES and crows and peeps and chirps, along with a sprinkling of gobbles and quacks, filled the two floors of the old Emporium at Tenth and Main for a full week and lured many an unwary passer-by to stop, look, listen, and if he was human, to lose his heart to one or more of the poultry queens on dress parade there. I watched one fancier—he

First White Leghorn Cockerel

At the Poultry Breeders' Association of Southern California show, first S. C. White Leghorn cockerel and A.P.A. special, best cockerel in Mediterranean class. Owned by Emerson and Mumford.

talked like an expert, and bystanders whispered that he was from Petaluma—holding a pretty Barred Rock pullet while he discoursed on her fine points, and he held her as tenderly as a man holds his sweetheart. She nestled comfortably in his arms, too, though he was a stranger, like one who knows she is loved and appreciated.

The great midwinter show of 1917 may not go down in history as the biggest show ever, but it was full of interest and significance. According to the official catalogue, 2036 birds were entered. Of these, the poultry (chickens, ducks, turkeys and geese) numbered 1481, rabbits, 190; pigeons, 350, and carriers, 15. In addition to these there are some very handsome pheasants, an interesting window exhibit of pet stock and a few fur-bearing rabbits, which looked extremely comfortable in the chilly show room.

As nearly always happens, the Rocks, all varieties taken together, outnumbered all other breeds, totaling 237. Barred Rocks led with 94 entries, and there were 71 White, 38 Partridge and 34 Buff, a decided increase in the proportion of Partridge Rocks. Rhode Island Reds came next, with a total of 221, Minorcas were next with 203 entries, 190 of which were Black, and Orpingtons and Leghorns were almost a tie (111 and 110) for fourth place. These figures are interesting merely as showing the relative popularity of the different breeds, and it is a question whether they can be depended on even for that, for the meeting of the national Black Minorca Club, held in the city on the same dates as the show doubtless added something to the Minorca interest, yet it was noticeable that practically all the birds exhibited were Southern California birds. There were some wonderfully fine specimens among them. More than one, in passing through Minorca Alley, commented on the unusual size of the birds. "I didn't know they ever grew so big" one man was heard to remark. The utility qualities of the breed were well advertised by one enterprising pullet that had laid her morning egg in her drinking cup, and stood eyeing it with evident pride.

White Leghorns were a small class, though there were some good birds among them. Indeed, if one might judge by the price set upon fourth and fifth cocks and on one cock which won no ribbon at all, they were very good birds indeed. It takes an exceedingly good bird to be worth $100. But, as the expert from Petaluma remarked, fanciers always think too highly of their own birds and should learn to keep their eyes on the defects rather than the good points of the stock they are breeding. That was a wise saying and applicable to other people beside fanciers.

This small size of the White Leghorn class—there were only 29 birds—seems significant. It means, if I read aright, that commercial poultrymen are coming to realize that the commercial and the fancy are two distinct things and cannot be mixed. The fancy sets the standard toward which commercial poultry must struggle, though often far behind, but points and egg production are not often combined in the same bird. More and more exhibitors are coming to acknowledge this and to make the most in their advertisements of whatever utility qualities their birds possess. "Profit in the poultry business is in eggs", read a sign right beside the first prize pen of Anconas. Only

Winner of the Blue

First Buff Orpington hen, owned by W. J. Stewart.

one hen was exhibited, however, solely for her utility qualities. This was Mollie Wellington, an Inglewood bird, a Light Brahma with 325 eggs in a year to her credit. It was a pity more hens with high records were not shown, points or no points.

I talked with a little woman who had brought in a string of the finest Light Brahmas ever shown in Los Angeles. She said she had a hen at home that laid 329 eggs in her pullet year and another that made a record of 282 eggs. "Why didn't you bring that 300-egg hen to the show?" I asked. "Oh, she didn't look nice. She was too little and rough-looking to be shown among these elegant birds.' That is always the way. The big layers are never in show attire. When I asked what chance there was to get eggs from this high producer I was told they were all promised long ago. That is always the case, too. Just let a hen show a real record, and her eggs are snapped up at any price.

The Light Brahma class, which was bigger and better than has ever been seen before in Los Angeles, seemed to me as significant as the smallness of the White Leghorn class. Isn't it true that the heavy breeds are increasing in popularity, not merely as show birds but as real egg producers? I remarked to the Light Brahma lady that I was surprised to hear her report of her hens, for while everyone knows some high records have been made by Light Brahmas, they are generally considered too heavy to be consistent layers. "Oh, no," she replied. "It is only a question of feeding. These heavy hens must be lightly fed. People think because they are big they need a great deal to eat, but that is not true. They are light eaters, and must be fed lightly and made to work." Her birds, she said, had recently been brought from Mexico, where she had line-bred them for 25 years. "We took them up into the mountains in crates, fastened on the backs of mules, and I thought they would certainly die of heat and fright," she said, "When night came I sat down and cried. I couldn't go to look at them. I was sure they were all dead. Presently one of the men came and asked what he should do with the eggs. He said just one Mexican chicken had died. My Brahmas were all right and had been laying in the crates on the way."

Five varieties of Leghorns were entered: White, Brown, Buff, Black and a new breed, the Partridge Leghorn, shown for the first time. This last, like its cousins, the Partridge Rock, Partridge Wyandotte and Partridge Orpington, is a very beautiful bird. The partridge marking seems to be growing in favor, but, while it is both curious and beautiful, would seem rather too difficult of attainment to be of much practical value. Brown Leghorns were out in greater number than usual. It would be well if this breed, so much liked in the East, were more extensively bred on the coast.

Rhode Island Reds have the advantage of being a breed with but one color, though there are two styles of comb. The Reds, single comb and rose comb, nearly equalled in number the four varieties of Rocks. There are probably more Reds kept in Southern California today than of any other single breed except the Leghorn. And Red fanciers are making a point of the utility qualities of the birds. For instance, one of the handsomest birds in the show, the Rose comb blue ribbon cock, Red Arrow, had placarded on his coop, the egg records—not complete but sufficient to show their quality—of his pen mates, two of whom bore the euphonious names of "Lay More" and "Lay Many."

There were some very fine White Wyandottes. In fact, the best pen in the show, though it received no special award, was probably a pen of White Wyandottes. There were some choice Buff Orpingtons. Sometimes the Whites and Blacks have overshadowed the Buffs, but this time the Buff were far ahead, a thoroughly good class, though not large. There were Games, of course, and Anconas and Andalusians and White-faced Black Spanish, and the usual number of rare and curious breeds, but why try to enumerate them all? There were more varieties of Bantams than usual, but the Buff Cochins were absent. I missed them, and the Silkies and Frizzles, and other freaks which used to be regular entries. This seemed to be a show without a freak. There were 34 turkeys, but none of them remarkable for size or color, six kinds of ducks, of which the beautiful Rouen attracted most attention, and the catalogue mentioned a pair of geese, but they must have been hidden in a corner somewhere or else had gone home before I got there, for I could not find them.

A visit to a big poultry show is not worth very much unless one can sit down afterward and crystallize an impression of it. If the impression is vague and blurry, just shadowy figures of birds, with here and there a name, you haven't brought away much. My impression of this show is a composite photograph in which the American breeds, more especially the Rocks and Reds and of the Mediterraneans, the Minorcas, stand out clearly against a shadowy background of other breeds. Where are the Anconas, which a few years ago were heralded as the "coming breed"? Where are the Buttercups, advertised as the best layers on earth, the Houdans, the Campines, and all the rest? They have had their day, their little run of popularity, and are just a background now for the grand old tried and trusted dual-purpose American breeds, and the Minorcas, which may or may not have come into their own. Maybe they too will "have their day and cease to be", but they are standing the test of time, and they have qualities differing from those of the American breeds on the one hand and the Leghorns on the other, which seem to entitle them to a permanent place in our regard. It may be, too, that the Light Brahmas, which have always been highly thought of by Eastern fanciers, will make a place for themselves here in the West. They make the best of roasters, and when they are bred as well for egg production the combination is hard to beat. And this brings us back again to the point where we started, the utility test. It is the birds that have stood the utility test that made this show, the birds that produce eggs and meat, no matter how fine their feathers, and these are the birds that make business for the fancier as well as for the farmer and the commercial poultryman. Fancy and utility go hand in hand. They cannot be separated for long. When you talk to a practical man about feathers, he asks about eggs. When you discuss combs and earlobes he wants to know how early broilers are ready for market. And so it goes. The fancier must "show cause", must make quite plain the relation between type and egg production. He sets the standard for the hen's outside. The utility breeder

A Champion

looks after her inside. United they stand; divided they fall.

Judges of the different classes were: E. E. Emerson, Barred and White Rocks, Wyandottes and Rhode Island Reds; A. G. Goodacre, Buff and Partridge Rocks, Leghorns, Sussex, Andalusians, Black Orpingtons, Hamburgs, Buttercups, Ducks and Geese; Will Purdy, Orpingtons (except Black), Cornish Games, Spanish, Campines, Asiatics, Turkeys, Bantams, Guineas; Geo. W. Masterson, Minorcas and Anconas. C. S. Gibson judged the rabbits and pigeons.

The Pride of Petaluma Fresh Air Brooder Stove

Well, here we are again, and our No. 20 catalogue is now ready for you. It's a HUMDINGER, and if you are interested in poultry you should have it. It's full of splendid information about brooding in bunches from 300 chicks on up with the brooder stove system. If you are satisfied with your present brooding system, get our catalogue and learn how you can BEAT IT. If not satisfied, GET OUR CATALOGUE No. 20, it will put you RIGHT. We also have a splendid HOT WATER SYSTEM, but we can't tell it here, so

Get our CATALOGUE No. 20. IT'S FREE FOR ASKING.

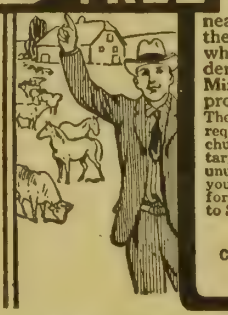
160 ACRE FARMS IN WESTERN CANADA FREE



Canada's Liberal Offer of Wheat Land to Settlers

is open to you—to every farmer or farmer's son who is anxious to establish for himself a happy home and prosperity. Canada's hearty invitation this year is more attractive than ever. Wheat is much higher but her fertile farm land just as cheap, and in the provinces of Manitoba, Saskatchewan and Alberta

160 Acre Homesteads Are Actually Free to Settlers and Other Land Sold at from $15 to $20 Per Acre

The great demand for Canadian Wheat will keep up the price. Where a farmer can get near $2 for wheat and raise 20 to 45 bushels to the acre he **is bound to make money**—that's what you can expect in Western Canada. Wonderful yields also of **Oats, Barley and Flax. Mixed Farming** in Western Canada is fully as profitable an industry as grain raising.

The excellent grasses, full of nutrition, are the only food required either for beef or dairy purposes. Good schools, churches, markets convenient, climate excellent. Military service is not compulsory in Canada but there is an unusual demand for farm labor to replace the many young men who have volunteered for the war. Paint Without Oil

Remarkable Discovery That Cuts Down the Cost of Paint Seventy-Five Per Cent

A Free Trial Package is Mailed to Everyone Who Writes

A. L. Rice, a prominent manufacturer of Adams, N. Y., has discovered a process of making a new kind of paint without the use of oil. He calls it Powdrpaint. It comes in the form of a dry powder and all that is required is cold water to make a paint weather proof, fire proof, sanitary and durable for outside or inside painting. It is the cement principle applied to paint. It adheres to any surface, wood, stone or brick, spreads and looks like oil paint and costs about one-fourth as much.

Write to Mr. A. L. Rice, Manufacturer, 129 North Street, Adams, N. Y., and he will send you a free trial package, also color card and full information showing you how you can save a good many dollars. Write today.

The Poultry Producers of Southern California

Written for California Cultivator By Cornele G. Ross

THE Poultry Producers of Southern California, Inc., the organization of which body was completed on December 28, 1916, is the result of several years' work on the part of many earnest poultrymen together with the added labors of State Market Director Harris Weinstock for the past six months.

The new organization takes the place of the smaller Federation of Poultrymen of Southern California, which was organized in the fall of 1914 and has since then been marketing the eggs of its members.

The work of this federation resulted in a very considerable improvement in marketing conditions, but the progressive members of that body felt that there was room for improvement and that a larger organization with a broader scope would better meet the needs of the industry, and in May of last year they met with the state market commissioner and discussed ways and means of forming such a body.

This meeting resulted in others of a similar nature, and finally a campaign was launched to see if subscribers could be secured for a corporation to represent not less than 400,000 hens, under an agreement modeled on the lines of one that had been worked out, with the aid of the state market director, for a similar organization in the north and that seemed to the poultrymen of this part of the state to meet all the conditions in a satisfactory manner.

A committee was appointed and the work was pushed with such vigor that by the early part of December sufficient subscribers were secured to warrant going ahead, and a mass meeting was called at the Times Auditorium in Los Angeles, at which meeting a temporary board of directors was elected and articles of incorporation were immediately filed.

A second meeting was called for December 28, 1916, at which time the organization was perfected and a permanent board of directors elected, by-laws adopted and arrangements entered into for the marketing of the eggs of the stockholders for the first year.

The board of directors elected was as follows; for San Diego County, Thos. Hurley; for Orange County, W. L. Grubb; for Riverside County, J. M. Davison; for San Bernardino County, Wm. Brandt; for Los Angeles County, M. A. Schofield, B. R. Holloway, Cornele G. Ross, Elliott Brett and W. L. Prewitt.

The tenth director was nominated by State Market Director Harris Weinstock, who named Mr. Austin O. Martin of the First National Bank of Los Angeles. The officers of the corporation are J. M. Davison, of Riverside, president; Cornele G. Ross of Pomona, vice president, and Frank B. Smith of San Gabriel, secretary and treasurer.

The active management of the affairs of the corporation will be in the hands of an executive board of three, of which M. A. Schofield of Gardena is chairman, with G. W. Belden of Monrovia and Austin O. Martin of Los Angeles as the other two members.

A receiving depot has been established in Los Angeles, where all eggs will be received, graded and packed, and from which they will be distributed as needed.

A new and higher grading has already been secured and "California Fresh Extras", which are to be quoted daily on the Los Angeles Produce Exchange, represent a product which is not excelled in any market, so that the consumer as well as the producer should be the gainer by this move. The main object of the movement is to bring about closer cooperation among poultry producers; to provide for the marketing of their products at the lowest possible cost under uniform methods, and in a manner to secure to each producer a certain market and at the full average price to be obtained for the entire season.

The purchase of feed and supplies for its members will undoubtedly be a feature that can be made of inestimable benefit and should result in reducing the cost of feeding to a minimum.

Then, too, under cooperative action much can be done by a systematic campaign to educate the consumer to the fact that without cold storage the poultry industry would be an impossibility and that a good storage egg may be, and often is, better than many so-called "Fresh Eggs" which have been improperly handled in getting them from the producer to the consumer. Eventually, no doubt, "Producer Storage Eggs" can be placed in the hands of the consumer under a guarantee of satisfaction in every respect and at a price that will obviate the necessity of eliminating the egg from the bill of fare for several months in the year as is now the rule.

The new corporation has been formed on broad and comprehensive lines and every possible safeguard placed to protect the individual stockholder, and it is hoped that all poultry producers who are not now members will recognize that they too owe their support to the movement and will come in without delay.

The members themselves should all be loyal to their own interests and do all in their power to enlarge and strengthen the corporation, especially by acting as missionaries to their neighbors and friends who are not members, and inducing them to join.

The Central California Poultry Association

Written for California Cultivator By C. S. Wilkins

THE Central California Poultry Association, formerly known as the Poultry Producers of Central California Inc., the new organization of poultrymen effected under the direction of the state market director, soon will begin handling the product of its members, according to report given out recently by one of the directors.

The organization is divided into several districts and represented in each by a director or directors. Some comment has been made that the Northern association has not progressed as rapidly as the Southern division, but it must be remembered the central body had first to sign up 1,000,000 hens before operations could start and the latter body but 400,000, easily secured in a comparatively small area.

Sonoma district is represented by five directors; Chas. Romwall, N. M. Jensen, Wm. Evart, P. R. Lyding and A. Sychrowsky; Sacramento Valley, L. W. Eskridge; San Joaquin Valley, James D. Yates; Santa Cruz, Dr. Chas. K. Hale; Alameda, John H. Barber; Santa Clara-San Mateo, Chas. Weeks; the State of California, Edgar Allen Forbes.

Mr. Romwall has been elected president of the association, J. H. Barber, first vice president; A. Sychrowsky, second vice president; E. A. Forbes, secretary-treasurer, and the Anglo-London-Paris National Bank of San Francisco, depositary. The executive committee is composed of Chas. Romwall, E. A. Forbes, J. H. Barber, Chas. Weeks and A. Sychrowsky.

Just how soon the association will attempt to handle the product of its members is not certain, although, says L. W. Eskridge, director of the Sacramento Valley district, it probably will be in the near future. A number of meetings have been held at which marketing problems have been discussed and it is thought probable a satisfactory arrangement will be made within the next few weeks to start operating.

Nothing could be learned of the different plans which have been put to the directors for handling the product.

The largest buyers on the coast have been approached, and it is said the most friendly feeling exists between them and the representatives of the association.

While the work of the association is still in the early stages of development yet the directors and members feel a great good will be accomplished. It is the best opportunity to benefit the poultryman, if the work is carried on properly, that has been presented during the past 20 years, says Eskridge.

POULTRY FOR PROFIT

There are but few people following the poultry business because of the pleasure derived from handling something beautiful in form or feather or in breeding to improve simply for the pleasure of making a more beautiful strain. Where there is one of this type of breeder there are thousands who are in the industry primarily for profit. Most of the fanciers' clubs are looking to the utility side as well as to form and feather. Egg laying contests, like cow testing associations, are increasing in number, in popularity and in the practical nature of the lessons which they are teaching. No question comes to the Cultivator oftener than, how much is there in the poultry, or the swine or some other industry? There is no question more impossible to give definite answer. As well might one ask, how much of a success will be a physician, a banker, or one following any other trade or profession? It is a question of personal ability and with that goes plenty of hard work, attention to details, shrewd business management, and so many other factors that only the one asking the question can answer it.

Shed Roof Colony Houses on Monrovia Poultry Ranch
Illustration from Poultry for Profit, by Mrs. Koethen.

The first requirement in the poultry trade, as well as in any other, is to learn the business. Practical experience is the only way in which it can be learned, but one of the best aids in securing a knowledge of the business is the agricultural or other paper which gives practical suggestions and methods, and for everready reference, one of the many books which treat of the poultry industry. We believe we may be justified in referring in this connection first to "Poultry for Profit" by a practical poultry woman whose experience has been secured in practical poultry work in California. Mrs. Jean A Koethen has written a practical manual for beginners, farmers and side line poultrymen, which has been published by the Cultivator Publishing Co., and it has so much that is of value to the California poultryman, especially to the beginner, that it should be in every farm home.

In the opening sentences of the book Mrs. Koethen is rather over modest, for she disclaims any idea of making the book a treatise or one which a thoroughly informed and experienced poultryman will need. She says:

"Poultry keepers, present and prospective, may be divided into five classes:

1. The man who makes poultry production a business.
2. The man (it is more often a woman) who keeps chickens in the back yard to supply the family table.
3. The farmer who keeps poultry as a necessary and profitable adjunct to the more important farm operations.
4. The back lotter or suburbanite who raises fowls as a side line to add to the family income.
5. The person (man or woman) who is interested in good poultry and who looks forward to some time becoming a producer.

If you belong to the first class, this book is not for you. If you belong to any of the other four, and especially to the last class, you may find in it something that will give you a clearer idea of the much misrepresented 'chicken business' and of the principles which underlie successful poultry production."

Now then, for the other books in the library. We may refer to one of Lippincott's farm manuals, "Productive Poultry Husbandry". This is written by Harry R. Lewis, and, is, we believe, recommended by the agricultural college of our state university as a textbook. Then there is Robinson's "Principles and Practice of Poultry Culture" published by Ginn & Co. and a more recent publication, in fact just received from the publishers, the Orange-Judd Co., "Poultry Breeding and Management" by James Dryden, professor of poultry husbandry of the Oregon agricultural college. Any of these books may be seen in the library of the California Cultivator.

MORE MONEY IN EGGS THAN POULTRY

Eggs for market should be the most important source of income from the farm flock. There is a steadily increasing demand for fresh eggs of good quality at profitable prices. In addition eggs are produced with less labor than other poultry products and are more conveniently marketed.

Poultry for market should be the second source of income. Under present conditions, the larger part of the poultry meat produced on most Ohio farms is a by-product produced and sold with little regard to the cost of production. The poultryman should plan his work so that while producing eggs for market, he may obtain considerable revenue from the sale of broilers during June and July, fowls during September and October and capons from January to April.

An institute of farmers and vegetable growers will be held at Riverside January 19-20.

Gains in Dried Fruit Industry

CALIFORNIA'S dried fruit industry made remarkable gains during the year 1915, according to the report of George Robertson, statistician of the State Agricultural Society.

He points out in his report that the total value of all imported fruits in 1913 in this country, including dates, bananas and Greek currants, was $32,100,392; in 1914, $32,235,011, and in 1915, $23,046,778. The largest falling off in imported fruits was in figs, which decreased from 20,506,000 pounds in 1914 to 8,327,000 in 1915. Olives also dropped considerably, from 5,743,000 gallons in 1914 to 3,713,000 in 1915, indicating that both the fig and olive crops of the state are fast becoming large enough to supply the national demands without buying abroad.

The exports of domestic dried friuts have been increased in value from $28,868,000 in 1914 to $36,924,000 in 1915, indicating the fast strides which the horticultural interests of the state are making.

Importations of raisins, which some years ago amounted to 40,000,000 pounds, were reduced in 1915 to 1,604,000 pounds, the lowest on record. The records show that imports of raisins have steadily decreased, while exports have increased.

"Some of the most notable changes," said Robertson's report, "are in dried apricots, from 16,541,000 pounds in 1914 to 25,747,000 pounds in 1915, the bulk of which went to the United Kingdom. The exports of oranges decreased from 1,839,000 boxes in 1914 to 1,588,000 boxes in 1915, nearly all of which in both years went to Canada. Dried peaches increased from 7,387,000 pounds in 1914 to no less than 18,720,000 pounds in 1915.

"Exports of California prunes also show a large increase, from 35,228,000 pounds in 1914 to 50,775,000 pounds in 1915. Of these 15,677,000 pounds went to the United Kingdom, 10,941,000 to Canada, and 18,572,000 pounds to other European countries.

"Exports of California raisins made a remarkable showing, having advanced from 16,594,000 pounds for the calendar year of 1913 to 21,688,000 pounds in 1914, and to no less than 58,497,000 pounds during the past 12 months. These latter figures seem to prove the value of a well-organized industry to growers, as shown by the results achieved by the California Associated Raisin Company.

New Thornless Blackberry

Written for California Cultivator by George T. McCabe, Secretary Stanislaus Board of Trade

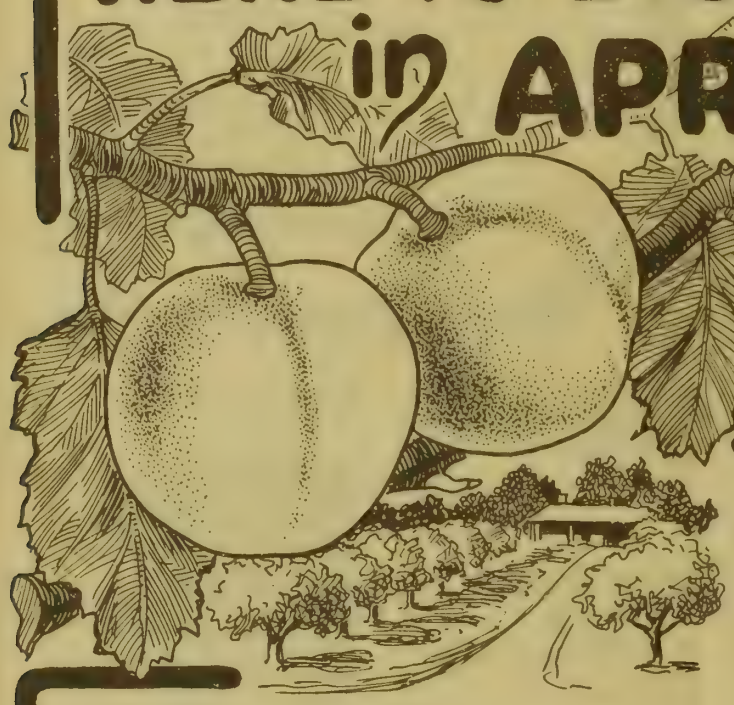
THAT discoveries are being made along agricultural as well as scientific lines is evidenced by the new thornless mammoth blackberries that have been perfected and developed by Mr. W. C. Cory, a young man living in Tuolumne County. This discovery was made by one Martin Meuli on a small ranch in what is known as the "Mountain Pass," Tuolumne County, in 1909. Mr. Meuli, after making the discovery, paid little or no attention to the further development of this variety of blackberry. Mr. Cory, a neighbor, appreciating the value of this discovery, took slips from this vine and experimented for several years, until he has perfected this new variety.

The fruit that is grown on this new vine is of the mammoth variety, without seeds, and has a flavor that will compare with, if not superior to, the ordinary berry. While it is a prolific bearer, one of its most essential features is its early maturity, being the first to ripen. One-year-old plants set out in February will bear ripe fruit the first of June. It is a hardy and thriving plant, can be grown in almost any soil, sandy loam being the best. Its yield is commensurate with the amount of cultivation, irrigation and fertilizer used.

One acre, which is in bearing on Mr. Corby's place, produced 700 crates and about one-half of the crates were used in tipping for new plants. In this truly remarkable plant much nourishment is diverted from the growing of thorns to improving the size, quality and quantity.

In visiting Mr. Cory's place we found that the vines were trellised, in some instances the vine growing to a length of 24 feet, and along on the wire of the trellis, leaving the space underneath sufficient so that the fruit could be gathered readily and without the necessity of wearing gloves to prevent the hands being pricked by thorns, for be it remembered that these are thornless vines. As a commercial product these thornless blackberries have unsurpassed features in having firm meat, an essential quality in shipping to market. The cost of picking the fruit is cut in half owing to the absence of thorns, also the cost of pruning and taking out the old cane and trellising up the new wood is more than cut in half. It is the berry de luxe for the table, and its seedless quality permits the making of jams, preserves and jellies that are almost transparent.

THERE IS BIG MONEY in APRICOTS!



WHY?

BECAUSE either in the green or dried state, they are always in demand.

BECAUSE the market yearly consumes the entire output of both canned and dried apricots.

BECAUSE they grow rapidly and early bear a heavy crop.

BECAUSE THERE IS BIG MONEY IN APRICOTS.

Three Big Leaders,--

Royal, Blenheim and Tilton

We have them on either Peach or Apricot Root.

NIGHTSHADE AS AN ORCHARD PEST

Written for California Cultivator By E. L. Koethen

The writer sometimes wonders whether most of our citrus growers realize what a real menace the nightshade is as a weed in our orchards. I refer to Solanum nigra, the black berried weed so common in fence rows and under trees. If the reader will take the trouble to pull one up so as to get the roots, he will likely find the roots and collar of the plant infested with a perfect crop of black scale and brown scale. This is sure to be the case if the orchard is affected. Herein lies the danger. We spend much money to make a clean sweep of the scale on the trees, and here at their feet is a plant that holds enough live scale, protected by the soil, to infest the entire orchard again. Then we are liable to blame the fumigator for making a poor job. I should think the fumigators themselves would refuse to fumigate an orchard that was infested with this weed, as it is impossible for them to give satisfaction with this menace left in the orchard. Kindly go out into the orchard and pull up the first plant you find and verify this warning.

APPLES STALL RAILROADS

The Wenatchee apple district of the north central part of the state of Washington produced almost 8000 cars of apples during the 1916 season, says the Spokane Chronicle. So rapidly is the annual crop increasing by new orchards coming into bearing that growers face serious labor, storage and transportation problems.

In 1918 the crop will amount to 10,000 cars. This entire tonnage must be moved during a 60-day period, most of it going to the Middle West and Eastern markets. This will mean that

the railroads will have to provide 400 cars daily for transportation service, which is vastly more than the present facilities. During the 1916 shipping season more than 2000 cars were delayed and subject to frosts because of the car shortage.

CITRUS CANKER

No final statement as to the outcome of the campaign against citrus canker can be expected within a period of at least two years, according to report of Secretary of Agriculture. The campaign, however, is progressing very satisfactorily in the commercially important orange and grapefruit regions of Florida. Even in the few places where citrus canker outbreaks have occurred in commercial districts and in old trees the disease can be eradicated promptly and effectively. Although thorough inspection of citrus plantings will be necessary, at least throughout the coming fiscal year, it is believed that Florida now is so nearly free of the disease as to render its eradication from that state practically certain. In Texas, Louisiana, Alabama and Mississippi the work has been more difficult from the beginning because of the more scattered plantings and the relatively smaller interests involved. Furthermore, in all these states the unusually severe tropical storms of the present year have caused unexpectedly wide distribution of the disease in some areas. Even in these states, however, the progress of the work is encouraging, and if no further unusual drawbacks are encountered the disease will be effectually checked.

DIVERSIFY

For some years the Riverside producers have been discussing the advisability of broadening out along productive lines. Riverside is known the world over as a great citrus center but there are some sections of Riverside so well adapted to other crops that it has formerly been urged by producers, and now through a campaign taken up by the chamber of commerce, that these lands be given opportunity to produce up to their best. The Riverside Press gives the program for an institute of gardeners and truck farmers. There will be addresses by Prof. Rogers of the university on cultural methods for root crops, by Dr. Webber on potato seed selection, by Dr. Batchelor on bush fruits and berries, by Frank Patton on potato growing, and by Mr. Robinson on tea growing. Prof. Vaile, A. C. Lovekin, W. H. Fertig and J. A. Packard form the committee on arrangements.

The institute convenes in Pilgrim Hall of the First Congregational Church on Friday and Saturday, January 19 and 20. There will be both forenoon and afternoon sessions.

CHEMICALS AND ORCHARD PESTS

On Page 649 in our issue of December 30 Mr. C. W. Hill gave information regarding the chemistry of spraying. In referring to the uniformity of chemicals or, rather, to the necessity for knowledge of various strengths of chemicals used, Mr. Hill said:

"Sodium hydrate comes into commerce in the following strengths: 60 per cent, 70 per cent, 74 per cent, 76 per cent Na2O. Phenol (carbolic acid) crude comes to commerce in strengths as follows: three per cent, ten per cent, 15 per cent, 25 per cent, 35 per cent."

When proof came to the reader a slight error was made in the fourth line. In making correction of that an assistant left out entirely the line above, the third, so that the paragraph was left without any meaning. We hope that sprayers will note this correction.

DRAINING IN FRESNO COUNTY

The experiment station of the college of agriculture is issuing a preliminary report of the Kearney Vineyard experimental drain of Fresno County, made by Walter W. Weir, drainage engineer, U. S. D. A., based on work done under a cooperative agreement between the office of public roads and rural engineering, U. S. D. A., and the University of California agricultural experiment station.

For those having lands which have been injured by seepage from irrigation canals, and there are many such lands in Central California, this preliminary report will be invaluable. Bulletin 273 may be had by writing Agricultural Experiment Station, Berkeley.

Roeding's Page on Trees

PLUMS AND PRUNES

WE are going to consider them together for they are really one and the same except that a prune is defined separately because of its great sugar content and its adaptability for this reason for drying. Very few plums can be successfully dried, but there are several varieties of prunes which may be used for both shipping fresh as well as for drying.

Just recently I heard a man who was very prominently connected with the fruit business say: "Don't plant plums; too many already. Can't sell them." Maybe so, but probably next year the prices will be exceptionally high and then everybody will want to plant plums no matter what the soil conditions may be. Nurserymen will be driven to distraction. Their inability to meet the demand will cause the grower to gnash his teeth. Then he wants to know "what the devil is the matter."

ALWAYS IN DEMAND

Now my good friends, just bear this one point in mind. If YOU know you have the right location for plums, plant them. You will make no mistake. There has been a big demand for canning varieties this year, particularly such sorts as Jefferson, Washington, Yellow Egg and Bavay's Green Gage. And then you have the great shipping plums; Beauty, Climax, Clyman, Diamond, Formosa, Gaviota, Grand Duke, Kelsey and Wickson. As a matter of fact, several varieties of the family termed prunes are really plums. The Hungarian, Silver, Tragedy, all stand in this class, good for shipping but valueless for drying. Comparatively few growers realize that in addition to the French Prune the Imperial Epineuse, Robe de Sargent and Sugar, have exceptionally great values on account of their size and high sugar content, consequently they are equally as valuable for shipping as for drying.

MAKE SURE YOU ARE RIGHT

It is hard to account for all the anomalies in the fruit business. In the interior valleys, the warm weather in the summer months causes apricots to be dried and out of the way before they even commence picking in the Coast counties. The French Prune however matures its fruit much later in the interior valleys than it does in the Coast counties. No accounting for this, but it is true just the same. The Robes, Imperials and particularly the Sugar are very much earlier in the interior in ripening their fruits than the French. Bear in mind that it pays to get your tree fruit out of the way before the height of the raisin drying season begins, for then the pickers are hard to get.

LET US HELP YOU DECIDE

Read carefully what we say in our new catalog about the Improved French Prune. It has merits which have been demonstrated after years of careful observation. The Standard and Conquest, recently introduced, are meritorious fruits but we would advise going slow on them until their value has been more clearly defined. We will be glad to advise with you fully about your requirements.

True Trees
--True to Name
--True to Quality
--True to the Reputation of Character and Reliability Built up by 33 years of Fair Dealing

NO matter what you may have in mind to plant this season it will pay you to consult Roeding. Regardless of whether you buy from us, we are always glad to consult with prospective planters. Of course, we have a good stock of citrus and deciduous fruits in nearly all varieties—and the name "Roeding" indicates the quality.

Ask Us About the FRENCH PRUNE IMPROVED

If you contemplate setting out prunes don't specify varieties until you learn more about this new wonder. Being larger than the French Prune, it fills the picking boxes quickly, costs less per pound to pick, brings better price per pound, bears every year without fail, has all the good qualities of the French Prune—and more.

Ornament Your Home Grounds with Roeding's Evergreens, Palms and Roses

A few vines, shrubs and plants around the home place make a wonderful difference in its appearance—and incidentally in its value. Our Landscape Department will help you lay out the grounds—not necessarily on an elaborate scale, but in accordance with your ideas. Write us.

Now Ready:---

--our big new illustrated catalog

We have just received from the printer our 1917 catalogue, which is the most complete one we have ever issued. It is attractively illustrated; lists and prices over 2000 varieties of fruit and ornamental trees, vines, shrubs and plants. If you haven't already sent for a copy, it will pay you to send us your name and address now. A postcard will do.

Questions and Answers

ANSWERS BY EDITOR AND STAFF

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Raising Geese

How many eggs does a goose lay? Does she brood after laying? I put five under a hen but had no success after 32 days. May be they were not fertile as they were the first ones. I was surprised as I have a good gander with two geese. I have 20 more eggs. What should I do with them, all from one goose; the other one is starting to lay too? Is it advisable to have them brooded by hens, and how many eggs can she cover? Must the goose have earth in her nest?—Subscriber, Redondo.

A goose will usually lay from 40 to 80 eggs in a season. They are in three clutches, after each one of which she goes broody, but is very easily broken up by being removed from the nest. The first two clutches of eggs are set under hens so that the goose will lay as long as possible, but she is allowed to incubate the third clutch. A hen can cover four or five goose eggs, according to the size of the eggs and the size of the hen. They should hatch in 30 days if they are fertile. Possibly your geese are yearlings. If they are you will find a great many eggs infertile. Geese are not mature until they are two years old, and it is hardly worth while trying to hatch from them earlier. It is rather early in the season for hatching. Possibly this is another reason for the failure of the first lot to hatch, and again it may be that there was a gosling in the egg all ready to hatch, but it could not break the shell. Goose eggs have very firm shells and it is often necessary to help the goslings out. The eggs should be sprinkled with warm water daily during the last week of incubation. You had better put what eggs you have under good big hens unless the geese are young, in which case it might be better to wait a month. Sprinkle the eggs, and if they do not pip by the 30th day break the shell and see what is inside. This must be done at the large end of the egg, and very carefully. You will also have to watch the hen very carefully while the goslings are hatching, for some hens don't like the looks of goslings. They will brood them nicely if they do not kill them on sight. I don't think the goose particularly needs earth in her nest. Let her sit where she has been accustomed to lay. She will fix up the nest to suit herself and will moisten the eggs properly if she has access to water deep enough to swim in.—J. A. K.

Epsom Salts for Hens

How much epsom salts should be given to 100 hens and how often?—Subscriber, Pasadena.

How much and how often depends entirely on what ails the hens. A recent University of California bulletin on the treatment of intestinal worms gives eleven ounces as the dose for 100 hens after the tobacco treatment has been given. Dr. Salmon speaks of 50 or 60 grains as a "full dose" for a single fowl in case of severe intestinal disorders like limberneck, and of 30 to 40 grains as the proper dose in milder ailments. I think the university's dose of eleven ounces to 100 hens might be taken as the limit for ordinary use, and if the question refers to occasional use as a preventive of disease, from eight to ten ounces per 100 birds should be sufficient. When the drug is given in this way it is mixed in moist mash once or twice a month.—J. A. K.

Odd Shaped Eggs

What causes hens to lay odd shaped eggs? Our Reds last year laid good hatchable eggs, but this year most eggs are unfit for hatching. Conditions were the same both years. Fed some corn since weather got cold, but went back to wheat for fear they were too fat. They have run of orchard and barn yard. Is there a chance eggs will get better shaped again?—V. D., Campbell.

Your hens must be a little too fat. If you will feed less grain and more of the laying mash and see that all grain is either buried in deep litter or scattered through the orchard so that they have to work to get it I think you will find the eggs returning to their normal shape. It is just possible that the age of the hens has something to do with their overfat condition and the resulting badly-shaped eggs. Old hens of the heavy breeds incline to fat and are very hard to reduce.—J. A. K.

Branding Horse

Is there any way of bringing out a dim brand on horse which now can hardly be seen or should the hair simply be sheared off?—Subscriber, Red Bluff.

We should think the best method would be the clipping or else re-branding so as to make the brand stand out plainer.

Fertilizer for Grapes

Would you recommend application of commercial fertilizer to Thompson Seedless grapes? If so, how, when, and in what quantity?—Subscriber.

The discussion of fertilization is too long a one to take up in this department. The analysis accompanying the inquiry shows the fertilizer to be a good one, but no matter how good the fertilizer may be there are many other questions involved in securing a better crop of grapes. Physical condition of soil is the first essential. The soil may be extremely rich in all the elements necessary to produce a crop but its lack of humus or of vegetable material which lightens and gives life to the soil may prevent utilization of these elements. Knowledge of the elements required to produce a certain fruit and knowledge of the chemical constituents of the fertilizer is of value but it must be considered in connection with present soil conditions. If there is sufficient vegetable mold in the soil this fertilizer would give good results. If not then green manuring or, better and quicker, the application of stable manure would give results far superior to any chemical fertilizer. The same inquirer wishes to know as to the application of gypsum to Thompson Seedless vines, as to whether it would do any good, and proper quantity to apply. The answer to this is

Don't Pay Taxes on Unproductive Land

EVERY cent that you pay in taxes on unproductive land is money wasted. You can eliminate this waste—not by getting rid of the taxes but by getting rid of the land—the *unproductive* part of it.

Take it out of the unproductive class—make it *pro*ductive by means of

HERCULES DYNAMITE

If you own land rendered useless by water, stumps, rocks, or by all three combined, Hercules Dynamite will clear it at the least possible expense.

If you have ever run a drainage ditch, pulled stumps, or removed rocks by hand power you know the amount of work involved. Hercules Dynamite will do the same job, and do it more thoroughly, at a small fraction of the cost in time, labor and money.

It will pay you to write us for an instructive and interesting book called "Progressive Cultivation". It is sent free on request. It treats fully not only the question of land clearing by means of dynamite but also subsoiling, tree planting, irrigation work, etc. Write for your copy today. Please use the coupon opposite.

practically the same as above, "What is the present condition of your soil?" Also bear in mind that gypsum is in no sense a fertilizer, but aids in making available the potash now in the soil and also where there is black alkali it aids in neutralizing or rather in changing this to white alkali, which is more easily removed from the soil.

Name for Ranch

I wish to name my ranch. How can I get a list of names already used, also how does one proceed to secure exclusive use of the name chosen?—Subscriber, Chino.

A long list of names chosen by various farms of California was given in the Cultivator of September 1, 1910 and May 9, 1912. The practice is quite popular and we believe should be made more so. As to securing a list of names which have been trademarked in California one should write the secretary of state for list and for blank application. This is to be returned to the secretary with a five dollar fee and the trade mark is granted if it is not a duplicate and then becomes exclusively the property of the one securing the right and may be used on products of the ranch.

Grape Pomace for Fertilizer

What value, if any, has grape pomace as a fertilizer for orange trees when dried and ground? Can you advise regarding results of the use of this material?—Subscriber, Lindsay.

Grape pomace is valuable but we have seen it applied to gardens where it was taken almost direct from the winery and the gases arising from the pomace practically killed the crops. Where it is "weathered" by being thrown in a shallow compost pile for some weeks or months it seems to be entirely safe. We are not able to give its analysis or its plant food value but know it is a valuable humus maker. It is probable that in orchards where the pomace is not too close to the trees there would be no danger in using at once.

One of the Potato Family

I enclose leaf covered with long orange-colored brittle spines. What plant is this from?—Subscriber, Saticoy.

This is Solanum pyracanthum, one of the potato and nightshade families. Some near relatives have been introduced into California but are not troublesome weeds.

Yellowing of Trees

What causes the foliage of Valencia trees to grow yellow? This condition has been growing steadily worse in my orchard since September. It was given a top dressing of straw in August and since then manure. Will this condition affect the yield?—Subscriber, Terra Bella.

As to what causes yellowing of trees, it may not be absolutely accurate to say there are something over a thousand different causes, but from the number of reasons given in discussions of this question which come up at citrus institutes that answer is the nearest to correct of any we can give. Our first step with yellow trees would be to look to the soil. We would lighten it up with strawy fertilizers, would get the air into the soil through cultivation or spading, working well around the trees, we would investigate as to hard pan, we would look to the condition of the trunk of the tree, that is, as to whether there might be gum disease, and finally perhaps prune out a part of the top. These suggestions are only a start toward an answer but may suggest an investigation which should be started at once.

Beet Nematodes

Am sending specimens of beets diseased and covered with small warts. What is the cause and remedy?—Subscriber, Orange.

The cause of this trouble is the beet nematode, a species of eelworm. As to control, there is practically none other than rotation of crops. A complete discussion of this pest with illustrations and general suggestions is "Control of the Sugar Beet Nematode", Farmers Bulletin 772 of the United States Department of Agriculture, which may be secured by writing the department at Washington.

Poultry in Kings County

Written for California Cultivator
By Grahame R. Saunders

KINGS County, although one of the smallest counties in the state and the county in which the purely commercial egg ranches can be numbered on one hand, produces upwards of a quarter of a million dolars' worth of eggs annually, while its shipments of live poultry, geese and turkeys total even more than that sum. In Kings County poultry has proved to be very profitable, and hundreds of peach, prune, apricot and other fruit growers are finding it profitable to run hens in their orchard, making them serve the double purpose of fertilizing the ground and producing eggs.

Nearly all of the eggs and poultry produced in Kings County are shipped to the markets in Los Angeles or San Francisco, the former generally paying the better prices for eggs, though live poultry and turkeys are generally sent to San Francisco. Despite the distance from both places moderate express rates enable the ranchers to ship without much loss. Eggs reach the markets at two cents per dozen for expressage, which includes the return of the case. This enables the ranchers to get the best prices possible for their eggs as they then have the choice of markets, north and south as well as local. Nearby towns such as Fresno and Bakersfield absorb a surprisingly large number of eggs as well.

The mild winter here with the light sandy soil makes the county particularly well adapted to poultry. Green feed grows all the winter without any trouble, while it goes without saying that in the summer, with all the irrigation there is, and the huge acreage of alfalfa that the county boasts, the question of green feed does not arise at any season of the year, while the light soil makes the very finest ground for hens to roam about on.

The largest ranch in the county today is that of W. C. MacFarlane, the pioneer commercial egg rancher of this county. For the past ten years MacFarlane has been out of the commercial egg business for six months of every year, selling his eggs for hatching purposes and making the county famous for being the home of the MacFarlane strain of heavy laying Leghorns. His ranch, which is known as the Richland Egg Ranch, is an irrigated peach orchard in which the hens, some 4000 in number, thrive. MacFarlane ships eggs all over the world.

M. A. Hemminger of Grangeville also has a big ranch devoted entirely to White Leghorns which keeps him busy shipping eggs all the time, while B. Hawley who has a 20-acre ranch northeast of Hanford is another extensive utility poultryman. In the Corcoran district large numbers of eggs are produced though Corcoran is becoming famous for its turkeys rather than its hens.

Turkey raising has become quite an industry around Corcoran and on the west side, where huge herds of turkeys are raised every year for the Thanksgiving and Christmas markets. It is estimated that more than 10,000 turkeys left Corcoran depot for the Los Angeles and San Francisco markets this fall, and this does not take into account turkeys raised in that district that were delivered at other points. One buyer alone bought and shipped 6000 head of turkeys at Corcoran.

Among the fanciers in Kings County William F. Heusel is one of the longest established. Heusel has a predilection for Wyandottes, particularly the Silver Laced variety. This type he has been breeding for 20 years and is one of the best known exhibitors in this part of the valley. Heusel makes an effort to keep his stock up to date by purchasing new blood from the best Eastern breeders at frequent intervals. G. L. Meadows specializes on Buff Orpingtons and Buff Leghorns and has made quite a name for himself in this part of the valley, being a frequent winner at the different poultry shows. Like Heusel, Meadows is no novice in poultry breeding, having followed it for many years. Archie Bassett, who is probably best known for his Poland-China hogs, is also interested in poultry, favoring the Plymouth Rock. Bassett has bred Plymouth Rocks for many years with great success.

Belting That Must Make Good

When you buy a rubber belt you should know what service it will give you or have the belt service guaranteed by a responsible firm who will make good in case the belt falls down. Every belt-buyer should know how to judge a rubber belt, and we would like to send you a free sample of Test Special together with our folder that will tell you just how to judge a rubber belt so that you may know just what service you will get from any belt you buy. FAMOUS LUITWIELER PUMP

Correct in every detail. No trouble. Cheaper water. Perfect satisfaction. 2 Irrigation Booklets free. Luitwieler Pump Eng. Co., 713 N. Main St., Los Ang.

Other Kings County breeders of prominence are H. E. Hill and Raymond Botts, both Rhode Island Red fanciers. Botts has worked up quite a reputation and has shipped birds as far as Honolulu. E. E. Ford favors the White Wyandotte, recently taking the championship at the Lemoore poultry show for the champion bird.

Elias Gallup, although no longer an active breeder, must be mentioned, as he is among the pioneer poultrymen of this county. Gallup introduced the first Brown Leghorn into these parts, the birds being especially imported from Europe.

Among the turkey raisers mention must be made of Clarence Whitmore who took all the prizes worth while at the Panama-Pacific, including the championship for toms. Whitmore also exhibited at the recent Madison Square Garden Show with considerable success.

As in all other counties, the conditions under which poultry is kept vary with the individual poultryman. Most of those who are raising poultry on a commercial basis have adopted the open front house, finding it the most satisfactory. Likewise with feeding, everybody has his own method. The bigger poultrymen mostly mix and grind their own mashes, for, being close to the big west side grain fields, they can save considerable money in so doing.

The commercial egg raisers of the county are unorganized, all shipping as individuals or selling to local business houses. The fanciers however have organized under the name of the Kings County Poultrymen's Association. The association has just held a very successful fair at Lemoore and is planning on holding one in Hanford shortly.

Hooray for the Peach Association

Written for California Cultivator
By Leroy Anderson

I AM not in the business of drying peaches. I aim to ship as many as I can green and dry what I am obliged to. So I have each year from one to three dried tons. I sold the 1915 crop at 2¾ cents with two cents for culls. Last summer I joined the peach association and delivered my dried peaches to the San Jose warehouse in October. The money was paid me, 70 per cent in cash and 30 per cent in a six months' note bearing 7 per cent interest. My San Jose bank cashed the note at its face value, so my total receipts were substantially in cash. The prices paid were; No. 1, five cents per pound; No. 2, 4¾ cents per pound; culls, three cents per pound.

Compare these prices with the prices in 1915 and note what the peach association has done. Lest some one will say that the larger price is due to a short crop in 1916 and not the association, let me say that early in the spring before it was known what the crop would be and while the peach association was being formed, I was offered by packers five cents a pound for my 1916 crop. It may not be that the proposed prune and apricot growers' organization can do proportionately well for its members because prunes and apricots have ruled proportionately higher in price for the past few years than did dried peaches before the association was formed. But had the prune association been working in 1916 it would have given its members a better price than most growers secured and yet had enough surplus to pay all cost of operation.

A word about the "investment" necessary on the part of the growers. On four acres of peaches I took $40 in stock payable in four annual installments, making ten dollars due in in 1916. When one sees the greatly increased price obtained this year over 1915 it is plain that the little ten dollars was not hard to pay, the few culls alone paid that and I did not feel it. So don't consider the small amount of stock taken in the prune and apricot association as an investment, over which the grower must ponder for many weeks. Consider it rather as an insurance against speculation, against gambling, against ruinous prices and against all the other evils of the present marketing system.

As the Crow Flies

Getting Firestone Tires to You at Lowest Cost

THEY come to you with the least possible handling, delay and expense.

Firestone efficiency does not stop at the factory. Having cut out all needless expense in production, we save you more by "cutting the corners" in delivery.

The Firestone transcontinental system of distribution means getting the tires to the dealer and from him to you in the cheapest, quickest, most saving way.

Wise motorists everywhere know that their safety, economy and comfort are safeguarded by the "Word of Honor," Firestone name, which gives the assurance of personal responsibility.

Free Offer: A Firestone Cementless Tube Patch free, if you will send us your dealer's name, and the make of your tires.

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertiser in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

THIS WEEK'S COVER

Through the courtesy of the Los Angeles chamber of commerce we give on the cover of this issue a scene taken in a Los Angeles County poultry yard. There are now shipped from California to various Eastern points carloads of winter produced eggs. At this moment these are not being shipped with any great profit to the producer, but with the new cooperative organization of this state in action we believe another season will show this winter business most profitable. Feed is extremely high and only cooperative buying in large quantities will let poultrymen live.

SAVE THE SEED

The department of agriculture is sending warning to farmers all over the United States to hold back at least sufficient of the present wheat crop for seed for the coming season's planting. The fall or winter crop will be exceedingly short because of the drouth which has generally prevailed over the country. Now the department fears that with wheat above the $2.00 mark the plumpest and best of the seed will be disposed of so as to cause a second year's shortage in the crop.

SECOND CLASS POSTAGE

The newspapers which have not been crowded out of existence by high price of paper and other things, some of which may be appreciated by our readers, are watching congress and asking what it proposes to do with the rider on the annual appropriation bill which provides that second class matter shall be subject to zone rates. The newspapers are already "treading water" to keep their noses above. If the postoffice department adds another burden some of the most helpful publications of the country will cease to be. Congress may be in desperate strait to make up the deficiency, but we believe the last place this burden should be settled is on the press of the country.

VISIONS OR DREAMS

At the meeting for organization of the poultrymen of Southern California Mr. Davison of Riverside County, in appealing for a step forward in the poultry industry, referred to the fact that while old men are dreaming dreams, young men are seeing visions. then called on those who are "young" enough to see a bit into the future to stand as one in action for progress and for business development amongst poultry people. There are thousands of dreamers, but few seers of visions; perhaps fewer doers who bring the vision to reality. If cooperative effort is to win we must have more seers and fewer dreamers. Bear in mind that years do not necessarily mean age.

SOME LOSSES

We would be richer by millions—this is not the editorial we—if it were not for the extremely heavy losses to agriculture. Few other callings could stand up under such enormous losses. For example, we note in the "Harvester World" estimates—true, only estimates, but indicative of some of these losses—that improper harvesting and failure to test seed corn cost the American corn farmer $250,000,000; not using acclimated seed corn, $100,000,000; ravages of corn root worm, $100,000,000; wasted corn stalks, $500,000,000; smut, $35,000,000; waste of manure, $100,000,000; weeds, $300,000,000. To all of which may be added losses from hog cholera, Texas tick, and a thousand and one other things, making an appalling total.

How to stop this is a long question, but the first step which must be taken is to get more information and get it in working trim. Scientists, schools, farm papers and other agencies are endeavoring to aid in this campaign. Of them all the farmer's will in the matter is the first essential.

MORE POULTRY

California is watching its magnificent exports of midwinter poultry products with no little pride. The poultry industry is increasing in this state most wonderfully in the past few years. Instead of importing a hundred or more carloads of eggs we are now sending strictly fresh ranch eggs to snowbound New York. Small express shipments have been made in former years, but carload shipments to the East are new. We believe this industry will grow, although at this moment poultrymen are holding up their hands and exclaiming, "What shall we do when one dollar's worth of feed makes only 75 cents worth of eggs." We believe this condition is only temporary and that the poultrymen will increase even more that feature of agricultural production which is now practically our greatest. The Cultivator hopes to aid in this campaign and has commissioned Mrs. Koethen to give a series of articles on best and cheapest feeds. She starts with green feeds, the first article of the series appearing in this issue. We will be glad to hear from subscribers with other suggestions.

POINTS OF ENTRY

The state horticultural commission has issued a circular letter, primarily intended for the county commissioners, which refers to the possible establishing of definite points of entry in each county; trees or plants for sale in that county to be forwarded to the entry point where competent inspectors will examine all stock and certify to its right to entry. Such a feature would generally be acceptable to the commissioners and as generally not acceptable to the nurserymen, and we may add that the orchardist would find in the plan many objections. The state commissioner in stating the case gives amongst the principal objections which have been mentioned: "The poor transportation facilities in some of the counties which would necessitate considerable delay in delivery, with the danger of the stock drying out and the great difficulty of repacking a lot of trees for reshipment to final destination after inspection. Just what action will be taken finally has not yet been decided. Careful consideration is being given to every phase of the plan, and when a decision is reached it will be with a knowledge of all the arguments for and against and a just consideration of all parties who would be affected by the establishment of such points of entry."

MAKING FARMERS

There is in this country a society known as the Jewish Agricultural and Industrial Aid Society whose work has attracted the attention of the International Review of Agriculture and Economics published by the International Institute of Agriculture at Rome. This society is in touch with some 3718 families of Jewish farmers now cultivating in this country 347,000 acres of land which with appurtenances and equipment, aggregate in value in excess of $26,000,000. This is estimated to be about 50 per cent of the total Jewish farming population of the country. This agricultural society is developing along various lines, but primarily its object is to grant loans to worthy applicants who are unable to secure money through the regular channels. For example, the owner of a farm now covered with a first mortgage may, under certain conditions, secure from this society a loan on long time at four per cent.

But before securing the loan the would-be farmer must secure experience, as it has been found too costly for him to acquire it afterwards. Hence the first step in helping the inexperienced applicant is to find work for him as a farm laborer. Then unless the applicant has thrift enough to have acquired at least $1000 he must make a wonderfully fine showing before he can secure any additional help. The society states that it carries on no "back to the land" propaganda. On the contrary it finds that its greatest task is to prevent those who are unfit from embarking on a venture for which they are ill prepared and in which their chances of success are extremely remote.

In this there is a lesson for American rural credit claimants. The back-to-the-lander who would leave an office in the city and become a full-fledged farmer must be brought to realize that just as there is necessity for several years preparation for professional life, so there is for the vastly more complicated calling of agriculture, in spite of the impression which seems to prevail that all that is needed is the desire. California must give heed to some of the suggestions made by the Commission on Land Colonization and give information as to real values of land and requirements which the farmer must meet.

BIG SEED COMPANY
IS DISTRIBUTING NEW CATALOG

Aggeler & Musser Seed Company
OF LOS ANGELES
Issue 24th Annual Book

One of the largest seed houses in the West, the Aggeler & Musser Seed Company, Sixth and Alameda Streets, Los Angeles, have just received the first edition of their new 1917 catalog and are giving it broadcast distribution. This is their 24th annual catalog, and it certainly surpasses any previous edition.
It contains many new features, such as hints to the home vegetable gardener, how gardening may be made easy, etc. In fact, the supplementary booklet called the "Garden Manual", which heretofore has been printed separately, is this year incorporated in the big annual, and it is claimed to be one of the most complete seed books published. It contains answers to more than 1000 questions and gives information regarding all varieties of plants listed and is fully illustrated. Not only does it tell all about seeds, but gives full data concerning the correct tools and implements agriculturists should use to obtain the best results. Valuable hints on poultry, fertilizing and the use of insecticides are also given.
The Aggeler & Musser Seed Company will gladly send this descriptive, illustrated and interesting catalog, free and postpaid, to anyone writing and requesting it.

Agricultural News Notes of the Pacific Coast

Northern California

Yolo County is to have a mosquito abatement district.

W. H. Browning of Woodland recently shipped a bunch of pedigreed Poland-Chinas to Panama.

The annual meeting of the California Sheep and Wool Growers' Association was held at Davis January 5-6.

At the recent annual meeting of the Paradise Fruit Growers' Union J. N. Bille was elected president and R. Charlton, secretary.

The California Shorthorn breeders organized an association recently in San Francisco. T. S. Glide of Davis was chosen president.

Large plantings of sugar beets will be made in the section near Ccico. One reason for the planting is to get rid of the yellow thistle pest.

Five thousand four hundred acres of sugar beets are assured of planting in the district about Chico, Butte County. The beets will be shipped to the factory at Hamilton City.

Horticultural Commissioner Moulton of San Francisco has given notice that all frozen oranges sent to the San Francisco markets will be confiscated if 15 per cent of the fruit shows frost drying.

Wm. Gould, Yolo County horticultural commissioner, states that there will be a large acreage of French prunes, Thompson Seedless and Sultanas put out next spring, Sultanas being in the lead.

Approximately 4000 acres of rice next year is the outlook for Yolo County. The crop this year averaged about 45 sacks per acre. Ninety-eight per cent crop is harvested with no injury from rains.

The Sonoma County Development Board is moving to secure a highway lateral across the county from the Black Point cut-off through Sonoma, Santa Rosa, Sebastopol and Guerneville to the ocean.

One of the silos on the university farm at Davis was filled this fall with Sudan grass which will be used in feeding dairy cows in order to determine its value in comparison with corn and other sorghum silage.

Potato Expert Shear is making final inspection of seed potatoes in the Fruit Ridge and Camino districts of Eldorado County. There are heavy plantings in this section and growers are feeling correspondingly wealthy.

State Horticultural Commissioner Hecke is working with the weed elimination committee of the Sacramento Valley Development Association in a thistle campaign. Local committees are being appointed to work with the general committee.

Central California

Plans are already being made for the citrus fair at Visalia next year.

Methods of pruning grapes were discussed by Prof. Bioletti at Hanford last week.

A cream pooling association has been formed by the Patterson Colony of Stanislaus County.

Fresno County farm bureaus are still working to secure the appointment of a farm adviser.

Smudge pots have been used this year in Tulare County more extensively than in former years.

Visalia shipped out more than a dozen carloads of live stock last week, most of them going to San Francisco.

Lindsay, Tulare County, had shipped up to December 20, 1489 carloads of oranges. The shipping season will last for another six months.

On December 15 the three creameries of Tulare paid out $110,000 for November cream deliveries. This is $9000 more than October payments.

At the recent annual session of the State Farmers' Union at Modesto, D. M. Utter of Campbell was elected president and Fred Millard of Los Angeles, secretary.

At the present time cream from over 2000 San Joaquin County cows is sold through farm bureau cream pooling associations. This means a yearly business of about $150,000.

The state board of control has announced that this state will provide funds for the purchase of rights of way for the Stockton channel. This is a big gain in Stockton's fight for a 20-foot channel that will allow ocean-going vessels to land at its wharfs.

A meeting was held in Hanford December 20 in the interests of the State Prune and Apricot Growers' Association. Manager Madison of the Associated Raisin Company was the principal speaker. Manager Niswander of the California Peach Growers also spoke.

Representatives of eight irrigation districts in the San Joaquin Valley have approved plans for building a conservation dam in Fresno County. A later meeting will be held to report on costs of the project with a view to consolidating all the territory depending on Kings River for irrigation water.

The Ripon Farm Center Pooling Association has let its year's cream supply to the Stanislaus Creamery for four cents net above San Francisco market quotations. At the present time there are over 1200 cows in the association, which has a membership of practically all dairymen of the Ripon section.

Southern California

Imperial County held a successful live stock fair December 27-30.

San Bernardino is making plans for the National Orange Show in February.

The orange crop of Hemet Valley this year gives promise of being the largest ever, at least 125 cars.

The annual meeting of the Fontana Poultry Association was held at Fontana January 8 at 7:30 p. m.

The El Cajon Farm Loan Association met in El Cajon on January 9. H. Culbertson is president.

The Montalvo and Saticoy bridges in Ventura County are to be opened for traffic the first part of January.

It is now definitely announced that the cannery on East First Street, Santa Ana, will be opened next season.

The Riverside chamber of commerce is planning for a diversified crop institute to be held at Riverside January 19-20.

Imperial County holds second place in the state as butter producer. Stanislaus heads the list. Humboldt County is third in order.

A suit has recently been filed against the city of San Diego for destruction of a ranch by the breaking of the Otay dam last winter.

Bean warehouses of Ventura are rushing work in cleaning beans damaged by October rains. The work is being pushed day and night.

Because of continued irrigation difficulties some ranchers of the Hemet Valley are proposing that the irrigators themselves acquire the water system.

An effort is being made in Ventura County to have the supervisors reverse their action in refusing an appropriation to carry on the work of the county farm adviser.

Fruit growers associations of California are happy over the deferring of the freight rate raise. The rate was to have become effective December 30 but will not now be put into effect until March.

Four hundred poultrymen of Southenr California have formed a marketing association which will maintain headquarters in Los Angeles. Four hundred thousand hens are represented by members of the association.

A poultryman of Arlington, Riverside County, claims that he is getting 100 per cent more eggs by turning on electric lights in his poultry houses at 4 a. m. and again at dark in the evening. By his lighting system he gives his hens a 15-hour work day.

The Coast

Nine dollars 95 cents and ten dollars are reported as the highest prices being paid for lambs in the Portland market.

Yavapai County breeders of Angora goats estimate their mohair clip for next season will be worth at least a half-million dollars.

Southern Oregon beet growers are being offered $7 a ton for their 1917 beets. Last season's prices ranged from $5.50 to $6.00.

An egg-laying contest will be begun February 1 under the auspices of the Phoenix union high school. The contest will close May 31.

At the live stock show recently held at Lewiston, Idaho, beef cattle largely predominated. There was also a large showing of draft horses.

Cranberry growers of Oregon and Washington are preparing to put a new drink on the market, the base of which is to be cranberry juice.

The fourth annual meeting of the Arizona Farm Improvement Association was held at the University of Arizona at Tucson January 8-13.

Berry growers of the Nooksack Valley of Washington have organized a marketing association. Most of the growers are raising raspberries.

A movement is on foot in Arizona to ask the next legislature for an appropriation for permanent agricultural buildings on the state fair grounds.

Prairie dogs are a great pest in the Sulphur Springs Valley of Arizona. A spring campaign has been planned against them by County Agent Paschall.

About 325,000 bushels of wheat will be handled through the four farmers' elevators of Wasco County, Oregon, this year at Maupin, Boyd, Rise and Emerson.

The Oregon State Horticultural Society held its annual at Hood River last week. Marketing and car shortage problems were the two principal subjects discussed.

The Skookum Fruit Products Company will establish a by-products plant at Wenatchee, Washington. The main products will be sweet cider, jellies, vinegar and evaporated fruits.

A Holstein bull sold at Portland recently for $21,500. The animal was Finderne Mutual Fayne Valdessa, sold to John von Herberg, who has a Holstein herd in Kent, Washington.

To encourage corn culture a national bank of Spokane is planning to distribute prize winning corn free to farmers. This corn was selected at the National Corn Show recently held in Spokane.

BREEDING -- TYPE -- PRODUCTION
UNPRECEDENTED PRICES

We have just a few left old enough for service. Their sires and dams are proven producers and our prices are so low that no dairyman can afford to use an inferior sire.

Look these over:

No. 1. Born March 16, 1915. Sire, ARALIA DE KOL PONTIAC SEGIS, son of the 30-pound 12-year-old cow, ARALIA DE KOL, 1142 pounds butter in a year from 28090 pounds milk. Dam, MISS LUIT WALTER BURKE, a daughter of PRINCE GELSCHE WALKER from a 32.76-pound 4-year-old daughter of DE KOL BURKE. His dam made 16.83 pounds butter in 7 days and 540 pounds in 10 months as a junior 2-year-old. He is a model in type. First prize yearling at Fresno district fair. Price $250.00.

No. 2. Born September 9, 1915. Sire, ARALIA DE KOL PONTIAC SEGIS. Dam, RIVERSIDE SEELY GIRL, 795 pounds butter and 17591 pounds milk in one year. She has a 21-pound 2-year-old daughter that made 751 pounds butter in a year. Price $200.00.

No. 3. Born December 15, 1915. Sire, ARALIA DE KOL PONTIAC SEGIS. Dam, Miss BLANEY PONDYKE, 21.52 pounds in seven days as a 4-year-old. Her sire is by KING OF THE PONTIACS and has two 30-pound daughters. His dam made 27.60 pounds in 7 days and 1008 pounds in a year. Price $150.00.

Pedigrees and further information on request.

New Years Records

Written for California Cultivator By W. S. Guilford.

RESOLUTIONS are good things if carried out. Let one of these be to make records of the essential farm transactions so that at the end of the year an accounting may be had that will show what progress has been made and along what lines, and if anything has not gone well it should make it easy to locate the policy of operation at fault.

After the holiday season is passed is a good time to make an accounting, which will begin with an inventory of stock, equipment and supplies on hand. This checked with an account of income and expenses, and a comparison with last year's inventory, gives a splendid idea of the standing of the business, and if there is no last year's inventory, or any 1915 accounts to check by, now is the time to start a system that will put the farm on a business basis.

There need be no great formality about this farm bookkeeping system. There are very useful farm bookkeeping sets for sale. The Cultivator has a very complete set of forms at a reasonable price.

Then, after the inventory, a daily record of expenditures and receipts will be easily kept and provide a record of the year's operations. Then, if at any time it is necessary or desired to segregate any account, such as the number of hogs sold and their value, this can readily be obtained from the record of receipts.

There is a fascination about records of this kind, and when anyone starts to keep them and keeps at the job long enough to get an interest in it, it will prove a favorite occupation for many an evening.

Turkeys and Dogs

Dogs and poultry are not commonly thought to mix well, but the dog is a very useful adjunct to turkey growing in the Sacramento Valley, as is indicated in the accompanying picture which shows a band of turkeys with the caretaker and his dog. The dog drives the turkeys the same as he would sheep.

Thousands of turkeys for the Thanksgiving market are now being fattened on the stubble fields where they get grain and grasshoppers.

Great care is necessary in raising these big bands of turkeys and they require careful attention constantly. The band of turkeys shown in the picture is near Orland in Glenn county. —W. S. G.

Let the Sunshine In

Many young pigs are being farrowed now, and on a good many farms in order to protect them from the rain and storm it is necessary to put them in barns and sheds where they do not get much sunshine. And sunshine is one of the things a young pig needs. You can almost see healthy, well fed young pigs grow when they can run around in the bright sunshine and lie in some warm protected spot on the south side of a building or fence.

Whenever the sun shines in the winter time doors and windows should be opened to let the sun into every possible spot in the buildings in which animals are kept. Germs of disease thrive in moist, dark places and unhealthy atmospheres and foul smells are not found in the bright sunshine.

Breeding Conditions

There has been a lot of discussion in California since the Panama-Pacific Exposition about what constitutes "breeding condition." The question is "Can animals be fitted so as to win at the shows and retain their breeding qualities?" And just how fat must they be to win?

Here is some light on the subject from Wallace's Farmer:

"Many a breeder of improved stock has fallen just a little short of success through a wrong notion of what constitutes breeding condition. When we visit a breeder for the purpose of buying a young bull, and he remarks on the way to the barn: "I don't pamper my young cattle; I keep them in just good breeding condition," we find as a rule that his bulls are altogether too thin in flesh to do justice to themselves or to him.

"He is a rare man who can form an

Raise Your Calves on

Blatchford's Calf Meal

and Sell the Milk

More calves have been raised on Blatchford's Calf Meal than on all other milk substitutes combined.

100 lbs. makes 100 gallons of milk substitute, costing only one-third as much as milk. Prevents scouring and insures the early maturity of sleek, handsome calves. It is steam-cooked and no trouble to prepare or use.

Write for Pamphlet "How to Raise Calves Cheaply and Successfully with Little or No Milk." At dealers, or Blatchford Calf Meal Factory, Dept. 8 Waukegan, Ill.

Berkshire Hogs—Milking Shorthorns
Breeding Stock For Sale
C. A. Murphy, - Perkins, Cal.

accurate judgment of a young bull when he is thin. The average buyer wants to see young stuff in good, smooth flesh. This does not mean overfat; but there are very few young bulls which have been injured by carrying too much flesh during the first year of their life. It takes feed, and plenty of it, to present a young bull in attractive sale condition; but it pays even in these days of high-priced feed; and the sensible buyer will demand it, first, because it indicates that the bull is a good feeder, and, second, because it gives him a fair opportunity to judge of its quality. Improved stock is fetching good prices; and those who are preparing young stuff for sale can well afford to feed liberally. In fact, they can much better afford to do this than not. It is all well enough to carry through the breeding cows in just good, strong breeding condition, but with young stuff a liberal hand has its reward."

Advertising That Money Cannot Buy

Since Professor Gordon H. True of the state university farm went to the Chicago International with two California bred steers and startled the whole livestock world by bringing home the grand championship and reserve grand championship, the writer has stated on numerous occasions that a half million dollars would not cover the advertising benefit which will accrue to California through this great achievement. I note however that Mark Bassett of Hanford went even farther when he stated in a recent Cultivator that money could not pay for the good this winning has done for California. The more I think it over the more I see where Mr. Bassett is right. It takes only a superficial knowledge of advertising values to figure out half a million dollars' worth of benefit, but when we think right down to advertising brass tacks there is almost no limit to the good Professor True and his two steers will do California.

It only brings out once more, and this time in the most forcible manner yet, that the people of the East and Middle West, the kind of people that we want and need on California farms, have for years been filled to the ears with the "land of sunshine, fruit, and flowers" press agent stuff. For years every chamber of commerce, commercial club, and real estate firm in California has contributed to the flood of literature sent East to attract settlers, and out of thousands upon thousands of tons of such matter practically all of it has painted California in the gold of the orange and the purple of the grape. The effect of all this has been to build up an impression that California grows nothing but fruit.

The first real tangible evidence that the East ever had of the existence of farm animals in California was when our breeders of dairy cattle began to break world's milk and butter records with perfect abandon some years back. Thus California came to be recognized as a dairy state of the first rank.

Probably no cornbelt farmer would have been so foolish as to consider seriously the possibility of California producing an International Grand Champion steer—before the last International. But now there are tens of thousands of beef cattle men throughout the world who know positively that California has produced an International grand champion steer, and the reserve grand champion as well, and that she did it without feeding a single ear of corn, which is rank heresy in the mind of the corn belt farmer.

It often requires a real jolt, something spectacular, to drive home to the minds of a busy people even almost self evident truths. The livestock world has now been jolted into the consciousness that California can produce the best steers in the world on a ration of alfalfa, barley, and the other feeds we grow in abundance. There are no doubt thousands of men back East who prefer to stick to beef cattle farming as their life work and who would long since have engaged in their favorite business in the favorable climate of California had they known they could really raise good beef out here. Thanks to Professor True, and not forgetting Alex McDon-

Why Let Your Cows Slink Their Calves?

What is Abortion in cows?
A contagious, communicable venereal disease that is costing the breeders of the U. S. millions of dollars yearly.

Can this disease be prevented or overcome?
It can be prevented and overcome.

What do the agricultural colleges say?
Some say it can be prevented and overcome and others say it cannot be.

What does the U. S. Government say?
The U. S. Government recommends the hypodermic treatment as the very best method of combating this disease.

Who says that Abortion cannot be prevented and overcome?
People who have not used the Roberts treatment, or who have used only part of the treatment and not according to instructions.

Who says that Contagious Abortion can be prevented and overcome?
The owners of 5,000 herds of cattle who have treated their cattle from one to four times during the past 25 years, owing to the fact that their herds had become reinfected through new animals purchased.

Has this treatment always proved successful?
No; because the directions have not been followed.

Does Dr. Roberts claim that this treatment will wipe Abortion out of any herd regardless of how long it has been afflicted?
Yes, absolutely; providing the cattle are free from tuberculosis and providing directions for treatment are followed.

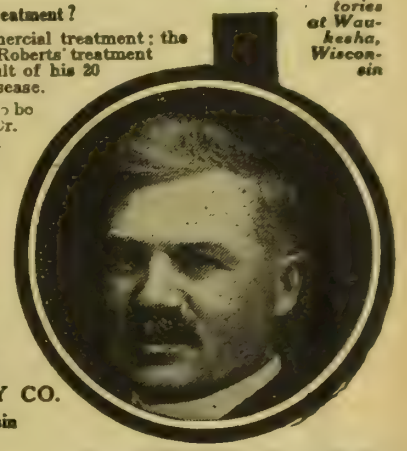
What evidence is there that this is true?
Animals and herds that were pronounced incurable by veterinarians and owners after having many kinds of abortion treatments given and applied to them have been successfully treated by Dr. Roberts and have been given splendid 7-day and yearly records. Lynden Grove Betsy De Kol, 5 years old—yearly butter record 721.49 lbs. and 18,563 lbs. of milk—is a typical case.

Do agricultural colleges indorse the Roberts treatment?
No; Agricultural Colleges cannot indorse or recommend any commercial treatment for live-stock diseases.

Does the U. S. Government recommend the Roberts treatment?
The U. S. Government cannot indorse any commercial treatment; the Government bulletin, however, embodies all of Dr. Roberts' treatment except these additional values, which are the result of his 20 years' scientific work and personal study of this disease.

All Abortion treatments are shipped direct from our laboratories at Waukesha, Wisconsin

If Dr. Roberts can buy infected herds, knowing them to be such, and by his treatment wipe out the disease; if Dr. Roberts can introduce the disease into a herd through infected animals, then check it and wipe it out; if Dr. Roberts can keep his own valuable herds of pure bred cattle free from tuberculosis and contagious abortion, it proves that it can be done. *Dr. David Roberts has done these very things and what he can do you can do if you will do as he tells you to do.*



There is a Roberts medicine for every animal ailment. Sold by nearly 4000 druggists; if not at yours, write us direct, give your dealer's name. Look for and insist on getting the package bearing Dr. Roberts' picture. Dr. Roberts' great "Practical Home Veterinarian," 184-page cloth-bound book, will be sent you postpaid for $1.00.

California Swine Breeders

Plans Worked Out for Program, Which Will Create Great Interest. Automobile Trips About Los Angeles Will Add to Pleasure

THE annual meeting of the California Swine Breeders and election of officers will be held in Blanchard Hall, Los Angeles, Thursday and Friday, January 18 and 19. Headquarters of the association will be Hollenbeck Hotel. The swine industry never commanded the attention in California that it does today, and there are many problems which call for discussion. One of the live questions before the coming convention will be that of prices. The packers of Los Angeles are taking a special interest in this meeting, and one of the addresses noted below is to be on why California packers do not pay Chicago prices. Presumably there will be a discussion on this topic which will show some life. Note in the detail of the program below that there will also be a killing demonstration at the Cudahy Packing Company, a cutting display at the Wilson Packing Company, and inspection of plant and luncheon at the Hauser Packing Company. These will all be most interesting features of this convention. In detail the program will be:

Thursday, January 18, Blanchard's Hall, Los Angeles. Headquarters: Hollenbeck Hotel.

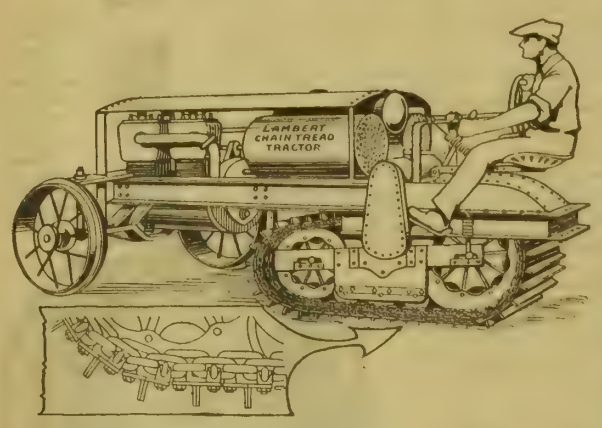
9:30 a. m., business session; 10, "The California Swine Breeders' Association," C. B. Cunningham; 10:10, "The Swine Business," Hon. Jas. Mills; 10:30, "Feeding Growing and Market Hogs," Leon L. Lamson; 11, "The Breeding Herd and the Pure-bred Business," Wm. Bernstein; 11:20, Discussion: Feeding Problems, Self-Feeders, etc.; 1:30 p. m., "Why the Prices of Swine in California are Lower Than in Oregon or in the Middle States," F. I. Washburn; 2:15, "Why Strictly Grain Fed, Milk Fed, Alfalfa Fed, and Acorn Fed Hogs All Bring About the Same Price in California," Frank Hauser; 3, "How to Market Hogs in California," Harris Weinstock; 3:35, "What Is Being Done and What Should Be Done for the Good of the Swine Industry in California," D. O. Lively; 7:30, theatre party.

Friday—8:30 a. m., killing demonstration at Cudahy Packing Co.; 10, cutting display at Wilson & Co. packing house; 11:30, inspection of plant and luncheon at Hauser Packing Co.; 1 p. m., visit to moving picture studios and other points of interest in Los Angeles.

The railroads have granted a rate of a fare and one-third on the certificate plan. —J. I. Thompson, Secretary.

Secretary Wiggins of the Los Angeles chamber of commerce is anxious for more autos. Many have been promised, but present indications are that the attendance will be large, and anyone near Los Angeles who can come with machine on Friday morning should report at once to the chamber of commerce.

HAVE YOU SEEN IT?



If not you had better investigate it before buying or you will wish you had. No other tractor like it. No other tractor that has a track like this. No other tractor has a track so cheap to keep in repair. No pins or bushings to wear out in this track. No other tractor which has a straight pull regardless of where the hitch is made

Nothing but chains to hold this track together. Simple in construction. easy to operate.

COME AND SEE IT OR WRITE FOR PRINTED MATTER.

Breed More Draft Horses

By Wayne Dinsmore

DANGER of overproduction of horses is remote. It costs more to produce them than any other class of live stock. For that reason many farmers sit back and proclaim that it doesn't pay to raise horses, that there never was a time when the horse market was so dull as now, that the motor truck and tractor have killed the horse business and the horse is a thing of the past. Those who have allowed such thoughts to direct their operations for the past five to ten years will soon see the error of their ways. It takes time to make much headway in the horse business. Five years are needed to grow a horse. At best one should not expect more than two colts from three mares as an average per year. Moreover, not more than 16 per cent of our farmers are raising colts. Not long hence the American farmer will wake up only to learn that a great opportunity has passed. There are plenty of men who have bought and paid for farms within the past ten years by their pure bred draft mares. In the same community there are farmers who are no better off financially than they were a decade ago because they failed to foresee the profits from using the right kind of horses in their farm work. The men who have made money and who are going to reap the fruits of their efforts in the future are those who early saw the undeniable need for heavy draft horses for farm work, who bred that kind and who will continue to do so without a halt.

A careful consideration of the situation cannot fail to convince us that there is no danger of an overproduction of heavy draft horses for our farm and city uses. Almost a million horses and mules have been exported from this country in the last 27 months for use in war. These figures show almost one horse or mule taken for every 25 left. As surely as this war continues another two years, good farm horses will be at a premium, and even after the war is over exports will not cease, for thousands of horses will be needed to start European agriculture anew.

We are producing only 12,000 or 13,000 pure bred draft horses eligible to registry. This means, in substance, that we are producing only 5000 to 6000 stallions fit for service per year, when we need at least 7000 or 8000. An excess of demand over supply always makes good prices, and the present is no exception.

FOREST GROVE LAUREL 8TH
First and Reserve Grand Champion
California State Fair 1916

The Type We Are Breeding For

Hardy, prolific sows of best blood lines and breeding. Strong, upstanding, prepotent boars. In short the best possible specimens of the Berkshire breed. We plan to do this by breeding large numbers and from them making a rigid selection.

James Mills Orchard Corporation

Hamilton City, California

Live Stock Field Notes

Fontana Ranch Company, San Bernardino County, have just imported a classy Duroc-Jersey boar from the East. He is only one of many on this ranch which probably markets the largest number of market hogs of any one plant in the state. It also has a large herd of Berkshires.

Peters, Lamson & Walker, for many years the premier Duroc breeders in the Imperial Valley, have sold out their land holdings and moved closer to Los Angeles. They brought along the pick of their wonderful bunch of sows and are busy building accommodations to take care of some 250 head of brood sows.

A. M. Draper of Imperial County has been assembling a purebred herd of Holsteins the past year. At the Imperial Valley fair he showed his best cow, Nancy Mercedes De Kol 114814, a daughter of Sir Mercedes DeKol Netherland, and won first and grand champion. Mr. Draper will do official test work as soon as he makes the necessary improvements on his ranch.

Hollow Hill Guernsey Farm, Riverside County, recently purchased a string of fine females in Ohio and Pennsylvania, which, added to their already large collection of Guernseys, makes this farm one of the largest in the state. Purebred Berkshire hogs are grown here also, and they have a regular show bunch of sows and boars. There are ten cows on official test at the present time.

Stalder Bros., Riverside County, are running several of their Holsteins on official test. This herd has several 30-pound prospects and one or two females which have already gotten in this select circle. A. J. Stalder is considered one of the keenest business men in Southern California, and he values his Holstein herd above any one of his many interests.

Bringing a comparatively new breed of swine into a section where the other breeds had been established for a decade and making them so popular it is with difficulty enough good individuals can be produced to supply the demand, is the record of the Llano Vista Hampshire herd of Riverside County. Mr. Langdon, the manager, says he grows 200-pound barrows at six months of age which are snapped up by the killers as fast as they are finished. The herd is composed of 1915 world's champions, exhibited by Walter Gatton at San Francisco and purchased from him early this year by the Llano Vista people. Sioux Queen, the P.P.I.E. grand champion Hampshire sow, has farrowed a bunch of typey pigs.

COMMERCIAL HELPS AND HINTS

The Coulson Poultry and Stock Food Company of Petaluma issues a very valuable booklet entitled, Chickens, From Shell to Market. It contains general information for the beginner and the experienced poultryman and may be had free for the asking. Every reader should get a copy.

You can always sell your first class poultry to the California Poultry Company, 315 Washington Street, San Francisco. This is the largest concern of its kind on the coast and the treatment accorded its patrons has been universally satisfactory.

Mr. J. E. Kresky, of Petaluma manufactures a brooder stove which is particularly valuable for those having 100 chicks or more. His circular is full of brooder information and will be sent free to those interested.

Have you heard about the Electrified Hen? It is an electric incubator manufactured by the Petaluma Incubator Company. With the use of electricity in so many household ways it is only natural that it can be used to advantage in the hatching of eggs. An interesting circular giving full description of this new incubator will be mailed without cost to readers of the Cultivator. Better write for it.

A very valuable booklet "Makes Hens Happy" has just come to our attention. It is issued by the Sperry Flour Company of Stockton and will be sent free. It also contains some freight coupons which are of actual money value in the purchase of goods from this company. We recommend this booklet to every poultryman.

If you are interested in a silo don't fail to write to the Redwood Manufacturers Company of San Francisco. A booklet issued by this company contains much information which will be of immense value to every stockman and farmer. The booklet will be mailed free to those who are interested in building a silo.

This is the Roof Covering You Want

Everybody Praises it—ELASTIC-GUM-COATING is just the thing for covering roofs—Cheap and Efficient

Here is just the roof covering every California home owner should have—ELASTIC-GUM-COATING. It stops leaks, preserves wood, is low priced and easily put on. It cannot crack, scale or blister. Thousands of gallons being sold. Has strongest endorsements of California ranchers and dealers.

Send today for free descriptive circular, price list and sample offer. If your dealer does not yet handle ELASTIC-GUM-COATING, write direct to

Purebred Registered
HOLSTEIN CATTLE

During the fiscal year ending April 30, 1916, there were reported to the Advanced Registry Office of the Holstein-Friesian Association, 11,868 short time official records, over one half of which were by heifers with first or second calves. The average seven-day production of these 11,868 animals was 401.1 lbs. of milk, containing 3.53 per cent of butterfat. These figures emphasize the fact that Holstein merit is based, not on individual records, but upon the wonderful uniformity of high productiveness of the purebred Holstein cow. There is big money in the big "Black and White" Holsteins.

Eye Trouble

I have a four-year-old mare that has had a scum over one eye for several months. She appears to see well out of it. Would like to know the cause and what to do for it.—Subscriber, Goleta.

First examine the eye to see if there is not something in it. Turn the lid back and look for a seed of fox tail grass or something that may be bedded in the eyeball or the inside of the lid. Wash it out with water that has borax dissolved in it. Get your druggist to prepare a lotion of one dram of boracic acid, one dram of granulated sugar, ten grains of atropine and enough water to make four ounces. Put some of the lotion in the eye every evening but do not squirt it in with a syringe or he will always be shy about the head. Use a small sponge or some surgeon's cotton tied on the end of a small stick, dip it into the lotion and squeeze it out inside of the lid.

Locomotor Ataxia

I have a valuable horse that lay down in the corral about five weeks ago and has been unable to get up since without being helped with slings. Have had him in slings most of the time since but he is still unable to walk without staggering until he nearly falls. Have had four veterinarians to see him but none could decide what was wrong. They have tried several remedies but all have given it up He seems in good health otherwise but is so unsteady on his hind legs that he gets them terribly mixed up when walking for a short distance. I leave the slings loose during the day but draw them up snug at night. The horse has not been worked for some time but I will need him again next month. Can you tell me what ails him and what to do for him?—Subscriber, Charter Oak.

Something wrong with the spine. It may be due to a hard fall or it may be forage poisoning. Sometimes mild cases of forage poisoning last for a long time. Try this and please report to us again in two or three weeks: Get a liniment of one ounce each of spirits of turpentine, oil of origanum, ammonia and tincture of capsicum, four ounces of alcohol and eight ounces of water. Apply it to the loins once a day. Also have the druggist prepare ten powders each containing four ounces of epsom salts, two ounces of common salt and two drams of powdered nux vomica. Give one powder once a day. Lift his head as you would to drench him and spoon the medicine down dry. Be sure he gets it all. If it loosens the bowels very much then give a powder only once in two days. After giving him two or three powders take the sligns off and let him lie down. He will probably rest for some time and then get up without assistance. If not then help him with the sling. Let him lie down every day if he will. Be sure to give the powders and you will probably be working him again in a month.

Cow Pox

Will you kindly describe and prescribe treatment for cow pox which I believe my herd has? Small blisters appear on the cows' teats which finally turn into sores which I am unable to heal permanently. Have been using vaseline in which I have put a liberal amount of cresylol. They improve for a time but break out again as bad as ever. The trouble started with a heavy milking heifer.—Subscriber, Tipton.

You have described the disease very well. It is due to a germ that is found in the pustules. It is easily carried from one cow to another on the hands of the milker. Those that have the disease should be milked last, and it is best to wash the hands after milking each cow. The udder should be washed before and after milking and the sores anointed with an ointment made of tincture of iodine one ounce, iodine crystals one dram and lard oil

four ounces. A handful of epsom salts in the feed once a day will also help to shorten the course of the disease.

Corn Fodder for Horses

Please tell me through the Cultivator if it is safe to feed corn fodder to horses. This corn fodder was cut after the corn was matured but the stalks were partially green, and it has been stacked up two or three months and is dry. Some claim that corn fodder will kill horses.—Subscriber, Encanto.

My experience with feeding corn fodder to horses has been in the Eastern states but I believe that corn fodder in California is the same as corn fodder in Ohio. I have never known it to kill or injure a horse. It is rather unhandy when feeding the stalks whole as horses will only eat the leaves and the soft part of the stalk. If cut in inch lengths they will eat much more of it and the parts they refuse will be easier cared for in the litter, but best of all is to shred the fodder. In the East where more corn is raised they use a machine that husks and shreds the fodder at the same time and the farmers consider the shredded fodder fine feed for horses. It is easily digested and is a more laxative feed than barley or oat hay.

The Green Feed Calendar

Written for California Cultivator by Jean A. Koethen

CALIFORNIA, unlike the greater part of the United States, is a land of two seasons. It would hardly do to call them, as many of us were taught to do before we came West, the "wet" season and the "dry" season, for we have too many winters that cannot possibly be called "wet." Possibly the "growing" season and the "arid" season would fit better, for, whether there is much rain or little, grain and garden truck does grow, if supplied with water, from October to May, while from June to September few things can be planted with hope of successful growth. Even this definition must be taken with qualifications, for there are as many different climates in California as there are counties, and there are sure to be exceptions to any rule.

If you sit down to make up a calendar for the planting of poultry greens month by month you are immediately confronted by the fact that such a calendar can be only superficial, for almost anything may be sown between October and May and very little in the other months. What you plant in January, February or March is therefore mainly a matter of taste or convenience. Only in the case of crops that must be transplanted, like kale and chard, is date of much importance, provided only you keep within the eight growing months.

Greens for hens may be grown in either of two ways; they may be grown as forage crops, each house being provided with two runs in one of which the green crop is grown while the hens run in the other, or they may be grown away from the runs and cut for the hens. While the first plan is the ideal, the second is most commonly followed, and a combination of the two is in some respects the most practical of all, for the reason that certain very desirable feeds, like alfalfa, can hardly be grown as forage crops for a large flock. For some reason alfalfa while it is the best of all green feeds does not stand the encroachments of a hungry flock of hens as well as does barley, rape or kale. In theory a thousand hens getting their living off a stand of alfalfa is beautiful and ideal. In practice it would take an immense field of alfalfa to stand up under the cropping of a thousand hens for a single month.

Of all the greens that can be grown outside the run kale, where it can be grown at all, is probably the cheapest. Professor Dryden says an acre of thousand-headed kale can be made to produce 40 tons of green forage. For winter green feed it is transplanted in July from seed sown in May or June, and for summer forage it may be planted from January on. Where irrigating water is plenty it may be transplanted any month in the year.

Kale is not as largely used in Southern California as it might be, and while there may be some localities where it will not do well, I am satisfied that in all but hottest districts it might be planted with great profit either as a forage plant or for general feeding. Hens are not as fond of it as they are of lettuce or chard, but they learn to like it, and it is rich in both protein and ash. Professor Dryden thinks an acre of kale should furnish green feed for 2500 hens the year round. When it is planted in the runs more time must be allowed for growing than is allowed barley or rape, but when it has reached a height of several feet it can hardly be killed. One setting of plants will last a year. I have kept kale growing through the summer on our dry hillside without irrigation, just an occasional sprinkling with the hose, and I believe that with irrigation it can be made to grow almost anywhere in California.

Another green plant adapted to fall and winter planting which poultrymen have not largely taken advantage of, is mustard. We are told of the virtues of mustard flour as a stimulant to egg production. What about the green mustard which now, in January, is growing wild along roadsides and on vacant lots? I always pick it for my hens as long as it is to be found, and I believe it is a valuable stimulant. I planted some mustard seed by accident with other seeds in September, and it was ready for use in November. I wish some one who has a large flock would try the experiment of planting a field to mustard in late summer or early fall, let it grow for two months and then turn his flock on it. I shall plant more this spring and then again in September.

Dwarf Essex rape is particularly well adapted for use in poultry runs because it grows rapidly and can be planted almost any month. One of my yards, about 40 feet square, planted to rape, has lasted 25 young birds several months.

(To be continued next week)

MacFarlane's Kings County Ranch
Peach trees make fine summer shade and winter's sunshine for poultry yards.

FUR BEARING RABBITS

Written for California Cultivator By Robt. V. Moore

Because of the popular use of furs and the increasing difficulty of securing skins of wild animals there is wide interest in the fur bearing rabbits. For this purpose are exceptionally adapted the German Checkered Giants, Dutch Belted, English Lops, French Silvers, New Zealand and Belgian hares, the beautiful Angoras and little Himalayas, as well as some other breeds and their hybrids. As to colors the self or solid colors are by far in the greatest demand although we think personally the spotted and parti-colored specimens are the most beautiful, and we have seen some attractive articles and designs made up of the latter.

We have also noticed that some of the hybrids and varieties have much thicker, closer and more firmly established coats of fur than others.

As to colors, one has almost an endless variety to select from; blue, black, tan, red, silver, gray and parti-colored, both with long and short coats of fur, and while some of the grades and color effects are yet in the stage of experimenting, much improvement is being noticed in some studs as time progresses.

Like all new ventures before the public at the present time many so-called breeders are quick to take advantage of this new industry to prey upon the amateur, and much misleading information and literature is being foisted by imposters upon the public. One cannot be too careful when starting to go to a reputable breeder for foundation stock as the country is being overrun with inferior stock, many of which are sold at exorbitant prices and under misnomers.

COAL OIL TO THE RESCUE

The Standard Oil Company inform us that shippers of apples and potatoes, apples particularly, have taken to the idea and are now taking ordinary cars from the railroads and equipping them with heaters. The company's main station at Tacoma, the report says, sold out its entire stock of heaters in a week to parties in the fruit packing districts of the Northwest, and still the cry is "more heaters"!

DO YOU GET BULLETINS

The Dollar Flower Garden

Written for California Cultivator By E. Braunton

THERE are many small but brilliant gardens upon which no more than one dollar each year is spent for seeds, no plant being purchased. Such gardens represent little outlay of money but much time is spent in work. Yet I know of one that is bright with blossoms every day of the year, something in bloom whenever flowers are wanted, yet but one hour each day is spent in labor and that by a woman past life's allotted span of three-score-and-ten years. Once each year a man is hired to spread fertilizer and spade it in over about three-fourths of the garden, the other fourth being then in bloom.

And now I am going to tell you the names of many fine flowering annuals that you may get for ten cents a packet or a dozen for a dollar, all of which are hardy and may be sown now. At the same time you will be given such other information as may be interesting, and if this list is kept until plants are in bloom it may be referred to with pleasure and profit. The names occur alphabetically, popular names and information follow. No cultural directions are given as none are needed. The most ordinary care will suffice. The seeds may be sown in permanent position or in beds or boxes and later transplanted, though the latter method involves much labor yet yields ideal results if time enough is spent.

Calendula officinalis is a yellow-flowered composite (Order Compositae) native to South Europe and is the "marygold" mentioned so often by Shakespeare, a very old garden flower and one that will furnish flowers when all else fails. May be planted or transplanted at any time. The best variety is called Prince of Orange.

Centaurea cyanus is another composite from South Europe, that we call corn bloom, also its German name and one of the best and deepest blues is Emperor William, but the favorite today is a double-flowered form. By the way the composite family is the one to which sunflowers, chrysanthemums, asters and daisies belong.

Clarkia elegans is native to California and either this species or the mixed sorts will please. Clarkias belong to Onagraceae, which is the evening primrose family and the godetias which will later be mentioned, also belong here and are closely related.

Coreopsis Drummondii is generally called calliopsis, but really "there haint no sech animal". It is a beautiful composite native to Texas and the best garden strain is called Golden Wave.

Coreopsis Stillmani is a showy yellow-flowering native not unlike C. lanceolata, so well known in gardens. It is especially adapted to California conditions and like a native composite flourishes without care or culture.

Delphinium hybrids are European larkspurs of stock-flowering habit and are a great and recent improvement over former kinds. The larkspur belongs to Ranunculaceae, the buttercup family.

Dimorphotheca aurantiaca is a most ponderous name for one of the finest winter-flowering annual composites ever found in South Africa, but the common name of Cape Marigold is easy enough. With its hybrids this daisy-like flower ranges in color from pale buff to deepest orange.

Eschscholtzia Californica is the proper name of our common and extremely popular California poppy which in nature has all shades of color from nearly white through yellow to reddish orange. Plant breeders have added pinks almost into magenta and also bronze-reds.

Godetias give a wide range of color and the sort desired are species and their varieties, all native to the Pacific Coast and often growing with their near-relatives, the evening primroses.

Iberis amara is the botanical name of candytuft, a native of Europe and the British Isles, belonging to cruciferae, the family containing the garden stock, mustard and all garden plants bearing a pod-like capsule as distinguished from a true pod or legume.

Linanthus densiflorus is a native of California, belonging to Polemoniacea, the phlox family and for this reason the name of California phlox has been suggested for it as the proper name is somewhat cumbersome.

Linum rubrum is popularly called scarlet flax, which it is, for it belongs to Linaceae, the flax family, though the flax of the field has small blue flowers. Our plant is one of the finest and most easily grown in the whole list.

Mentzelia Lindleyi is one of the blazing stars and belongs to a family little known to gardens or the local field Order Loasaceae. The flowers are large, often three inches across and of a shining yellow.

Nigella damascena is the name of the flower we call love-in-a-mist, but a fine named garden variety from England is known as Miss Jekyll. The species comes from South Europe and, with the larkspur, belongs to the buttercup family.

Papaver glauca is the tulip poppy native from Syria to Persia and now wild in parts of Europe and occasionally everywhere. I have seen a few plants along the water in the great Arroyo Seco in northern Los Angeles. It is deep red. The last on the list is P. rhoeas, the species from which sprung the Shirley poppies, one of the best annuals we grow. With the California poppy these plants belong to the Natural Order Papaveraceae, the great poppy family.

Anyone desiring a dozen of these sorts for a dollar, or a lesser number for ten cents per packet may send a list of the proper and the common name of each to any seedman and I believe they will be promptly sent by mail.

New Plants

Very few new plants are obtained from sports, which are decided departures from normal type in one or more characters, and there is no known method by which plants may be made to sport.

It is well for all to know that plants, like animals, are possessed of sex organs, male and female. In animal life these are always present in individuals of one sex only. This is also true of many plants. But it is also true that many single flowers bear both sexes in the one blossom. In still other plants the whole plant bears only female or male blossoms. Date palms and pepper trees are examples of this class. All plants must undergo an act of fecundation before fertile seeds are borne. This is not always necessary in lower animal life. Plant lice, or aphids, are an exception. Pollen from the male organ must be transferred to the female organ. This in nature is accomplished by insects, wind, or merely through gravity as pollen from corntassels or flowers fall on the ear silk beneath. If man wishes to produce new plants he must choose the parents and transfer pollen from one to the other, covering up the impregnated blossom to be sure no other agency outwits him. It is necessary with plants having both sexes in one flower that the male or pollen-bearing organs be removed before the blossom becomes self-fertilized. Very little study is required to readily understand the process and method necessary for control.

The Tri-State Poultry Breeders' Association is already planning for next year's poultry show at Fresno.

Dependability!

You want a sprayer that can be depended upon to work with the least possible trouble—one that isn't going to take up your time for fixing and adjusting just when you need it most. You will get day in and day out efficient and dependable service from

BEAN Power Sprayers

There are ten big distinctive features which account for Bean Spray superiority. Chief among them are:

Bean Patented Automatic Pressure Regulator

Maintains any desired pressure whether nozzles are open or closed. When nozzles are shut off the spray liquid simply runs back into the tank without being put under pressure and the engine runs free. This saves one-third of the gasoline and wear and tear on the engine and pump.

Bean Patented Threadless Ball Valves

Revolving on reversible and interchangeable brass seats; no threads to rust, corrode or stick tight; can be opened up entirely, every part removed in less than two minutes without lowering the pressure, stopping the engine or drawing the liquid out of the pump.

There are eight other big money and time-saving features that you should know about. See your nearest Bean dealer or mail coupon today.

THE SULKERS

The world's too busy now to pause
To listen to a whiner's cause.
It has no time to stop and pet
The sulker in a peevish fret
Who wails he'll neither work nor play
Because things haven't gone his way.

The world keeps plodding right along
And gives its favors, right or wrong,
To all who have the grit to work
Regardless of the fool or shirk,
The world says this to every man:
"Go out and do the best you can."

The world's too busy to implore
With any one to try once more,
'Twill help him if he wants to rise
And boost him if he gravely tries,
And shows determination grim;
But it won't stop to baby him.

The world is occupied with men
Who fall, but quickly rise again,
But those who whine because they're hit
And step aside to sulk a bit
Are doomed some day to wake and find
The world has left them far behind.
—Detroit Free Press.

HERE'S TO CALIFORNIA!

By Kathleen Norris in The American

IT was only after I came away from California, a few years ago, that I realized in my provincial heart that she does not mean to all the world what she means to us who love her, and belong to her. That there are Kentuckians, for example, and Texans, and even Europeans, who do not keenly regret the accident of birth that prevents them from claiming her smote me with a naive and puzzled surprise. Even now the very name, the very word "California," falls upon my ears with an exquisite appeal; it is like a strain of familiar and poignantly touching music. I can hear it across the noisiest tea room, or distinguish it under the murmuring darkness of the theater. The motor licenses, with the little bear guarding the number, look like friendly faces when one meets them on Eastern roadways, and when the railroad companies plaster fences with the alluring suggestion "Five Days and Seventy Dollars to California!" I feel a tug at my heart.

And Fifth Avenue vanishes, and the ever-green fields, and the panting, moist heat, and the piled snow. It is California again, with the burned hills lying like leopards under the blue, soft sky, and gulls wheeling and crying over the buoyant waters of the bay, and tar-weed and poppies tangling the alfalfa, and scenting the warm dry air. It is California, where 300 days a year are picnic days, and where the sunshine even now is falling unnoticed in golden spokes through miles of stately virgin redwoods, and where roses and daisies and heliotrope and wallflowers and stock and potted pansies and primroses, and a hundred others, are massed on the curb about Lotta's fountain, waiting for you to buy them—at ten cents or 15 cents a great armful! —and carry them home.

We are raised on superlatives, we second-generation Californians. Our fathers fought a bitter fight to reach the farthest frontier, and they loved it because they suffered for it. Whether they came "around the Horn" in sailing vessels, or across the endless prairies in the familiar hooped, dusty wagons, they learned the worth of their home before they found it. My own grandmother, with my mother at her breast, looked up through the velvet dark of night, through that same hooped covering, and watched the camp fires of hostile Indians on the hills. Ringleted, crinolined, wistful, and 18, she said good-by to the world she knew, at "Saint Joe," and left it forever behind her. To the end of her life, she liked to talk of "Southe'n" hospitality, of men who rode dashing horses and wore white, or orderly gardens packed with bloom, of cool great rooms full of silence and tree shadows, and the quiet stepping of brown-skinned maids.

Her own fate was the fate of California. She sat in the jolting wagon, beside another woman in the party, when a baby was born. She saw a priceless team of cattle fall upon an unexpected water hole and drink themselves to death. She knew one of the company, a girl, gently raised like herself, who was widowed, and who left the scalped body of her young husband behind her on the plains. And his brother took her, without benefit of clergy, because there were no clergy, and because she had young children, and needed a man.

This was after the days of the Spanish sheep ranches, and after the days of the padres. But there were Indians, and wolves, and floods in California, when they found it. She slept in a rough bed whose leg bore a notch, for which the once white and ringed hand felt often during the night. When the river waters crept up to that notch, it was time to rouse the children and climb to the roof. She climbed to the roof with the children when my grandfather was late in returning from town, too, because the noises of wolves and coyotes frightened them. She saw the gold devour men far more cruelly than the wolves, and not ten years ago her granddaughter talked to the white headed man who was laughed at, in the first rough state legislature in Benicia, because he said that wheat and fruit orchards should be planted, and would some day make the new state far more famous than did the gold. She saw the railways come, and the cities spread over the hills, and the harbor flung open as a gateway to the Orient.

San Francisco was a mere group of wooden shanties. But there must have been a glamour over it even then. The new world was so bright, said my grand-mother, the sky so blue and high, the air so gloriously intoxicating. It was wonderful to have the whole long summer go by without a single day of heavy and smothering heat; it was wonderful to have the winter mild and soft, to pick sweet peas in November, and poppies in February. Her husband farmed, mined, and became rich. She rejoiced with him when the railroad came; she took the days of the vigilante committee calmly for granted. Los Angeles was not, Sacramento was a mining camp; but there was the tiny beginning of a social set in San Francisco, and there was a convent school for girls in Marysville. She drove in her own open carriage, and entertained in her old bay-windowed house in Geary Street the homesick wives of miners when they came to the city.

After a while there were "cable cars" with "dummies" rattling up and down the hills, and the Indians vanished, and for years and years men and dusty pumps were filling in the "made land" below Montgomery Street. Prophets said that the made land would slide into the sea if there was ever another big earthquake; but the big earthquake duly came, in 1865, and the land stood firm. Other things rooted themselves, the sane and whole-

some things. Apple orchards, orange groves, wheat fields, these things came to stay.

To Be Continued Next Week.

JANUARY PRIZE CONTEST

February is the month of parties and luncheons. First comes Valentine Day on the 14th, then Washington's Birthday on the 22nd. Lincoln's birthday is also celebrated on February 12 and Longfellow's on February 27, but the first two are the ones that oftenest give occasion for parties, as custom has elaborated decorations and observances for them that make attractive entertaining easy. Especially for St. Valentine's day are dainty and charming effects possible.

If you were planning a February party or luncheon or dinner for children or young folks or oldsters what would you have to eat—since the eats are very important—how would you decorate your table and your rooms, how would you send out invitations, whom would you invite? Tell us, the Cultivator readers, for our next contest on January 27.

This is rather short notice, but often it is easier to do things on the moment than to put them off till the convenient time which is so often forgotten.

Cash Prizes

For best short article $2.00 cash will be given; for second best, $1.00. Please write on one side of paper only. For all published a three months extension of subscription to the Cultivator will be given. With your article send name and address of one to whom you wish extension credited.

CANNED CHICKEN

Many inquiries come to this office for methods of canning chicken. Here is a good one:

A four and one-half or five-pound chicken will make two tightly packed jars of meat. The fowl should be fresh and tender.

Prepare as for stewing. Leave breast in one piece. Place in deep kettle, barely cover with boiling water, cover tightly and boil from 20 to 30 minutes. Before removing from fire season with salt and pepper. Set aside to cool and then separate meat from bones, discarding skin. Keep meat in as large pieces as possible. Strain juice, place meat in it and return to fire. When mixture is thoroughly heated put into glass jars which have been sterilized as for fruit. Fill to overflowing with chicken and juice and screw covers on tightly. If perfectly sealed and kept in a cool, dry place, this will keep indefinitely.

This chicken may be used creamed, in croquettes, in salad, as the foundation for chicken pie or for sandwiches. It is delicious, extremely convenient and very easily prepared.

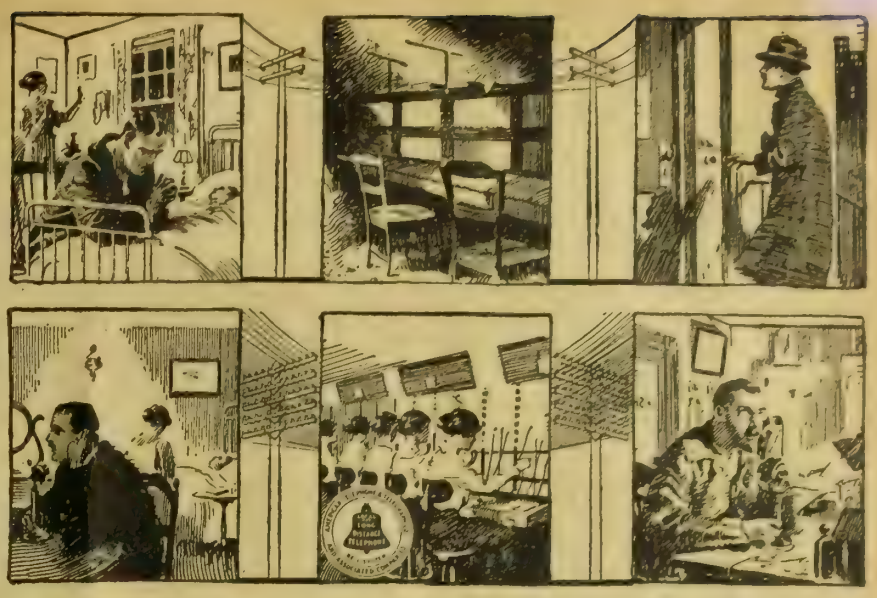
SOME GOOD CHICKEN RECIPES

Molded Chicken

Dress a chicken and cut up. Cover partly with hot water, and cook rapidly five minutes, then place on back of range and simmer slowly until tender. Cool, skin and remove fat. Chop the chicken, not too fine. Take the broth in which the chicken was boiled—there should be at least a pint of this—add to it two tablespoons of gelatine that has been dissolved in a half cup water. Bring to a boil, season to taste. Cover the bottom of a mold with slices of hard boiled eggs. Put the chicken in, and then pour over this the jelly broth. Keep in a cool place. Slice with a sharp knife.

Fried Chicken

Dress and disjoint a young chicken, roll in flour and sprinkle with salt and pepper. Place the pieces in a deep baking pan that will hold them without laying one on top of another. For chicken weighing two and a half pounds allow one pint of cream skimmed off milk that has just turned thick. Stir the cream well and then pour it over every piece of chicken. Set the pan in a hot oven, let cook until it is nicely browned, then lift the chicken out and make the gravy by pouring hot water in the pan and thickening it with a couple of tablespoons of flour previously wet up with cold water. Try this and you will find it so nice that I am sure you will never fry a chicken any other way.



Best and Cheapest Service in the World

Here are some comparisons of telephone conditions in Europe and the United States just before the war.

Here we have:	*In Europe:*
Continuous service in practically all exchanges, so that the telephone is available day and night.	Nine-tenths of the exchanges are closed at night, and in many cases, at mealtime.
A telephone to one person in ten.	Not one person in a hundred has a telephone.
3,000,000 miles of interurban or long-distance wires.	Not one-eighth as many miles in proportion to population and territory.
Prompt connections, the speed of answer in principal cities averaging about 3½ seconds.	In the principal cities, it takes more than twice as long for the operator to answer.
Lines provided to give immediate toll and long-distance service.	No such provision made. Telephone users are expected to await their turn.

As to cost, long-distance service such as we have here was not to be had in Europe, even before the war, at any price. And exchange service in Europe, despite its inferior quality, cost more in actual money than here.

Bell Service is the criterion for all the world, and the Bell organization is the most economical as well as the most efficient servant of the people.

Why not have in your garden a few **Palms**

No plants are more decorative for indoors or out. The smaller and more tender varieties "set off" interior decorations, while the larger and hardier varieties are invaluable for garden, lawn and avenue.

Palms are not expensive if bought from us. We carry a large stock in boxes, tubs and cement pots, suitable for porch decorations or planting out in the open. They are decidedly decorative, give an immediate effect, and never go back when transplanted.

Climbing and Trailing Vines, Roses, Border Plants, Etc.

Are carried by us in a wonderful assortment, comprising almost everything that you may wish for decorating either large or small grounds.

Our new 1917 Catalogue gives full details and prices; it is attractively illustrated and will be sent free upon request. Write for it.

HOGS

Smith's Poland-Chinas—Sows and gilts bred to Joker, first prize boar at Wisconsin State Fair 1915. These sows and gilts were sired by Iowa Wonder, who is a son of the great A Wonder, the most celebrated Poland-China boar living or dead. Litters from this mating are the best I have ever seen anywhere. Prices low, quality considered. Will sell one or a carload. As a special inducement each purchaser will be given a year's subscription to the American Swineherd, the best swine paper published, and a copy of the Handbook on the Sow, also a copy of the Pig Feeders' Manual. Geo. A. Smith, Corcoran, Cal.

Grape-Wild Farm Berkshires — World's Fair Grand Champion Grand Leader 2nd heads our herd, not only himself a champion but the sire of champions. At the 1916 California state fair his daughters won all of the senior sow classes including the grand champion sow. At the 1916 Oregon state fair a Grand Leader sow was junior champion. We are offering a number of choice boars of exceptional breeding and are also booking orders for fall pigs. A. B. Humphrey, Escalon, San Joaquin Co., Cal.

Make Big Money with our Big Type Poland-Chinas. Smooth, easy feeders that make greatest weight in shortest time at lowest cost, topping the market at 225 lbs. in 6 months 300 head, both sexes, all ages, reasonable prices. Best Eastern blood lines. Satisfaction guaranteed. Ranch in Tulare County, but address owner, R. H. Whitten, 610 B. Security Building, Los Angeles.

Billiken Herd of Chester Whites—The big prize winners at the 1916 California state fair. The breed that makes money for the rancher and dairyman. Have 4 nice young service boars left and 20 young open gilts that will be bred as desired by buyer. Write for the Chester White booklet that tells all about them. C. B. Cunningham, Mills, Cal.

Poland-Chinas—Twenty good gilts and three 2-year-old sows for sale. Either sired by or bred to I. B. A. Wonder, reserve champion at P.P.I.E. A few good young boars ready for service, sired by I. B. A. Wonder. A fine lot of fall pigs. I please you or refund your money. W. A. Young, Lodi, Cal.

Large Yorkshires—Choice spring boars, gilts and weaned pigs from champion sow P.P.I.E. or from breeding of champion boar and sow Sacramento, 1916. If you see them grow you will like them. Riverina Farms, Paradise Road, Modesto, Cal.

Superba World's Grand Champion Poland-China boar and one of the greatest sires of the breed. Spring boars ready for service, also few sows bred to this noted sire, reasonably cheap. Rough's Greenfields, Arlington Sta., Riverside, Cal.

50 Bred Sows and Gilts, 50—Of true Berkshire type and quality; bred to grand champion boars are included in our private sale list now ready for mailing. Write for it today. Silver Birch Farms, Box C. C., Newport, Wash.

For Sale—Panel top wagons, 3 open delivery wagons, 2 buggies. Cheap for cash or time. Arnott & Co., Wholesale Implements, 112 to 118 South Los Angeles St., Los Angeles.

DUCKS

Four Fawn and White Indian Runner Drakes, finest Eastern stock, $3.75 each. Three drakes, finest California stock, $2 each. Thirty ducks, average California stock, $1.65 each. Delivery guaranteed. Write at once. James McKee, Riverside, Cal.

PATENT ATTORNEYS

Patents that protect are secured through the PACIFIC COAST PATENT AGENCY, INC., Savings & Loan Building, Stockton, California; send for our little booklet on "PATENTS".

FARM

Oregon & California Railroad lands. Title to same revested in U. States by act of congress dated June 1916. Two million three hundred thousand acres to be opened for settlement and sale. Power site, timber and agricultural lands. Containing some of best lands left in United States. Large sectional maps showing lands and description. Price $1.00. GRANT LANDS LOCATING CO., P. O. Box 610, Portland, Oregon.

For Sale—320 acres fine sandy loam soil 5 miles northeast of Modesto, 1½ miles directly south of Riverbank in Modesto Irrigation District, average yearly water cost less than $1 per acre. Land suitable for alfalfa, grapes, deciduous fruits or farm trucking. Will sell as a whole or in 20-acre tracts. Average price $150 per acre. Will make suitable terms to parties buying for improvement. B. F. Kierulff, 757 S. Los Angeles St., Los Angeles.

I Have 80 Acres beet land near Delta, Utah, cleaned, gravity water, house, barn, domestic flowing well. On account of occupation in Los Angeles cannot look after it. Will make good terms for sale or rent to experienced farmer with outfit. Big sugar factory now building in Delta. Loading station 3 miles from land. For personal interview, address S, care Cultivator.

California Land $1.00 Per Acre Cash, balance 90c per month per acre. Immediate possession given. No taxes, no interest. Level San Joaquin Valley. Only four hours from San Francisco. Five acres up. Clear; ready to plow. Open ditch irrigation $1 acre per annum. Particulars, maps, photos, free. Stevinson Colony, Desk E, 785 Market St., San Francisco.

For Sale or Rent—80-acre ranch 7¼ miles west from Bakersfield, one-half mile from paved highway and Rosedale store. All under cultivation; good pumping plant, 140 inches water at 8-foot level; plenty buildings, telephone, good sandy loam soil. Price $150 per acre. W. F. Marks, owner, 226 South Main St., Los Angeles, Cal.

For Sale—Highly improved dairy ranch, 66 acres. New buildings, modernly equipped; best of soil; 1 mile to Merced and creamery, ¼ mile state highway. Reasons for selling. If you are in the market for something good, see this ranch. If you mean business correspond with owner for fuller description, price, terms, etc. Box 644, Merced, Cal.

46 Acres Sandy Loam soil near Tulare, unimproved, for sale on good terms, 164 acres well equipped dairy in Tulare County to trade for stock ranch in Middle West. Twenty thousand dollar income clear, to trade for orange grove or other ranch. Call on or address A. B. Sellars, Exeter, Tulare County, Cal.

What Do You Pay for potatoes, butter, eggs, bacon, ham, beans, grains, fruit and many other food products? Let me show you good California land with water at $150 per acre. Near town, school, railroad, state highway, etc. Be a producer. J. H. Dickey, 627 Citizens National Bank Building, Los Angeles, Cal.

For Sale—6-acre orange grove, near Placentia; a real snap; about 200 navels, 14-year-old; about 125 Valencias from 1 to 6-year old; one share Anaheim Union Water stock, only $6000; terms. Chas. Vogele, Placentia, Cal.

$350 Cash, $20 per month. No interest, no taxes; 4 years gives you deed to 10 acres planted to almonds, cared for by competent orchardmen. Balance can be paid from crops. E. Wiker, Arbuckle, Cal.

For Sale or Exchange, 68 acres in Tokay vineyard and grain land. House and outbuildings. Will exchange for Northern property. Write owner, C. Williams, Box 264, Acampo, Cal.

For Sale—80 acres well improved ranch, suitable for hog or dairy ranch. Will exchange for Southern California property. For particulars write owner, R. 1, Box 34, Galt, Cal.

For Sale—A fine five-acre five-year-old lemon grove in frostless Yorba Linda. Small house, five shares of water. Only $1600 per acre. Terms. Chas. E. Vogele, Placentia, Cal.

For Sale—Excellent lands, San Luis Obispo Co., $10 to $25 per acre. Inquire about them. Carl Dewlaney, Santa Margarita.

Free New Blue Booklet—State, government and Indian lands. Bargains overlooked. Joseph Clark, Sacramento.

Money to Loan on Farms, city and suburban property. C. G. Paul, 407 Chamber of Commerce Bldg., Los Angeles.

Write for List of ranches and homesteads. Low Priced Lands Company, Carmel, Cal.

TURKEYS

Bourbon Red, White Holland, Black—Bourbon and Black champions at Panama-Pacific (world's fair) San Francisco, also other first winners. Awarded three firsts Los Angeles Show last week. Eggs $5 per dozen. Turkeys in wire covered yards. Range alternately. All hardy, vigorous, choice stock. Mrs. B. Hocking, Guasti, Cal.

White Hollands, pure bred. Buy your breeding stock now. Rockwood Farm, 201 R. 6, Santa Rosa, Cal.

HORTICULTURAL PRINTING

Catalogues — Good Printing. Specialists in preparing nursery, seed, poultry and live stock catalogues and all kinds of commercial printing. For prices and information address WOLFER PRINTING CO., 115 No. Broadway, Los Angeles.

Perfect Printing Pays. We do it. Highest class work. Letter heads, folders, catalogues, etc. Write me before placing your order. G. C. Gallagher, The Service Printer, 441 Sacramento St., San Francisco.

HAY

Scott, Magner & Miller say under date of January 6:

Receipts for the past week were 1073 tons, last week 1330 tons, the week preceding, 1924 tons. The market has been easy during the week even with small receipts. Cheap grades sell to better advantage than choice owing to the fact that most of the hay arriving is of very good quality. Even though we have had fine rains cold weather has prevented grass from growing and the country demand for hay is very good. It now looks as though stocks would be practically cleaned up by the time new hay is available. This always insures good prices for new crop. Alfalfa demand is very good. Several round lots in the country districts are reported as having changed hands during the week at prevailing prices. Straw is scarce and what little arrives, sells well.

Citrus Fruit Market

LOS ANGELES, Jan. 10, 1917.

A fairly good condition obtains in practically all markets. In some of the auctions some very low sales have been made, running well under two dollars delivered, but this has been mostly injured fruit. In other markets where thoroughly good fruit has been shipped it has been picked up at good prices. Northern and Central California are cleaning up their output, having but little good fruit remaining. Both sections are using separators on injured fruit. Many Southern packing houses have also found the use of separators advisable. Shipners who have made careful investigations assert that fruit of the finest quality will go from California this year. The crop will be big and the percentage of frost damage is exceedingly small.

Lemons are picking up a bit.

Shipments

Shipments of oranges from Southern California to date since November 1, 1916, 2945 cars, lemons 820, total 3765; to same date last year, oranges 1398, lemons 1041, total 2439. From Central California to date this year, oranges 3746, lemons 117, total 3863; to same date last year, oranges 4049, lemons 87, total 4136. From Northern California to date this year, oranges 838; last year 579.

A PIONEER

E. E. McClanahan of the Pioneer Hatchery, Los Angeles, is issuing a brand new up-to-date catalog of Pioneer incubators, Pioneer brooders and various other Pioneer supplies. In fact, Mac himself is somewhat of a pioneer in the handling of poultry supplies. We do not know what the requirements are but we presume if poultry people will be kind enough to mention that they saw it in the Cultivator and ask Mr. McClanahan for one of those purple-covered, gold-lined Pioneer incubator catalogs it will be mailed pronto.

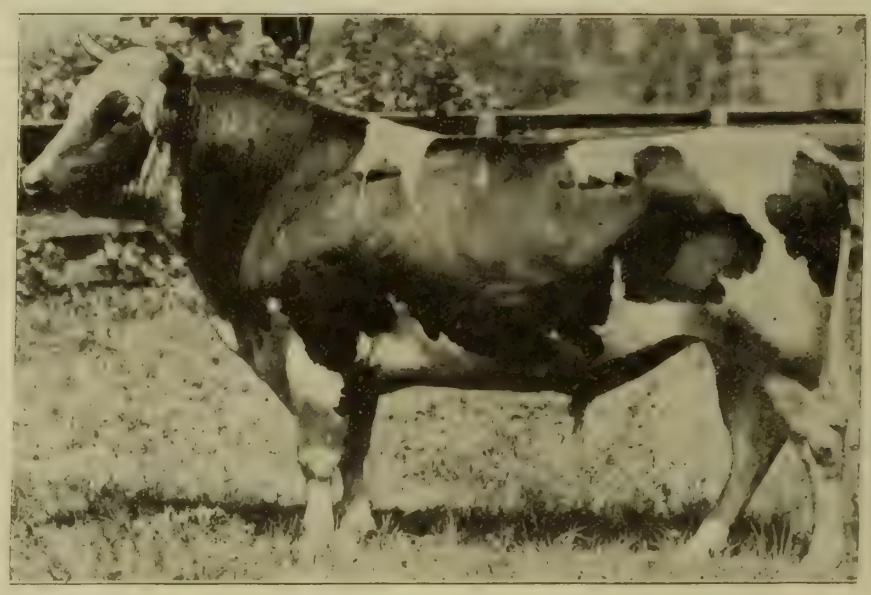
McALISTER HOLSTEINS

Headed by

King Segis De Kol Korndyke

(Senior Herd Sire)



SIRE---King Segis; Nine thirty pound daughters, and thirtyfour 30 pound granddaughters including the first and only 50 pound cow.

DAM---Pontiac Clothilde De Kol 2nd, the first cow in the world to produce 37.21 lbs butter in seven days, or 1271.1 pounds butter in one year. She is the granddam of more high priced bulls than any other cow of the breed.

JUNIOR HERD SIRES

King Korndyke Sadie Vale 27th—

The average of his three nearest dams is over 33 pounds butter in seven days, which is unexcelled by any other bull in the west.

King Winnie—

The great young son of Winnie Korndyke Cornucopia DeKol, world's champion milk cow for ten months' production, and also the only cow in the world to make over 31,000 pounds milk and 1200 pounds butter in one year.

Our herd contains 200 head of purebred Holstein Friesian cattle, including ten cows that average over 30 pounds butter in seven days, among which is the former world's champion senior three-year-old Star Rena Wayne Pieterje 2nd, who is still the only 34-pound cow of the breed with a 26-pound junior two-year-old record.
Eight heifers (officially tested) with first calf, at the average age of two and one-half years, have averaged 20.43 pounds butter in seven days which includes all that have freshened in the last seven months. None of our second-calf heifers or cows have fallen below 21 pounds butter in seven days for the last seven months. We do not believe there is another herd of Holsteins in the world which can show such consistently high production.

Females and Bulls for Sale at all Times

Write us for prices, or better still, come and visit our ranch and see the herd for yourself.
You will find an extra value in our cattle which cannot be duplicated

California Cultivator

Vol. XLVIII No. 3 LOS ANGELES: January 20, 1917 One Dollar Yearly

Pure Breds on Southern California Ranches

The Cultivator Has Given Attention to Northern and Central California Live Stock Aristocracy; Now Comes a Glance at or Partial Survey of Some of the South Counties. Every Day Sees Increase in Quantity and a Greater Increase in Quality.

By F. F. Stonerod

SINCE the days of "49" Southern California has been heralded over the world as a garden spot where flowers bloom the year round and fruits grow rapidly and mature early. That these statements are facts and not mere fiction is verified by a study of the statistics of its enormous and valuable fruit production which show it a leader of the world. But fruits and flowers are not the only commodities which this part of the state produces. Nowhere else can a wider diversification of crops be followed with profit, and most important among these crops is that of live stock, most important because animal husbandry builds for the future. It gives back to the soil all of the vitality it has taken away, and it makes for a better and more permanent agriculture. For a state that has only realized its wonderful possibilities in breeding farm animals during the past decade California has done some remarkable things, and the district lying south of the Tehachapi Mountains has made more rapid progress than any other.

There is not a breed of beef cattle, dairy cattle or swine known that is not produced there. A great many sheep are raised but the number is small in comparison with cattle and hogs. Both for draft horse and sheep breeding there are wonderful opportunities. With a rapidly growing population, exceeding a million according to 1914 census, Southern California is compelled to import the bulk of the meat it consumes, and millions of dollars are paid out annually for products which can be grown with less trouble and expense than in almost any other part of the world. That statement does not necessarily imply that a high quality of live stock is not produced there but that not enough is produced to supply the demand.

Scattered over a wide area many pure bred herds are to be found. During the past five years there have been some of the finest herds of cattle and swine assembled that could be bought. The mountain ranges and foothills are dotted with hundreds of thousands of beef cattle, putting on flesh from the rich pasture grasses, while the valleys and plains grow the dairy cow and the hog to perfection. Los Angeles is the outlet for the vast territory at her door. This market has been compelled to draw a large part of its meat and dairy supplies ffom the outside simply because production failed to keep up with consumption.

But the movement to accelerate the production of more and better live stock has been gathering impetus. If the herds and flocks are to improve the pure breds must keep pace with the number of market animals, and realizing the opportunity this part of the state has been buying high class foundation stock by the wholesale until today there are a number of individual collections which will compare favorably with the best.

As an instance of the high standard of the pure bred herds witness the accomplishments of the past year in the Holstein, Guernsey and Jersey herds. A Holstein heifer within 40 minutes' ride of Los Angeles broke the world's record for milk and butter production in her class over a six months' period. A Guernsey cow in San Diego County finished a yearly test on December 25 with a record that surpasses that of any other Guernsey cow west of the Mississippi River and places her fifth among all the Guernsey cows in the world. There are many individuals in the other dairy breeds that have made remarkable records in the production of butterfat and milk.

Probably the most noteworthy improvement in all the different phases of the live stock industry has been in beef cattle. In the old, easy-going range days the cattleman was more or less indifferent as to the class of bulls he used. Conditions are different now. Land values have increased so rapidly that the beef man must produce an earlier maturing, easier feeding class of cattle to make a profit. This is only possible by the use of the best bred bulls and more scientific feeding methods. Baby beef can be grown in Southern California to advantage, and several of the more progressive stockmen are marketing this variety steadily. We talked with one prominent beef grower recently who said he was negotiating for the purchase of a foundation herd of beef cattle for which he expected to pay as much as $1000 per head on the average. This is one illustration of the improvement of the herds, and there are many others.

Probably the most important step of all in connection with the live stock industry in the South is its recognition by the civic and commercial bodies. Just now a big live stock show to be held in Los Angeles this fall is being agitated, and there is every reason to believe that the show will be held. Why should there not be a show there? Certainly there are enough herds of show caliber in that district alone to make an exhibit that would rival the best, to say nothing of the exhibits which would come in from neighboring states. As we go to press the California State Swine Growers' Association is in session in Los Angeles. This is the first time that a state live stock organization has convened in a southern city, but the breeders recognizing that a very strong part of the association is located there and that having them make the long trip up the valley every year was an injustice, voted unanimously at Hanford to come to Los Angeles.

Gradually Southern California will command the respect of all other parts of the country which place live stock production first in importance. The erroneous idea that California can grow nothing but fruit is being rapidly dissipated. Exhibitors at the 1916 Chicago International learned that California bred live stock could make the long trip across the mountains and still win grand championship honors at the world's greatest show. Only in numbers is Southern California live stock surpassed, not in quality. With a 12-month growing period, ample rainfall, abundance of forage, and a climate that is unsurpassed, it will in time become the breeding ground of the world. Southern California thinks so and so do the Eastern breeders who have made a survey and study of its conditions.

THIS LITTLE PIG WENT TO MARKET

Perhaps she was champion of a high school agricultural club or owned by other intelligent breeder and feeder. The result was a proper mix ture in the proper degree of the proper streak of fat and streak of lean. Hence profit and comfort for the farmer's family.

THIS LITTLE PIG STAYED AT HOME

She was just as good as the first little pig, in fact a little bit better, and stayed at home to raise a family of her own, which in turn will go the way of the first little pig, with resulting greater profit.

THIS LITTLE PIG HAD PORRIDGE

No matter how good the breeding, feeding is important. In these days of high prices it takes some nerve and some intelligence to properly balance it so that greatest return is secured, but if this pig is to be a bringer of comforts into the home he must have plenty of good porridge.

THIS LITTLE PIG HAD NONE

Or perhaps he was turned on devil grass pasture and expected to rustle for himself, or possibly he was fed good and expensive corn without attention to the balancing of his ration. That is almost as disastrous as giving him no feed. He is constantly crying, "I wish I had been better bred and better fed, then I might be in the honor class with my companions."

THIS LITTLE PIG CRIED WEE! WEE! WEE!

All the way home from the state fair because he won the blue ribbons, showing his ability to produce other profit bringers, and he knows that if he does not continue crying Wee! Wee! Wee—in other words, advertising—his value will not be appreciated by others as it should be. Moral: Advertise if you would add greater value to your pure breds.

CALIFORNIA MILK PRODUCERS' ASSOCIATION

Written for California Cultivator
By S. N. Ayers

DURING recent years the farmer has awakened to the necessity of establishing for himself facilities for the marketing of his products along uniform lines that will insure to him a fair price. Farmers in the past have been more or less isolated from densely populated districts, where most of their product is consumed, and were therefore unable individually to ascertain the exact market conditions, and furthermore, were the object of speculators from the cities who endeavored to purchase their product for a nominal price and market it at an abnormal figure, making for themselves a large speculative profit. Today the farmer realizes that in order to secure the highest price obtainable for his product, and at the same time market this product so the consumer will receive the benefits therefrom, it is necessary for him to associate himself with other farmers producing a like product into what are known as cooperative associations. Usually the organization of these associations is brought about by conditions which make it unprofitable and intolerable for the producer to exist, and when this happens the farmer finds it necessary to organize as a last resort.

This was true in regard to the milk producers of Southern California, and on June 5, 1915, a body of Southern California dairymen associated them-

TALKS ON
Nitrogenous Fertilization

Number 7

WHAT is the best way to apply Sulphate of Ammonia?

Generally speaking, it may be spread the same as you would any other fertilizer material. It is sufficiently dry to apply easily and evenly by hand or machine, though for the last mentioned purpose it works better when mixed with an equal bulk of *dry* sand or earth.

SULPHATE OF AMMONIA

For CITRUS GROVES a good way is to dump several sacks of Sulphate into a tight wagon-box and drive slowly along the rows, spreading on either side with containers that hold just what each tree is to receive—say, 8 to 10 pounds.

On TRUCK CROPS it may be spread broadcast before planting or before the plants are set out.

For FIELD CROPS apply broadcast by hand or machine at time of planting or before.

From 100 to 300 pounds per acre will be found profitable.

Recorded Trees vs. Pedigreed Trees

By J. Eliot Coit

IN a recent number of the Cultivator the present writer, in answering a question in regard to lemon trees, discussed the probable value of trees propagated from buds which had been cut from trees which bore a large proportion of summer lemons. It was pointed out that such trees ought not to be offered for sale at a higher price as "so-called pedigreed trees."

The question has since been raised as to just what was meant by so-called pedigreed trees. In the first place let me say that I believe it is incorrect and improper to use the term pedigree in connection with nursery stock or other plants propagated asexually or by runners, cuttings, buds or grafts. The word pedigree is derived from the French pied-de-grue meaning foot of a crane and refers to a table or chart of ancestry showing the lines of descent converging to a common point like the toes of a crane's foot. The word was evidently coined for use in connection with animals including man. It is perfectly evident also that it is only by the union of the sexes that the lines of ancestry can converge to a common point, otherwise the lines would be parallel and not like a crane's foot. We find therefore that the fundamental idea in the use of the term pedigree is the sexual union of lines, families, and individuals whether of hogs, horses or men.

The term pedigree also implies a record which is of course the record distinguishing the individuals which make up the line. Humans distinguish the individual by a name and a place in the family genealogy. Pure bred horses and other live stock are both named and described. Often when individuals look alike, distinguishing marks are provided, such as notches in a pig's ear. This is for the purpose of preventing errors in the record of births which is kept in an official book known as a register.

In like manner plants which are propagated by seed may be provided with a pedigree by keeping records of the parentage of each successive sexual cross. Thus we may have pedigreed wheat or sugar beets. Clausen has published some very interesting pedigrees for certain of Albert Etter's strawberries which were produced by hybridization. The moment these strawberries are propagated by dividing the runners, however, the lines of descent become parallel instead of convergent, and the term pedigree no longer applies. While certain strawberries and artificially cross-bred plants may have pedigrees to start with, our citrus varieties have none whatever. Who can tell the pollen bearing parent of the Eureka lemon, the Marsh grapefruit, the Navel orange, or any other of our commercial varieties of citrus?

Go to a pet stock show and pay $500 for a Persian tom cat with a pedigree. You will get a document showing the pedigree with an affidavit as to its correctness if desired. Go to a nursery, buy 500 so-called pedigreed Lisbon lemon trees and ask for the pedigree. You will not get it for the simple reason that there isn't any. Many city people and others poorly versed in horticultural matters do not realize this. They have the more or less vague idea that if a tree is said to be pedigreed it must necessarily be very fine. This situation is often taken advantage of by the astute salesman who, quick to recognize the value of the term pedigree as a talking point, rolls the word like a sweet morsel under his tongue and gets away with it about nine times out of ten. No doubt he will keep right on "putting it across" until people learn better, which will be a long time.

The chief objection to the term "pedigreed" is that it implies more than is justifiable, and as long as the general public does not realize this it possesses unwarranted selling power. In view of this it is perhaps too much to expect that any other term will be generally adopted for quite a while at least. But this should not deter us from discussing the subject frankly in the interest of good horticulture in California.

However there is another and quite important side to this whole question. As early as 1910 at the State Fruit Growers' Citrus Convention held at Pomona the writer emphasized the fact that through the unintentional propagation of undesirable sports a gradually increasing proportion of the trees in our citrus orchards were developing into drones, worthless types, or hobo trees, and that the only way to prevent this was to use greater care in bud selection. Since that time the value of bud selection has been emphasized strongly throughout the state. This has been a good thing because it has waked up many who would otherwise have remained asleep. As a result of this the demand for high class trees propagated from carefully selected buds is growing. This is a fine thing and ought to be encouraged. Some nurserymen are making a specialty of such trees.

A friend of mine showed me some young Eurekas which were grown from fruit wood buds cut from a fine old tree whose fruit at each picking had been weighed and graded for years. It was a record-breaking tree and was undoubtedly standard Eureka throughout. I was quick to admit that these trees were certainly worth much more money to the prospective planter than the ordinary run of stock which has been the rule in the past. The reason why these trees are more valuable is because every tree is known to be a good pure-line tree and the buyer may plant them with the assurance that inasmuch as none of the buds have been ignorantly or inadvertently cut from off-type or mutating trees, that no such trees will develop in his orchard. Of course an occasional twig or limb sport may appear on any tree at any time, but if no buds are cut from it the twig sport will remain a minor and unimportant incident which may be easily corrected by pruning. The variation in the yield of the trees will be limited to fluctuations caused by individuality of root-stocks, differences in soil type, gum disease, gophers or other well understood causes.

My friend then went on to say that with each lot of trees he gave a document including affidavit if desired, giving the location and number of the tree from which the buds were taken and the detailed fruiting record of that tree for a number of years. Such a document has considerable value but it is not a pedigree. It is a certificate of propagation.

"But," said my friend, "if I am not to call these trees pedigreed trees, what shall I call them to distinguish them from the common lot?" I have therefore to suggest that the term Recorded Trees be adopted for this class of trees which will come into greater demand as the people gradually wake up to the importance of careful bud selection. They are trees for which a record has been kept both of the fruiting performance of the tree from which the buds were taken and of the propagation of each individual bud placed in the nursery.

While such trees come nearer meeting the qualifications of really first class nursery stock than any heretofore propagated, they still lack something. They are subject to unintentional mistakes on the part of honest nurserymen and deliberate misrepresentations on the part of dishonest ones. A registered animal may be described and marked in such a way that its identity is unquestionably linked with the registration certificate. Not so with trees. The word of the propagator must be accepted that the trees are actually the identical ones referred to in the certificate of propagation. Some stupid laborer may have shifted the labels or inserted a counterfeit bud where the recorded bud failed to grow or dug and delivered the wrong trees. I have therefore to make an additional suggestion which is embodied in the idea of officially sealed trees.

Suppose the county horticultural commissioner were empowered by law to place his seal on recorded trees when requested to do so, charging a small fee to cover the cost of the actual time required for his deputy to perform the service. The system might work out somewhat as follows: A nurseryman who wishes to grow a few thousand recorded and officially sealed trees to sell at an advanced

price to his most discriminating customers, would file his request with the local commissioner, stating the number of trees to be budded, the location of the parent trees decided upon, and the most convenient time to do the budding. The deputy, acting as the representative of the ultimate buyer and planter, would then arrange to meet the nurseryman at the parent tree, verify the number, approve the general condition and health of the tree, secure the performance record for filing in the horticultural commissioner's office, and personally observe the cutting of the buds. The deputy would then proceed to the nursery and observe the placing of the buds. As the buds are placed the deputy attaches to each tree a seal. The label to be furnished by the nurseryman may consist of an aluminum strip with the variety, the kind of rootstock, and the registration number of the parent tree stamped upon it. This is locked in place with a lead seal similar to the ones attached to the doors of freight cars and bearing the name of the county. At some convenient time toward the close of the first growing season the deputy returns and inspects the trees. If any trees show a second bud scar, indicating that the bud failed and had been replaced, he destroys the seal on that tree. Possibly the objection may be raised that the horticultural commissioner, unless directed by law, might neglect or forget to revisit the nursery and check up the re-buds. In view of the advantages to be gained, however, this objection has little force.

Recorded and officially sealed trees would constitute the most reliable nursery stock possible to produce. The seal would prevent error in propagation and transportation. It would enable the buyer to know without taking anyone's word for it that this particular bud was cut under the personal supervision of his representative from registered tree No. 6694 Eureka lemon located at row 4, tree 17 in John Smith's grove known as the east 20 in a certain block, section, and township. He could call at the horticultural commissioner's office and look over the fruiting record of tree No. 6694 with the owner's affidavit attached. He could verify the age of the tree by noting the record of the day the bud was cut and placed in the nursery. As long as the tree bore the seal it could pass through the avenues of trade without losing its reputation, and this would be a distinct advantage, especially in the retail nursery trade. When the trees are finally planted the seals are removed the same as any other labels. If the owner wishes to sell the orchard the fact that the trees have been recorded and sealed gives him an excellent and worthy talking point.

All the foregoing is presented merely by way of suggestion in the hope that either this plan or perhaps some other and better plan may be tried out to the end that California may lead in the production of reliable nursery stock as she does in the packing and distribution of fruit.

REDUCING COST OF FARM PRODUCTION

Believing that one way to help reduce the cost of living is to reduce the cost of production on the farm, the University of California has invited the farmers of California and all others interested to attend a "Farmers' Week" to be held at the university farm at Davis on Tuesday and Wednesday, May 20, 30 and Thursday, June 1. This three days and a half will be devoted to intensive agricultural study and farm demonstrations.

"Farmers' Week" will be so arranged that those attending may devote their whole time to a single subject or special field of farming work or may turn their attention to several different problems. There will be four or five parallel courses in such subjects as livestock, field crops, deciduous fruits, dairying and poultry. Practical demonstrations of methods will be emphasized. Visitors will be given a chance actually to try for themselves the new methods recommended and discussed in the conferences. There will be no charge for enrollment in these courses.

Fig growers of the San Joaquin Valley met in Fresno January 12 for a two days' session to discuss best methods of fig culture.

Fig Growers Convention

Large Attendance at First Gathering of the Fig Growers. Movement Launched Which Will Lead to Cooperative Marketing

AS to attendance it was not a record-breaker for fruit growers' conventions in California but it was far greater than is usually given. This convention was held in Fresno last Friday and Saturday and opened with over 500 fig growers occupying the high school auditorium. The one important accomplishment of the convention was the passing of a resolution—and unanimously—that fig growers of California proceed to organize a cooperative fig growers' association along the same lines as the Associated Raisin Company and the Peach Growers' Corporation. Chairman Clarke of the University of California was authorized to appoint a committee to proceed with the formation of a strong organization with sufficient funds for financing the marketing end of the fig industry.

The convention opened with Prof. Clarke in the chair, an address of welcome by Wylie M. Giffen of the Associated Raisin Company and addresses by many of the best informed on the California fig industry. We wish we had room for every one of the addresses made but we have this week only space for a portion of two of them. Others will appear in later issues.

THE CANNING AND PRESERVING OF FIGS

From Address By Wm. V. Cruess Before Fig Growers Recent Meeting at Fresno

IT is estimated by H. L. Kimball of the Pacific Coast Syrup Company that the fig preserving industry in California uses not more than 50 tons of fresh fruit annually. Compared with the total production of figs in the state, this figure seems very small. Perhaps some reasons why the preserving industry has not grown more is that the production of dried figs has proven profitable, the leading commercial California varieties of figs are not well suited to preserving, and the preserving of figs is rather a highly specialized industry requiring special knowledge and methods. There is need for extensive experiments, both on a laboratory and on a factory scale, because our California conditions, fig varieties, etc., are different from those of Texas, Mississippi and Louisiana, the states in which the fig preserving industry is most flourishing at the present time.

The fig is a high priced fruit and one which lends itself well to the production of high quality preserves and confections. Therefore, the production of high quality products, rather than moderate quality bulk goods should be encouraged. This means selection of the proper varieties, careful picking at the proper stage of ripeness, careful handling between orchard and factory, and careful and correct methods of manufacture.

Varieties Suited to Preserving

The preserving of figs has been experimented upon a great deal by Mr. Kimball. His conclusions are that the Smyrna, the White Adriatic and the Mission are unsuited to the production of a high class fig preserve. The Smyrna breaks up badly during cooking and has too many seeds. The Adriatic has too many seeds and the Mission is not so attractive in appearance as white figs. Of the California varieties, the White Endich and Brown Ischia have been found to be the best. They have very few seeds and after processing the outer skin remains intact and transparent so that the veins of the inner skin stand out prominently. This latter property is very important because it obviates the necessity of peeling by lye. It is claimed that the White Endich and the Kadota figs are very similar or even synonymous. Therefore, this variety should be well suited to preserving. Laboratory tests bear out this assumption.

The fig used most commonly in Texas for preserving is known there as the Magnolia fig. This, according to Professor Potts of Texas, is very similar to the Brunswick and Brown Turkey (Dalmatia) but not identical with either of these. It is a coarse fig of mediocre flavor, but peels readily by the lye process, a point strongly in its favor.

The Celeste fig was found in a can of Louisiana figs purchased in the Berkeley market. It is small, but of extremely pleasing flavor and aroma. It would not do for drying because of its small size, but seems well suited to canning whole without peeling.

According to Professor Potts, the Brunswick, Brown Turkey, White Ischia, and Brown Marseilles all do well for preserving.

For California conditions, judging by the limited data available, the Kadota, White Endich and Brown Ischia are best suited for the preserving industry. They stand up well during processing, have few seeds, pleasing flavor, color, and appearance, and become translucent or semitransparent after processing. In addition to these good qualities, it is not necessary to peel them before preserving.

Harvesting Figs for Preserving

Figs for use in making fig preserves should not be allowed to get too ripe, or they will break down too badly during cooking. If too green, an excessive amount of sugar will be needed. Professor Potts of the Texas experiment station states that the figs should be harvested just before they reach the best table quality.

The fruit should be picked without breaking or bruising the skins. This is best accomplished by using small clippers. Cloth gloves may be used to advantage to protect the figs and to protect the hands of the pickers from the action of the milk of the figs. Shallow picking trays are essential. From the picking trays the fruit is transferred to field crates which, according to a Texas grower, are eight inches deep, 12¾ inches wide and 19 inches long and equipped with cleated

HARNESS

lids to protect the fruit from the sun and to permit stacking.

The figs must be handled carefully in transit to the cannery and should be hauled only in wagons with good springs.

The figs should reach the factory as soon after picking as possible to prevent softening and molding. Mr. Kimball states that figs used in his factory are shipped in two-layer boxes by express and that it is desired that they be not longer than 24 hours on the way. He states that figs suitable for preserving often command prices of four and a half to five cents per pound, f.o.b shipping point, but that very great care must be used in picking and packing.

Preserving

The process of preserving should result in impregnating the figs with a heavy syrup in such a way that they will retain their original shape without bursting; the outer skin will be transparent, disclosing the veins of the inner skin, or the outer skin is removed by lye treatment; the whole fig will be more or less translucent; i.e., seem transparent, the flavor agreeable and the syrup clear and almost free of seeds and pulp. The California and Louisiana figs are preserved without peeling. The Magnolia fig of Texas is lye peeled before canning. Figs are put up both in glass and in cans, the best grades usually going into glass and other grades in tin.

* * *

Mr. Cruess gave several recipes for fig preserving as followed in Texas, France and other localities, as well as results of laboratory experiments at Berkeley. These will be given later in the Cultivator.

SIGN UP

We note that the greatest discouragement is felt on the part of those who would save the prune industry through the organization of a cooperative association because some of the larger and more representative growers remain outside and refuse to sign up. The smaller growers came in more freely but many of them refrain from coming in because they point to the fact that the larger growers remaining without means that the smaller growers will simply hold the sack while the outsiders will get the benefit. This is true to a degree but unless the prune growers all surrender their individuality and unite in pooling their interests great injury will be done to the entire industry. This is not so apparent in a year such as this, but another year may not show the favorable conditions which the last year has.

Touching upon this point the San Jose News says:

"A little more of this way of thinking and the whole magnificent project for the emancipation of the growers from the evils of chaotic disorganization will fail utterly. The growers who are thus blocking the advancement of their own interests and the interests of the entire valley should do more careful thinking lest they work irreparable harm on all concerned.

"Let these growers realize that by joining the preliminary organization, which must consist of 50 per cent of the total acreage, they do not irrevocably sign away their privilege of acting independently of the association, as there must still be another 25 per cent of the acreage signed up. The trustees will be elected, however, as soon as 50 per cent of the acreage is signed up.

"In other words, all that a grower really commits himself to by signing up now is the chance to vote for trustees and the chance to endeavor to get a much needed organization started. He still has the chance to block the whole movement if patently unworthy trustees are elected. And of course the trustees are not going to be unworthy men. Nobody in this movement is so foolish as to want unworthy men in office. Such men would simply put an end to the whole business, as confidence would be lost. If the growers who are holding out will only come in, they will have a voice in the selection of the trustees, and some of them may themselves be made trustees.

"A little more of the spirit of cooperation! A little more of the energy and farsightedness displayed by other communities which have formed similar organizations!"

Olive Trees

Note the root system. This is a fair sample of Roeding's True Olive Trees.

—with roots like these will give good results.

In planting Olives, as with any other fruit, it makes a wonderful difference in future profits if you start with trees that are straight, thrifty, well branched, and true to name.

Roeding's Trees Please

Our nurseries have been more closely associated with the growing of the Olive than possibly any other concern in the state. We are therefore in a position not only to supply you with the finest stock but to properly advise you as to varieties, planting, pruning, etc., and this we will gladly do free of charge.

Olives Make Excellent Border and Avenue Trees

—and they bear heavy and profitable crops. Orange orchards bordered with olives get good protection and in addition you get good returns from the olive trees. There is a wonderful future for the olive industry in California, and if you start with the right trees there should be no question about profits.

Plant Manzanillo

The Los Angeles Olive Growers' Association, in a recent letter, advise the planting of Manzanillo olives, stating that the results received from that variety exceed those from any other. As the fruit ripens earlier than other varieties, there is little danger of frost. It makes an excellent pickle and is a regular and prolific bearer.

Problems and Opportunities in the Fig Industry

From an Address by Prof. J. Eliot Coit at the Fresno Fig Growers' Meeting.

THE fig industry in California has progressed by several well marked stages or epochs. The first of these consist of the period of about a hundred years when the Black Mission fig distributed from the missions was the only fig grown in the state. The second stage includes the years from 1850 to 1900 during which time scores of varieties were introduced both from Eastern nurserymen and from the Old World. Among the men most active in this phase of development were Felix Gillet, W. B. West, John Rock, S. N. Wilco, G. P. Rixford, George Roeding and others. Out of the great mass of varieties thus introduced the Mission and Adriatic remained the best for commercial drying.

The third epoch began about 1900 when, after much experimenting and repeated failures, the culture of the Smyrna fig was finally made a success in California. The bulk of the dried figs of best quality in the world's markets had always come from Smyrna and consisted of the Smyrna type of figs. The successful production of this class of figs in California was therefore hailed as a great advance which gave California an opportunity to compete with Smyrna for the markets in this country and perhaps those of other countries as well. It took some time for the culture of Smyrna figs to become anything like general and would no doubt have taken longer but for the fine example and demonstration afforded by Mr. Geo. Roeding's large Calimyrna fig orchard.

The general increased interest in fig culture began about 1912 before there was any idea of a European war. Rather extensive acreage had been planted when the war began. The entrance of Turkey into the war and the blockade of the Port of Smyrna stopped all importations of Smyrna figs into this country and greatly reduced the amount of figs available for American markets. Before the war the United States usually imported about 10,000 tons of dried figs valued at the port of export at about one million dollars. Three-fourths of these came from Smyrna and the other fourth from Spain, Portugal, Greece, and a few from Italy. The British blockade did not include Turkish ports or interfere with fig shipments until 1916 when they were cut off entirely. We have secured some extra figs this year from Portugal and a few from Greece but the total importations from all sources amounted to only 3576 tons coming mostly from Greece and Portugal. We are therefore largely limited to our own fig crop, the size of which we do not know accurately, but which probably amounts at present to between six and seven thousand tons with prospects of large increases in the near future when recently planted areas come into bearing. It is pretty clear therefore that most of our Eastern friends will have to eat California figs this year or go without. I therefore wish to call your attention to the positively unique opportunity which is thus presented to the California fig industry—the opportunity of weaning our Eastern friends away from the Turkish product and impressing them with the fact that we are producing some first class figs now and will soon be producing all the country can consume. Are we going to take advantage of this wonderful opportunity or are we to let it pass? I know the price of figs is high this year and many of you have made money. The demand has been such that buyers have taken pretty much everything that even smelled like figs at good prices. I know the temptation to put everything in, but judging from some of the packs that are going out this year I am afraid that when the war is over our Eastern friends will give a sigh of relief and say "Thank goodness that's over; now we can get good imported Smyrna figs again. It's fierce to have to eat that California stuff."

It is too bad we haven't a larger proportion of Smyrna figs with which to cultivate the Eastern market, for I doubt whether we can permanently displace the imported Smyrna with Adriatics, especially when many of them are sunburned and tough. Some of you may take the position that the Adriatic is the fig to plant because there is apparently more profit in it at the present time. This I believe is a very short sighted policy because there is no question that the Smyrna makes a much better dried fig than the Adriatic.

While I am intensely anxious that something be done toward educating the market to the best grades of California figs, no one realizes better than I that the industry, though very prosperous, is not in a position to make the most of this wonderful opportunity. The industry lacks two essentials for the greatest success. I refer to organized cooperation and standardization of product. It is impossible to properly advertise the product without cooperation and it is useless to advertise a product which is not standardized. We know this to be true from the experiences of other fruit organizations such as those of the rasin growers, walnut growers, citrus growers and others. I have been told by those who have made a special study of agricultural cooperation that it is next to impossible to get a group of farmers to organize in their own interests unless they are in sore distress. As long as they are getting good prices for their product and are fairly prosperous I am told they will not bestir themselves to organize but will be content to follow the old methods of getting an advance on the crop in the spring and turning the crop over to the buyer at his own price in the fall, oblivious to any unprecedented opportunity which may present itself to the industry as a whole. I sincerely hope that the fig growers of California may prove themselves a signal exception to this rather broad generalization. At any rate I am resolved not to let this opportunity pass of calling your attention to the tremendous possibilities involved in the use of cooperative sulphuring and packing houses and standardized well advertised brands. In California we can produce a Smyrna fig which is the equal of the imported product in every way. So far but few have learned to pack the product as well as the Turks, but there is no reason why we may not all soon learn that trick. California ought to produce all the dried figs consumed in the United States and Canada and advertise them in such a way as to increase the consumption to several times the present rate. In our present unorganized condition we have no way of even knowing how many figs are produced. Estimates on the size of the California crop are the wildest guesses. Consider what the raisin growers have done. Fresno has come to be known the world over as the Raisin City. Why may not this record be duplicated with figs?

FERTILIZATION IN SOLANO

Touching upon the work of fertilization in Solano County fields, Farm Adviser Mills reports to the board of supervisors:

There are at the present time in Solano County practically no orchards being fertilized excepting a small area on which home made stable manure is being used. This office has now under way demonstrations in seven different orchards, including Suisun and Vaca Valley. These include old orchards and those just coming into bearing. As it takes two or three years to make a practical demonstration and much time and patient record keeping to get accurate data, the grower fails to get anywhere in the work. With the completion of this work, the growers will have definite knowledge as to how and what to do to increase the productiveness of their orchards.

Liming experiments on the grain lands near Rio Vista and Vallejo have been started, it having been discovered by this office that some of the fields even on the tops of the hills in the vicinity of Benicia and Vallejo have an acid soil which accounts in part at least for the light yield of grain and hay in those particular fields.

Apricots

Now is the Time to Plant Apricot Trees

There is money to be made in planting Apricot Trees, for the fruit, either green or dried, is always in demand.

The yearly consumption of Apricots equals production and this means good prices.

Our trees grow rapidly and produce heavy crops early.

Royal Blenheim and Tilton

These are the Three Big Leaders

We have these three varieties on either Peach or Apricot Root.

Our trees give a perfect root system because they are grown on silt-wash soil and the buds are selected from best bearing orchards.

Send for Free Illustrated Catalogue and Price List of Apricot and other trees, Vines and Shrubbery.

Address Dept. "A".

THE FRESNO NURSERY CO. INC.
FRESNO, CAL. P.O. BOX 615.

Fertilizer experiments on the adobe lands near Rio Vista are being carried on to determine if the yields of wheat can be profitably increased by this method. New forage crops for the marsh lands are being introduced and tried. Fertilizer and lime demonstrations on the marsh lands are under way to determine if certain deficiencies in grain production can be corrected.

MODERN FRUIT MARKETING

Modern Fruit Marketing, a complete treatise covering the harvesting, packing, storing, transporting and selling of fruit, by Bliss S. Brown, professor of horticulture, University of Maine, published by Orange-Judd Company, New York. Net price $1.25.

We take a bit of exception to one word on title page of this book, that is, "complete." As noted, the author is professor of horticulture of the University of Maine, which from this corner of the earth appears to be at one extreme of fruit producing sections. Notwithstanding that, Prof. Brown has gathered a great fund of information which is made plain by hundreds of illustrations. There are illustrations on almost every page and various methods of fruit harvesting, preparing of fruit for the market, fruit packages, fruit packing operations, fruit storage, the effect of storage on fruit, transportation, markets, selling agencies, selling methods, special fruit organizations and fruit shows are touched upon.

Quoting the first paragraph of the introduction:

"Agriculture is the science, the art and the technique of supplying human wants from the products of the soil. This does not exactly correspond with the old definition but is a readjustment to meet the needs of its modern application. The Latin "agri," meaning field, and "horti," garden, have long since outgrown their usefulness as a definition for present-day agriculture or horticulture. The tendency now is to increase the scope of the word agriculture to include the art, science, and the technique of everything pertaining to farm products, and to delimit the meaning of horticulture within narrower and narrower bounds."

"HOME AND FARM CANNING"

Circular No. 158, "Home and Farm Canning," is issued by the agricultural experiment station, University of California. It is written by Prof. W. V. Cruess for the purpose of answering the many questions which are continually coming regarding home canning. There is discussion of methods of preserving, of sterilization, the use of preservatives, general equipment, soldering, tinning, syrups, special directions for various fruits and special directions for various vegetables. It is an invaluable publication for the home canner.

SUGAR BEET SEED

Sugar beet seed was grown commercially in this country during the past year in several states from Michigan to California. The crop of seed harvested in 1915 was so satisfactory, according to the report of the chief of the bureau of plant industry of the department, in each of the areas tested that a largely increased acreage was planted this year.

This bureau has assisted in an advisory way in growing, selecting and siloing the roots, planting them in the spring, harvesting and cleaning the seed, and, in general endeavored to produce the largest amount of commercial seed possible at a minimum cost. Approximately 5,000 acres are in beet seed in this country this year, while we require the product of at least 16,000 acres for a normal planting, not considering the natural expansion of the beet sugar industry. Each new mill will require an average of 200 acres in seed to meet its planting requirements. Seven new mills are in process of construction for this year.

The problem of drying the sugar beets for the purpose of increasing the amount of raw material for the mill and thereby increasing the length of the sugar campaign has been further investigated. The principal difficulty has been in finding or devising a dryer of suitable capacity to handle enough beets per day to be profitable.

Worn Out Soils Made Productive
by using
Hauser's Organic Fertilizers
Science and practice both indicate that Nitrogen and Phosphoric Acid are necessary to produce the best results from the Citrus Orchards, and these two essentials are most prominent in organic fertilizer. Hauser's Organic Fertilizer is a concentrated soil builder and fruit producer. Put back into the soil at least a portion of the natural elements the orchard has taken out.

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertiser in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

THIS WEEK'S COVER

It has been said of California that it is rather green and raw as yet; that it does not show the finished appearance of the Eastern states; its farms are yet in the making. Perhaps we must admit the general truth of this, but look at the cover page of this issue and it may be seen that some of our farms have a reasonably finished look while they are in the making. This view is of Hollow Hill Farm in San Bernardino County. There are hundreds of Guernsey dairy cattle and Berkshire hogs. Every feature of the ranch is up-to-date, and as to sanitation and conditions which enable the production of the very finest of dairy products, we may say it is a certified dairy and one of the best. As to type of dairy animals on this and other Southern California ranches other columns of this issue give information.

PROOF OF THE PUDDING

Another proof of the value of cooperation is shown in the article in this issue by S. N. Ayers, secretary and manager of the California Dairyman's Association. Dairymen supplying the city of Los Angeles with milk did not wait as did those of New York until it became necessary to go on strike and boycott and even dump thousands of gallons of milk into the gutter, but by more reasonable and lawful methods began some years ago to organize and in a quiet way insist on fair treatment. This association has grown and has saved the dairy industry and made it bring reasonable return to the producers. The association works both ways, that is, it markets products of the dairy and purchases supplies so as to reduce the cost of production to the minimum. For example, at this moment, and owing to contracts made with alfalfa producers months ago, the association membership is securing alfalfa about four dollars under present quotations. Nothing succeeds like success, and so long as successful buying and selling prevails cooperative organizations will grow. Regarding this matter of cost of production we will have more from Mr. Ayers in a later issue.

SWINE BREEDERS

As we go to press swine growers about Los Angeles are planning for a royal good meeting of the state swine breeders' association. Only one day will be given to discussion of swine matters of the state, that is formal discussion in the assembly chamber. Friday is to be given over to visiting packing houses.

One swine breeder has suggested that this will be a packers' convention. We do not think there is any occasion to worry over the packers running away with this convention. They are extending cordial welcome and every packer will hold open house during the next few days. Nothing is gained by those interested in any one calling combating others interested along the same line. Cooperate; be sure that you give a fair deal; make sure that the other fellow gives a fair deal. We believe through a more general understanding between producers and packers this may be accomplished. We think this convention now in session will be a long step in that direction. The producers will demand the same treatment that is given to Eastern producers; it is only fair that they should have it.

PARKER EARLE

Parker Earle, former president of the American Pomological Society, life long fruit grower and tireless investigator, died at his home in Pasadena on January 12. Probably no one in America today has accomplished more for American fruit interests than Parker Earle. For half a century he

Parker Earle

Mr. Earle is the man with the overcoat. This picture was taken of Mr. Earle for the Cultivator when he was on his way to attend the 1914 California State Fruit Growers' Convention when it was held in Los Angeles.

was a leader in horticultural matters. Mr. Earle was born in Vermont, was a fruit grower in Illinois, supplying some of the finest markets in Chicago. He later went to Mississippi and from there to New Mexico, and after years of activity in that section he came to California, where for the past six years he has lived. In 1915 when the members of the American Pomological Society visited the state, holding sessions in Berkeley, a trip was made to Pasadena, and at a luncheon at the Hotel Maryland a reception was tendered to Mr. Earle. His life has been a busy one and notwithstanding his 85 years even the most recent horticultural events have held his keenest interest.

STOCKYARDS

Questions of vital interest to the swine growers of this state will be discussed at this week's annual convention of the breeders in Los Angeles. Possibly the question of public stockyards in both San Francisco and Los Angeles will be brought up. Regardless of how much time and effort are expended toward closer organization, cooperative marketing, "finish" of market animals, etc., they will not bring about any permanent good until the shippers have the same marketing advantages here that they enjoy in all other parts of the United States where live stock is produced in large numbers.

Under existing conditions in California more than 90 per cent of the meat animals sent to the markets pass through the hands of the country buyer before being transported to market. This buyer exacts his pound of flesh which runs from one to two cents per pound according to his ability to buy at a close or wide margin. The usual charge for feeding, watering and selling a carload of hogs at a public stockyards is $15, but a mere fraction of the scalper's commission. This one feature alone means a saving to the grower of thousands of dollars annually. Other advantages of a public stockyards are; open competitive bidding by the killers, opportunity for the shipper to compare his product with that of his fellow shippers, and more stable and higher prices.

When the Eastern farmer receives his market paper in the morning he glances at the range of prices and knows for a certainty what he can receive for his hogs, cattle or sheep at any one of a half dozen markets. In California he is always in the dark as to prices. So long as there are no stockyards or live stock exchange there will be no satisfaction or correct quotations.

Modern stockyards are by no means free from criticism, but they are far better than none. Eastern farmers who come to California to live note the difference between markets here and there, not alone from a price standpoint, but in our obsolete methods of marketing.

It is claimed by some that there are not enough good hogs or other stock grown here to warrant any higher prices than are being paid. Producers of real hard grain finished stock will say that they rarely get a better price for their product than the fellow who ships alfalfa or milk hogs. In any event the condition must be improved if stock raising in California is to flourish and endure.

LIVE STOCK INCREASING

In speaking of the poultry industry in a recent number we referred to the fact that in 1914 Los Angeles imported 158 carloads of poultry products. The next year it was 55 and a like reduction continued until now we are shipping carloads of eggs to New York where the price of living is high.

Possibly similar figures might be given as to dairy products and the animal industry in general, but we have not figures which are very accurate. Furthermore, no one has, for the industry is increasing with leaps and bounds. We might refer to the growth of one county of the southern part of the state, which reflects the growth of the producing section, and call attention to the fact that in 1906 its assessed valuation was $226,000,000. In 1916 it was $991,000,000, or practically a billion dollars. But what is a billion dollars? In fact, what do figures mean to us as a rule? Hence we are going to come back to something concrete and tangible, that is the California Cultivator. If you wish to know regarding the animal industry of Southern California watch these columns. For example, this one issue is a practical survey of the southern counties. It is the biggest issue the Cultivator has ever taken from the press, and in its illustrations and in the text is more proof of the growth of the live stock and other affiliating interests than we can give in any other way.

And the best of it is that with this increase there is increase in quantity and profitableness of the fruit industry as well. A live stock country is a rich country and in California live stock will make for richer orchards and a richer state generally.

To secure this survey of live stock in Southern California F. F. Stonerod in his little Cultivator Ford has traveled over valley and mountain. Even the Ford has been stalled several times, but Stonerod never; he has rambled on, and through the assistance of almost every stockman approached has gathered information as to stock interests which will surprise many.

To all who have aided we express heartiest appreciation.

Agricultural Notes

Over 10,000 acres of denuded lands in the national forests were replanted in 1916 with more than 6,000,000 trees.

The United States department of justice has appointed G. W. Anderson, United States district attorney at Boston to take charge of the investigation of the high cost of food.

In 1904 the actual cash road and bridge expenditure in the United States averaged slightly less than $28 per mile of rural roads. In 1915 the cash road and bridge expenditure had increased to an average of $109 per mile of road.

Because of the shortage of labor, Russian agriculture is feeling even more keenly the necessity for improved agricultural machinery. The department of agriculture has recently appealed to the Duma for appropriations for the purchase of American agricultural implements.

The "Better Farming Special," a train equipped as a demonstration school in New Brunswick, will the coming summer much enlarge its field of usefulness by making stops of several days' duration in various districts, instead of the short stops and lectures, as heretofore.

The big prices now being paid for cotton seed at the mills is inducing many planters to sell down so close that there is now fear lest the supply of pure seed for next season's planting fall short. The department of agriculture is therefore sending out letters warning growers to look ahead.

In an effort to reduce the high cost of potatoes, the department of agriculture has ordered a relaxation of the quarantine against potatoes from Canada. Canadian potatoes with not more than ten per cent showing traces of disease will be admitted at any border custom house, instead of specially designated ports, as has been the practice.

Portuguese dried figs have found a growing market in the United States, this year's imports being about 6000 tons, five times the imports of 1915. The United States is about the only market still open to these figs, the greater part of which were shipped in former years to Germany and Russia, via Holland.

Premier honors for butter were won at the last National Dairy Show, Springfield, Massachusetts, by the creamery at Grove City, Pennsylvania, operated under the supervision and direction of the dairy division of the Bureau of Animal Industry. Twenty-seven states and the Dominion of Canada were represented in the 151 samples entered.

An interesting statement appears in a report of the Jewish Agricultural and Industrial Aid Society: "Advice to prospective farmers—The society carries on no 'back to the land' propaganda. On the contrary, it finds that its greatest task is to prevent those who are unfit from embarking on a venture for which they are ill prepared and in which their chances of success are extremely remote."

It costs $128 per year to board a hired hand, according to estimates furnished to the department of agriculture by 1000 farmers representing widely separated sections in 14 states. It was found that the total annual cost per person of board for hired help varied from $104 in Vermont and Pennsylvania to $162 in New Jersey and that the percentage of this cost paid out in cash varied from 15 per cent in North Carolina to 49 per cent in California.

Agricultural News Notes of the Pacific Coast

Northern California

A 1200-acre tract will be planted to alfalfa near Orland, Glenn County.

Penn Valley, Nevada County, has formed a local of the county farm bureau.

Corning, Tehama County, has a return of a quarter of a million dollars for its output of pickled olives.

The Bridgeford ranch of Contra Costa is receiving a number of exceptionally fine pure bred Holsteins.

A new irrigation district has been formed along Long Valley Creek. It contains 34,000 acres of Lassen County's richest land.

The continued cold weather has aroused some apprehension in cattle feeders who have stock on the hills of the Coast Range.

Report of tester of the Gridley Cow Testing Association for the month of December showed 13 cows testing over 40 pounds of butterfat.

The Anderson-Cottonwood Irrigation District is contemplating the issuance of bonds for $300,000 for the completion of its irrigation system.

The Yolo Water & Power Company, which served water to 9000 acres of rice last season, is preparing to put water on 20,000 acres this coming season.

A sale of more than 50,000,000 feet of pine saw timber was recently made in the Lassen national forest near Susanville. Cutting will begin next summer.

N. P. Searles, Yolo County farm adviser, has arranged for a series of meetings to illustrate methods of pruning. A. H. Hendrickson of Berkeley and F. Flossfeder from the state farm, Davis, will have charge of the demonstrations under the direction of the county farm bureau.

The Hayward Poultry Producers' Association at its annual electon, held December 4, selected the following officers: President C. C. Wright; vice president, J. A. Due; secretary, T. J. Taylor; treasurer; J. M. Bickell; other directors, N. H. Jensen, W. C. Wallace and L. F. Gottborg.

Central California

A cow testing association has been organized at Corcoran. One thousand cows will be tested.

Citrus growers of Central California are finding that frost injury is less serious than first estimated.

Returns from the early orange shipments from Lindsay are reported to have been very satisfactory.

Modesto, Stanislaus County, is anticipating the establishment there of a $30,000 milk sugar factory.

Nearly 25,000 acres will be planted to sugar beets for the Visalia and Corcoran sugar factories this year.

Within the past few months Kings County has completed more than 45 miles of paved county highway.

Horticultural Commissioner Howard of Kings County is issuing a bulletin giving tree planting information.

The newly organized farm bureau at Ceres, Stanislaus County, held a meeting for election of officers January 13.

The Lindsay-Strathmore Irrigation District has applied to the state water commission for 10,000-acre feet from the flood waters of the Kaweah and 8000-acre feet from the flood waters of the Tule.

The Santa Fe railroad is taking up a new plan of advertising California in the East. Instead of trying to describe conditions in all sections of the state a few successful instances will be picked out for special emphasis.

The federal department of agriculture has delegated R. L. Nougaret, entomologist of the bureau of entomology, to work in connection with Fresno fruit growers, his special work being on phylloxera. Commissioner Roullard has worked to this end for some time.

An educational campaign will be made in Kings, Tulare and Fresno Counties to make known to property owners the plan to construct a great reservoir at Pine Flat to store 600,000 acre-feet of water for the irrigation of more than 1,000,000 acres of land in those three counties.

Southern California

Calipatria is becoming a large shipper of eggs and poultry.

There are rumors of the establishing of a new oil mill in Imperial.

Hemet Valley claims the biggest grain crop in the valley's history.

Sugar beet growers are pleased over the December and January rains.

Elsinore, Riverside County, contemplates more general planting of sugar beets.

Orange County growers of chile peppers are pleased with the advancing prices.

Farmers along the Santa Ana River are planning more complete flood water protection.

El Cajon Valley peach growers are organizing to secure better returns and aid in standardizing their pack.

A proposition has been made to build a sugar factory at Riverside, providing 10,000 acres of sugar beets will be grown.

Right of way has been secured through the national reserves surrounding the Sespe hot springs in Ventura County.

Big additions are planned to the factory of the Anaheim Sugar Company. The output of the plant will be increased to 1200 tons daily.

It is reported that within the past five weeks 100 apricot growers of the Hemet Valley have signed contracts with the apricot association.

The Southern California Auto Club has compiled tables showing 10,013 miles of paved highways have been built by the state and counties.

The Ranchers' Market of the El Cajon Valley is planning to have 750 acres of its members planted to cabbage, cauliflower, tomatoes, potatoes and other vegetables.

The public market committee of the Riverside chamber of commerce arranged for a farmers' and gardeners' institute, held in Riverside yesterday and today. Prof. S. S. Rogers from the university farm school at Davis was present to address the boys.

The Coast

Mutton prices are being broken in Portland; good valley lambs selling for $10.50.

The second annual Dairy Products Show will be held at Portland the last week in February.

Some cow testing associations in Idaho maintain that a 300-pound cow should be the minimum.

Miss Lillian D. Clark of the California University is aiding in university extension work in Arizona.

Montana Angora breeders anticipate 40-cent Mohair next season. Sales have been made this year at 34 cents.

The annual convention of the Idaho State Horticultural Association will be held at Boise January 30-February 1.

Several Yakima hop growers have decided to plant sugar beets instead of hops next year because of low prices of hops.

The second month of the All-Northwest Laying Contest at Pullman, Washington, shows a pen of White Leghorns belonging to a Corvallis breeder in first place.

Snohomish County, Washington, commissioners will prosecute loggers who use the new paved roads for their logging operations. Hard surfaced highways and motor trucks make log ging easy, but there is a state law prohibiting the hauling of loads that will injure or destroy these roads.

The Northwestern division of the Farmers' Union, at its recent annual convention in Spokane, elected J. V. McCall of Hay, Washington, president, and A. D. Cross of St. Andrews, Washington, secretary. The executive committee is made up of members from Idaho, Washington and Oregon.

The Idaho State Seed Growers' Association held a convention January 8-17 at Pocatello. At the same time and place there were conventions of the Idaho State Dairy Association, the State Swine Breeders' Association, the State Live Stock Association and the State Cattle and Horse Breeders' Association.

These Are Right Tools

WHAT you do for your seed beds before the crops go in has so much to do with the yield and quality you reap at harvest time that it pays to go slow and **be right in choosing your tillage implements.** That is why farmers everywhere—your neighbors among them—are using International Harvester disk harrows, peg and spring-tooth harrows, cultivators, etc.

At your I H C dealer's store is your opportunity to find out about these. There you will find disk harrows with rigid lasting steel frames, with gangs made to be level at all cutting angles, bearings with four wears, built correctly as to adjustments, seat and levers. You'll find double harrow attachments, forecarriages, transports, everything to just suit you and your fields, even though they be hilly, stony or of any sort of unusual soil.

Take note of what has made the peg and spring-tooth harrows popular with men who want crops as big as they can be made. Pegs that never wear loose. Oil-tempered spring teeth fastened on steel pipe bars to stay. Runner teeth and transports, easy-set levers, riding sulkies, etc.

Be careful in buying tillage tools and be sure to study the International Harvester line. We have catalogues that will interest you.

Practical Hints for Concrete Construction

During the course of an illustrated lecture relating to concrete construction on the farm, the speaker, who had traveled throughout all the important agricultural districts east of the Mississippi taking notes and photographs of various examples of concrete construction on hundreds of farms, was asked what proportion of farm work of this character resulted in failure. He replied that failures were exceedingly few, and that if farmers were instructed as to the use of proper aggregates, failures would become practically unknown.

The following brief instructions concerning the essentials of good concrete have been prepared for the information of farmers, who will find them convenient as reference data. If strictly observed they will insure satisfactory results.

Aggregates to Be Used in Concrete Construction.

The sand, stone, and gravel usually found upon the farms of the United States are generally suitable for concrete construction, provided the following precautions are taken:

These aggregates must be free from vegetable matter, dirt, or other foreign substances.

When using bank-run gravel, the sand must be separated from the stone or pebbles by screening through a ¼-inch screen.

In small concrete structures, such as drain tile, fence posts, etc., the coarse aggregate (crushed rock or gravel) should range in size from ½ inch to ¼ inch. For larger work, such as silos, barn floors, ordinary foundations, etc., coarse aggregate should range from 1½ inches to ¼ inch.

The sand used should be coarse, hard, and clean, and graded from ¼ inch to fine, with the larger size predominating. Use great care in hand mixing. It is economical to buy a small machine mixer if the farmer intends to use concrete in large quantities.

Hand Mixing.

Proper methods when concrete is mixed by hand, using a two-bag batch of 1:2:4 proportions, are as follows: The size of measuring box for sand should be two feet square by one foot high, thus containing four cubic feet.

Concrete Makes Permanent and Best of Watering Troughs

Load sand in wheelbarrows and wheel onto mixing board.

Fill sand-measuring box, lift box, and spread sand four inches thick over board.

Take two bags of cement, place contents as evenly as possible over sand.

Turn the sand and cement over until thoroughly mixed, so that no streaks of cement or sand appear.

Spread the mixture of sand and cement out carefully, place measuring box beside it, and fill twice with stone or gravel, then empty onto sand and cement mixture and mix thoroughly.

Add three-quarters of required amount of water slowly and evenly, at same time mixing the mass.

Continue mixing, adding balance of water when dry spots appear, until whole mass has been turned over three or four times. This should be sufficient. After final turning shovel into compact mass ready for wheeling to place.

Questions and Answers

ANSWERS BY EDITOR AND STAFF

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Feeding Milo to Turkeys.

Do you find the use of milo safe in feeding young turkeys? I have read many times that Indian corn will kill the young poults and had supposed milo would do the same until I have seen a number of neighbors feed it with apparent success. What is the experience of experts?—Subscriber, Brawley.

The opinion of experts changes from year to year, for we have not yet found any method of feeding young turkeys which can be guaranteed to bring them through the trying first three months, but the latest opinion of the Rhode Island experiment station, which has done more careful investigating than any other station or person, is that what you feed young turkeys is not half as important as how much. Many turkey raisers do succeed with corn, many succeed with milo, and wheat and even barley, though barley because of its hulls is not recommended. The main thing is to feed only what they will eat greedily and to make any change very gradually. Of course no whole grain can be given until the poults are old enough to eat it, which is usually from two to three months of age, depending largely on what their previous feeding has been. —J. A. K.

Grain Sorghums

Please advise which of the following grains would have the most fattening qualities for poultry: milo, kafir or feterita.—Subscriber, Long Beach.

There is practically no difference in the feeds mentioned. In fat formers dura shows slightly greater content of fat; 2.7 as against 2.5 for feterita, 2.2 for milo and 2.3 for kafir. The protein content is also very similar.

Denatured Alcohol

Please give information regarding the manufacture of denatured alcohol, what it costs to fit up a small plant, what are the laws regulating manufac-

ture, etc.?—Subscriber, Yorba Linda.

When the present law was enacted some eight years ago it was felt that a great opening had been made for the disposal of many of our waste products and at a fair profit. Immediately a very complete treatise, or practical guide, "Introduction to Distillation" was published by the Munn Company of New York. This is a four dollar book of over 500 pages which gives the most practical information of methods of manufacture. The United States department of agriculture has also issued some bulletins which we presume may be had for the asking. To give methods or to go into it at any length would require more space than is available in the Cultivator. We may add that the law was so involved and its regulations so strict, and this, with federal oversight and fees demanded makes expense of manufacture so great that the small plant will probably never succeed until there is a revision of the federal law.

Septic Tank Fertilizer

What is the value of septic tank fertilizer?

We are unable to give any information as to solid matter from septic tanks, but as to sewage, Voorhees "Fertilizers" says: "There is now a product called 'sewage sludge', which is obtained in many towns, as a result of its chemical treatment. Such examinations as have been made of this product show it to be very poor in fertilizing constituents, showing less than .20 per cent nitrogen, .05 per cent phosphoric acid and .05 potash. It is seldom worth the handling. The untreated sewage and garbage wastes are also obtainable in large quantities, and while the constituents contained in them act quickly, and while they are considerably richer in these than the sludge wastes, it seldom pays the farmer to handle them, owing to their offensive character and the enormous amount of useless moisture contained in them". In any case there is such variation in constituents that analysis would probably be necessary to determine even approximate values.

Slow Butter in Winter

Please let me know how I can make butter with less trouble in winter. It takes me a long time. I churn twice a week about three gallons of cream which I keep about 65 degrees Fahrenheit at churning. Feed beet pulp with alfalfa meal and alfalfa hay to the two cows.—Susbcriber, Sacramento.

This question was referred to E. H. Hageman, creamery manager at Newman, Stanislaus County, who answers:

The difficulty your subscriber has in churning can invariably be traced to the ripening process of the cream. Cream should have a mild acid flavor and be ripened to a thick consistency just before churning at 58 to 65 degrees Fahrenheit. The cream should test about 35 degrees butterfat, or rich enough to make from three to three and one half pounds of butter per gallon of cream. Cream, in cold weather or winter time, allowed to stand and ripen in the natural way without a starter either keeps too sweet or sours with an "off" and bitter flavor combined, and churns with difficulty.

I suggest the following method. Collect the cream that you are to have for a churning in a clean crock or tin vesvel, keeping it cold in a cool place until the day before churning; then set in a warm place of about 70 degrees Fahrenheit and add starter of one quart of clean flavored clabbered milk to three gallons of cream and allow to ripen until thick consistency. Cool to 58 degrees to 62 degrees Fahrenheit and churn.

If the sour clabbered milk cannot be had for a starter, a quart of the buttermilk of the previous churning will do if it is of a clean acid flavor.

Making Fertilizer of Bone

I have a large quantity of bone and a bone grinder. How can I make fertilizer and will it pay for me to work it up? I can get $15 per ton and can buy manure for my 12-acre place for about 75 cents per ton, which looks to me cheaper than the bone.—Subscriber, Santa Ana.

The phosphorus in bone is one of the most valuable additions to California soils. To make it available the bone is usually ground to a very fine "flour." Some farmers believe in going farther and making the phosphorus immediately available by treating the bone with acid. This reduces it to the form of acidulated bone or superphosphate, when all the phosphorus, or as usually expressed phosphoric acid, is available for the use of plant life. Personally, we would use the untreated bone, providing it has been reduced to a very fine consistency. Perhaps we should not say this in a public way because this is a question which causes repeated contention, for many believe implicitly in the acidulating. If the bone is of good commercial quality it should contain 3.5 to 4.5 per cent nitrogen and nine to 11 per cent of phosphorus. This would be close to 20 to 25 per cent of phosphoric acid. This, bear in mind, is bone without steaming or acidulating. But regardless of the value of this bone meal we would use all the stable manure which we could possibly afford when it can be had at 75 cents per ton. Hopkins' "Soil Fertility and Permanent Agriculture" gives the value of average stable manure as around $2.25. Of course the expense of hauling and handling must be considered for stable manure is very bulky. Its content of nitrogen is usually greater than that of bone but its content of phosphorus is not one-fifth that of bone though great value is given to stable manure in the humus which it adds to the soil.

Milking Machine for Small Herd

A Riverside County dairyman writes inquiring as to the value of the milking machine in the small dairy. This particular inquirer's dairy has only seven cows. He wishes to know whether it would be possible to lighten the drudgery of milking, also to shorten the task, by the use of the machine, and whether such a machine could be installed at a cost of not over $150. We will pass this question on to our subscribers. Who has tried the milking machine and found it a success? Give for Cultivator readers information which comes from experience.

Drowning Out Bermuda

Is it possible to drown out Bermuda during the summer time?—Subscriber, Fresno.

We do not doubt that it would be possible but the supply of water required and the loss of the use of the land while it was being done would prohibit such practice we think. However, we will be glad to hear from any subscriber who can inform us.

"POULTRY BREEDING AND MANAGEMENT"

"Poultry Breeding and Management" by James Dryden, professor of poultry husbandry, Oregon Agricultural College, published by Orange Judd Company, New York. Net price $1.60.

James Dryden is one of the most practical poultry people on the Pacific Coast and now he has gone into print. He says:

"There need be no apologies for new poultry books. The industry is important, the poultry constituency large, and one poultry book representing the finding of one author would hardly be presumed to meet all demands. In these days of progress in the science, if it may be so called, of poultry husbandry, it is imperative that new compilations be made and new books published at frequent intervals that the poultry keeper may receive the benefit of early knowledge of new discoveries.

"This book, therefore, has been prepared that it may add to the available poultry literature; not that it may supplant other books, nor that it should be the last word on the subject. The author is fully conscious of its imperfections; but, to every student of poultry culture, and to every poultry farmer, he earnestly hopes that it may bring some helpful message."

There are 17 chapters touching upon the historical aspect, evolution of the modern fowl, classification of breeds and description, principles of breeding, problems of fecundity, systems of farming, housing, fundamentals of feeding, methods, methods of hatching, brooding, marketing and finally a chapter on diseases and parasites. The book is well printed, well bound and fully illustrated.

MAIL BOX POST

Take three joints of old stove pipe, set in ground at proper depth; next stick some old rod or axle down through the middle; now flatten the top a little, and put bolts through to hold it in place. Fill with slush cement, and after it hardens cut off the old pipe, bolt on the mail box and you have a post that will last forever and has cost only a few cents —Ex.

J. M. Davison of Arlington has been selected as president of the newly organized Southern California Poultrymen's Association.

CALIFORNIA MILK PRODUCERS ASSOCIATION

Continued from Page 51

selves together in what is now known as the California Milk Producers' Association. The purposes for which this association was organized are primarily as follows: To furnish facilities and agencies through which such bona fide milk producers as desire to become members shall market their milk and dairy products upon a uniform plan in such a manner as to bring about a better standard of quality, a more uniform distribution, and a larger consumption thereof, to encourage its members to better their methods of production, to standardize and develop their product, to find the readiest and most available market for same in Los Angeles and towns adjacent thereto.

The association believes that the interests of the producer and consumer of milk and dairy products have much in common and imperatively demand the production and delivery to the consumer of good, clean, pure milk and other dairy products, to assist in securing effective legislation that will bring about this result, and to lend its aid at all times to the enforcement of such legislation, ordinances and statutes.

The association also gives its attention to improved breeding, economical feeding, and to bring about the operation of model dairies.

It has gathered data and information from all the different sources in regard to the quality, production and consumption of milk and dairy products. It furnishes its members with feed at cost, buying direct from the producer of same.

During the past year the association, which represents practically 50 per cent of the milk supply of Southern California, has been able to secure to its members a better price for their product, has helped them produce their milk more cheaply, has secured an efficient system of sterilization and careful handling of their product, and is at the present time producing about 90 per cent of their product as Grade A Milk, under the regulations required by the state law.

They maintain one of the best equipped laboratories in the state for the purpose of testing their milk supply for bacteria and butter fat, under the able administration of Dr. C. H. Griffen, well known as bacteriologist in this state.

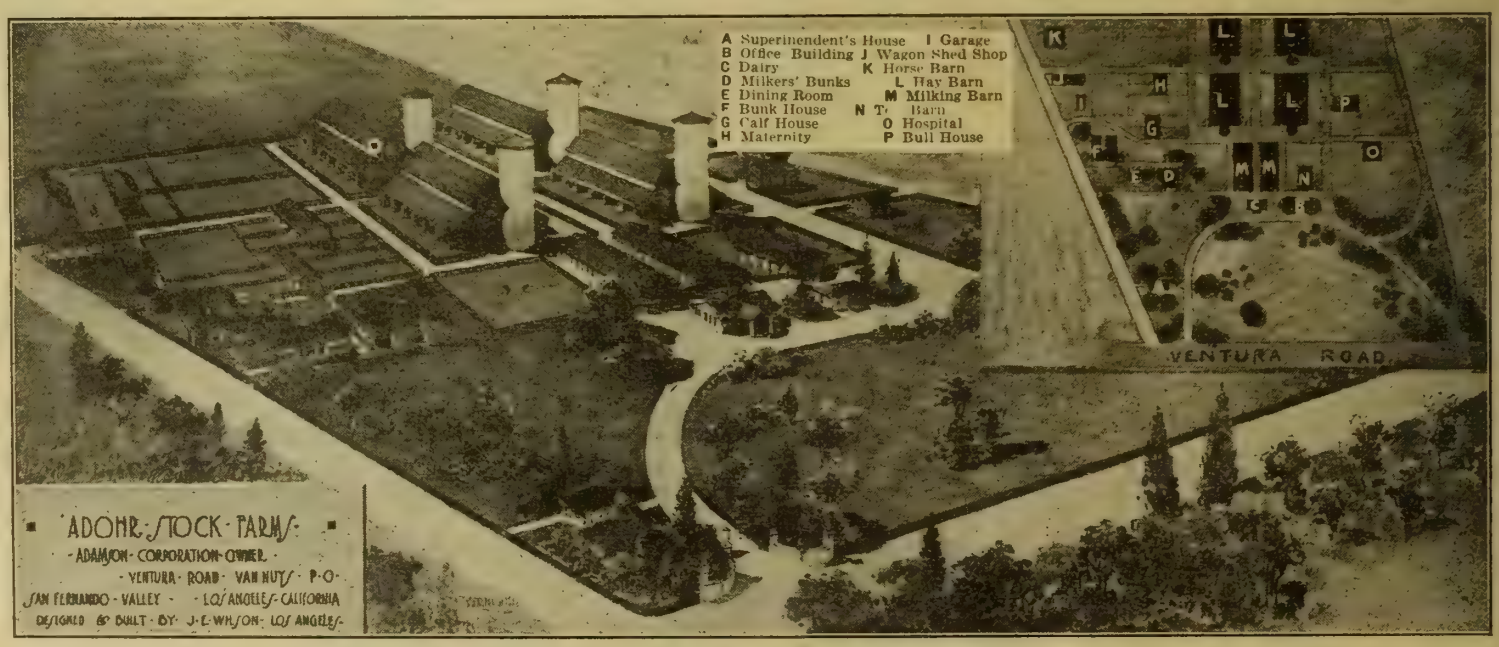
The subject of testing the cows of the association for production is now being carefully studied, and during the next year a campaign will undoubtedly be started to eliminate the unprofitable cows from the herds and start a system of breeding that will bring the herds all up to a higher standard of production.

In the marketing of their product they have secured the hearty cooperation of the creameries with whom they are doing business. It is their desire to cooperate and aid the distributor in every way, as their motto is "Cooperation", and they believe that this should be carried out in all of their transactions with the producer, distributor and consumer alike. Probably never before in the history of the dairy business has an association realized such results in so short a time, and the future is bright with prospects of far greater accomplishments during the coming year.

Mr. Walker of Peters, Lamson & Walker, writes that he has just received a gilt from Mr. R. Wilde of Genoa, Nebraska, the heaviest winner at the National Swine Show at Omaha this year. She is bred to his famous boar, Critic B. He has also received a gilt bred to King the Col. from O. S. Larson of Logan, Iowa. In their grade herd they are now weaning 500 pigs per month and the number is increasing every month as the gilts come in. The last car of hogs brought $9.65, the packer who bought them at $9.60 without seeing them paying five cents more for them upon arrival at the slaughter house.

J. W. Sefton, San Diego County, has one of the largest herds of registered Tamworth hogs in the United States. He raises them as a strictly market proposition and has kept a thorough cost system to show that in four years' time he has made a nice profit on his ranch crops by having the hogs. He is an advocate of the sound theory that the only sensible way to farm in the 20th century is to walk the products of the soil to market. A few months ago Mr. Sefton transferred about 50 head of brood sows to his big ranch in the Imperial Valley, but he retained the other half of the herd on his San Diego Ranch.

Adohr Stock Farms



GUERNSEYS

PROFITABLE PRODUCERS — PERSISTENT MILKERS — PREPOTENT SIRES
GOOD DISPOSITION — HIGH COLORED PRODUCT — STRONG CONSTITUTION

The Adamson Corporation announces the establishment of a Guernsey Herd. The intention is to develop a herd that will appeal to dairymen and breeders alike.

The services of Mr. E. W Major, well known as a judge of dairy cattle, have been engaged to select as foundation stock animals which combine trueness to breed type with productive capacity.

Watch For Future Announcements

Edgemoor Farm Ranks With the Best

SOUTHERN California has reason to be proud of her many fine herds of blooded live stock, particularly in the dairy breeds. Few equal and none surpass the Edgemoor herd of Guernseys in San Diego County owned by W. H. Dupee. The farm is located at Santee, just 16 miles from San Diego, and was established about four years ago. It covers 600 acres in the El Cajon Valley. There are 25 buildings on the farm, all new, and built in the most up-to-date style suitable for dairy farm purposes. Architectural plans and interior equipment are modeled after the most practical for the purpose.

The Edgemoor Guernsey herd, which at present numbers 160 head, includes over 40 May Roses, there being 14 Ne Plus Ultras in the lot. We do not know of any other Guernsey herd that has a larger number of Ne Plus Ultra bred Guernseys. Herd bulls at Edgemoor have been selected both for their individuality and blood lines, bulls strong in the great producing lines of the breed. The senior herd sire, Imp Itchen May King, is familiar to every Guernsey breeder on the coast. His get are coming two years old. In conformation King's get are of the highest type. None of them have as yet come into milk. Many of the A. R. records at Edgemoor were made by cows in transit from New Jersey to the coast, and many others were made under regular farm conditions. Edgemoor Guernseys, both males and females, have won championship and grand championship honors at various state fairs as well as at Panama-Pacific International Exposition 1915.

Royal Rose King of Edgemoor, a son of Imp Itchen May King, and Belladia, the great cow which just completed her yearly Class A record of 935.14 pounds butterfat from 19,631 pounds milk (also has Class D record of 669 pounds butterfat), is a typey two-year-old bull from which Edgemoor expects great things. He will be a candidate for grand championship at this year's shows.

Another fine young sire is the Langwater bred bull, Langwater El Dorado, junior champion at 1916 California state fair. He was selected from the celebrated Langwater herd at North Easton, Massachusetts, owned by F. Lothrop Ames, recognized as the most successful Guernsey breeder either at home or abroad. At the October sale of Langwater Guernseys 41 females bred by Mr. Ames sold for $58,000, an average of $1421, highest priced individual brought $6150, both world's records. El Dorado is particularly rich in the May Rose blood, going eight times through the highest producing channels to May Rose 2nd. His granddam on dam's side is Langwater Hope, who has a two-year-old record of 773 pounds butterfat and 1003 pounds in Class A.

The three-year-old sire, Dairymaid's Nonpareil of Iowa, is being used freely at Edgemoor. He is a strongly inbred Glenwood bull and was selected for the present owner by Chas. L. Hill, the noted dairy cattle judge at many national shows. Mr. Dupee wanted a bull carrying high production in his pedigree, together with Glenwood blood, and in Nonpareil he certainly secured a good one. His dam, Elberon's Glenwood of Haddon, has a record of 824 pounds butterfat. His nearest dam on sire's side has an A. R. record of 910 pounds butterfat, making his two nearest dams average 867¼ pounds butterfat.

The star cow at Edgemoor is Imp Itchen Wood Sorrel, a champion and grand champion wherever shown. While her record is but 556 pounds butterfat made in the heifer class, she is equal to making a large record if again put on test, for she is a very heavy and persistent milker, but being the star of the herd it is not deemed advisable to chance getting her out of condition.

It is the sole aim at Edgemoor to breed for large production; show ring performances are of secondary consideration, and with the class of animals in the herd, pronounced by Guernsey experts as second to none, the ambition of the owner is certainly being attained.

A Shorthorn Family Since 1869

Written for California Cultivator.

SHORTLY after the Civil War a Mr. Hall who resided in Minnesota bought a bred Shorthorn heifer of Scotch breeding. For 20 years he bred Shorthorns until his eldest son was capable of running the business. The eldest son was none other than F. L. Hall, now of Perris, Riverside County.

Mr. Hall has only been in California for the past three years, having lived previously in Minnesota where he bred Shorthorns and Berkshires. He exhibited at the county and state fairs in his own state and also showed his stock at South Dakota and other nearby fairs. He has dozens of ribbons and trophies to show that his stock was in the prize winning class frequently.

When the Halls migrated to California they brought their best livestock along and have been breeding from this foundation ever since. This last year saw the Hall Berkshires at the state and Riverside County fairs and they were in the one, two, three class at both fairs. The Shorthorn herd sire is Royal Archer Sultan, a Scotch bred red bull of heavy bone and substance. He scales over a ton and is a four year old. His calves are all typey and built both wide and deep. The females are mostly of Orange Blossom strain and have been the real basis of Mr. Hall's success in the Shorthorn business. He says that prices received for the 1916 bull calf crop were almost double the prices of former years and he plans to increase his herd as soon as possible.

Pure Bred Beef Cattle Reach Their Highest Development in California
Group of Scotch Shorthorns on F. L. Hall Ranch.

In Ames Rival 118 Mr. Hall has a high class young sire. He is a son of Rival's Champion's Best. His best points are his smoothness, ham, and size of bone. Undoubtedly he will make a satisfactory sire. A full sister to Winona's Royal Champion, Jr., champion at Sacramento this year, both sired by Laurel Champion, is one of the very best gilts in the herd.

There are some Grand Leader and Masterpiece bred sows on this ranch which will farrow some show pigs this spring. In the Hall place are 140 acres just off the highway on which alfalfa and grain is grown for the stock.

Hollow Hill Guernsey Farm a Tourist Mecca

Written for California Cultivator.

SITUATED right in the heart of San Bernardino County's citrus belt, Hollow Hill Farm, Colton, is one of the most beautiful in the state. The main highway between Riverside and Redlands passes through the property, and it is a common thing to see as many as a dozen automobile parties filing through the scrupulously clean barns, admiring the many interesting sights. Much has been written about the test barns, the milk barn, the calf barn, patent equipment, bull pens, corrals, etc. Visitors are taken around the plant and finally view the interior of the building where the certified milk is produced, through glass, and while they are eating ice cream or drinking rich Guernsey milk at individual tables placed there for just this purpose. But this story will give Cultivator readers a line on the breeding of the "business end" of Hollow Hill, i. e., the animals.

Mr. W. G. Wilder, the distinguished publisher, who lives in New York City after he has remained at his California home as long as possible every year, is the owner of Hollow Hill and planned every detail of its construction. His home is located on the highest hill surrounding the farm, from which he gets one of the most beautiful and extensive views to be had in California.

Grouped in the hollow portion of the landscape are the many buildings which accommodate the string of over 100 Guernseys. The cows are rich in the blood of the May Rose and Masher families, two of the greatest of the breed. There are three herd bulls heading the Hollow Hill string of cows including: King Masher of Redlands, a four year old son of King Masher and out of Coras Beatrice who has an A. R. record of 368 pounds butterfat in class "G"; King of Hollow Hill, a three year old bull bred by Langwater Farm. He was sired by Itchen Daisy's May King of Langwater whose dam has an A. R. record of 714 pounds butterfat in class "B"; and Coras Glen, a three year old out of an A. R. granddaughter of Governor of the Chene. This youngster is the typyest bull in the herd. He captured championship honors at the 1916 Riverside fair and gives great promise.

The cows have been on official test, and the first to finish a full year's work will be Caroline of Chilmark 24812 A. R., and at the rate she is going she will make over 750 pounds butterfat when she finishes in April if nothing happens. This cow is a grand individual of excellent Guernsey type. She has a two year old record of 308 pounds butterfat.

Another high class cow is Imp Cherry 3rd of the Effords. She is in the state dairy cow competition and was the leading cow for the month of November over all breeds. There are any number of big producers in this herd, and they will be heard from as they gradually complete their year's work. Certified milk having a bacterial count of less than 1000 to the drop (state law allows a maximum count of 10,000) is produced every day on this ranch. Anyone familiar with the difficulties of producing milk of this purity will appreciate the care and work entailed.

Within the past year a fine herd of Berkshire hogs was established at Hollow Hill, and they brought in some good ones. The senior herd sire, Ranchos Otto 20680, is not a show boar any more, but he is a great boar all the same. He is a grandson of Rival's Lord Premier and out of a Masterpiece sow, a combination that has produced a lot of winners. The

junior sire, Ames Rival 31st, bred by Dean Curtiss, is probably the best prospect in the herd. He is out of Belle Rival 17th, and is exceptionally good in the ham, bone and heart, and carries the quality of his breeding. There are 18 brood sows, ten gilts, and some younger boars in the herd at the present time.

Hollow Hill covers 260 acres of rolling land and has one of the most picturesque locations in Southern California.

A Young Bull with a Wide Reputation

When James J. Jeffries and associates paid $2000 for a four-months-old bull calf at the Rhoades-McAlister sale it was considered a sensational price, but there are men today who attended that sale, and since then have seen the way that the daughters of the sire, King Korndyke Sadie Vale, are coming on, two having just made records over 31 pounds, and have seen a granddaughter of King Segis break the world's record by producing over 50 pounds of butter in seven days (King

A Coming Youngster

King Paul Korndyke Vale, the $2000 son of King Korndyke Sadie Vale, who is owned jointly by five different parties.

Korndyke Sadie Vale is a grandson of King Segis through his best son and a brother to Mabel Segis Korndyke, a 40-pound four-year-old granddaughter of King Segis), and noted the number of the largest and most successful breeders in the United States who are getting into the King Segis line of breeding by using sons of King Korndyke Sadie Vale, that have remarked that instead of being a sensational price, it was rather a sale where less than half of the actual value of the animal was obtained.

King Paul Korndyke Vale's two nearest dams average 36.24 pounds of butter in seven days. His dam is by Sir Sadie Cornucopia, whose dam was the first 30-pound cow of the breed and whose sire's dam was the famous Aaggie Cornucopia Pauline, 34.32 as a four-year-old, world's record at the time it was made.

This great young sire will be placed in active service at the Jeffries herd and at the Edgemont Holstein Farm herd, where he will be afforded a wonderful opportunity. Already a number of outside cows have been booked to breed to him by far-sighted breeders who appreciate his wonderful breeding.

"King Paul" is owned jointly by Jas. J. Jeffries, W. H. Taylor, C. W. Anderson, Harlan Dailey, Ben A. and Harold B. Rhoades, and with this class of men behind him there is no question but what he will be made one of the truly great sires of the breed.

Delta Farm and Live Stock Company, San Bernardino County, recently purchased over 100 registered Duroc-Jersey gilts, all bred. They came from the Peters-Lamson-Walker herd and are a splendid foundation. The Delta company also has a large herd of registered Berkshires. As soon as possible a pure bred herd of Guernseys and Holsteins will be put in and from the upward of 1000 acres of land in the project enough feed will be grown to supply this large stock farm. Mr. B. F. Graham of Los Angeles is secretary of the company and Mr. J. J. Johnson, manager. Mr. Von Rosen will have charge of both the cattle and hog departments.

YEAR OLD DAUGHTER OF I.B.A. WONDER

BREEDING

That Should Suit You

My herd contains LARGE TYPE strains from the herds of Henry Fessenmeyer and J. W. Pfander of Clarinda, Iowa; Isaac Overton, Knoxville, Iowa; Peter Mouw, Orange City, Iowa; M. P. Hancher, Rolfe, Iowa. MEDIUM TYPE strains from the herds of Link Lukens, Disco, Ind.; J. N. Kemp, Kenny, Ill.; Frank Winn, Randolph, Mo. These are among the most prominent and most successful breeders in the country. My foundation stock from them was some of the best hogs they have ever bred. I now have for sale some of the best individuals I have ever raised; prize winning stock. A few bred gilts, yearling sows, a nice lot of fall farrowed pigs and a number of exceptional quality service boars. My best advertisements are the men who have bought from me. I absolutely guarantee to please you or refund you your money.

COLTON, CALIFORNIA

Visitors are Always Welcome at Hollow Hill

WOULD YOU BACK A SPRINTER TO WIN A LONG DISTANCE RACE?

Then Why Gamble on Dairy Blood of Unknown Endurance in High Production?

It is the cow that yields large quantities of milk and butterfat and KEEPS UP HER PRODUCTION that makes the balance on the right side of the dairy ledger at the end of the year.

And there is just one way to secure cows that will yield heavily of milk and butterfat, for the greater portion of each year, and for many such years in succession—and that way is to breed up through the use of a purebred registered dairy sire backed by generations of persistent high producers and possessing the true dairy type that makes for constitution, ruggedness, and long life.

Our herd of registered Holsteins has now reached a stage of development where we are able to offer breeding stock that combines the best blood developed through many years of official and semi-official testing and a careful selection of strong, vigorous Holstein type.

Segis Pontiac De Kol Burke

In our senior herd sire, **SEGIS PONTIAC DE KOL BURKE,** we have a bull that has already demonstrated to a remarkable degree his ability to transmit show ring type, and his first daughters to freshen are proving his ability to transmit the wonderful production behind him.

In the show ring his sire was twice Grand Champion at California State Fair, his dam was Grand Champion, he himself was Grand Champion, one of his daughters was Grand Champion, one of his sons was Junior Champion, and another son was Junior Champion at the Panama-Pacific International Exposition.

In production records his daughters are starting off at a most satisfactory gait. Only four have so far finished 7-day records, and they are as follows:

	Butter	Milk
Aralia Mead Pontiac De Kol Age—2 yrs. 7 mo. 12 days.	16.80	370.2
Aaggie Acme Burke Age—2 yrs. 4 mo. 5 days.	15.23	364.2
Aralia De Kol Pontiac Mead Age—2 yrs. 7 mo. 22 days.	23.30	575.9
Cobossie Korndyke Burke Age—2 yrs. 3 mo. 11 days.	19.29	414.2

Thus producing in 7 days an average of 406.1 pounds milk and 18.65 pounds butter at an average age of 2 years, 5 months and 20 days.

GREAT MILK YIELD---HIGH PER CENT OF FAT

Large yearly production of milk that tests high in butterfat is characteristic of the daughters of our herd sire **KING MEAD OF RIVERSIDE.** This sire has had only a very limited opportunity, yet he has already won a place among the greatest sires of the breed. His first six two-year-old daughters on yearly test made an average of 13,905.4 pounds milk and 685.25 pounds butter, average per cent butterfat over 4%. As a four-year-old one of his daughters made a yearly record of 19,577.3 pounds milk and 1095.10 pounds butter, average butterfat for the year 4.49%.

Aaggie Acme of Riverside 2nd

His first daughter to reach mature age is **AAGGIE ACME OF RIVERSIDE 2ND,** the new State Champion Cow in the 7 and 30-day divisions. In 7 days she produced under official test 627.3 pounds milk and 35.37 pounds butter, and in 30 days 2720.7 pounds milk and 142.31 pounds butter.

Sons and daughters of **KING MEAD OF RIVERSIDE** are of the most desirable type and possess the uniformity to stamp their sire as prepotent to an unusual degree.

OUR JUNIOR HERD SIRE

KING MORCO ALCARTRA

Sire: SEGIS PONTIAC DE KOL BURKE.

Dam: TILLY ALCARTRA, the world's greatest dairy cow.

The records of his dam and sire's dam average 842.9 pounds milk and 32.26 pounds butter in 7 days; 29,638.9 pounds milk and 1137.79 pounds butter in one year.

SIR AAGGIE DE KOL ACME

Dam: AAGGIE ACME OF RIVERSIDE 2ND, the champion butter producer of California in class. The records of his three nearest dams average 642.5 pounds milk and 31.28 pounds butter in 7 days, 20,899.9 pounds milk and 1015.41 pounds butter in one year.

Keep Your Eye on These Two

REMEMBER: That we can supply you with a herd bull whether you own a grade dairy herd or a high class herd of registered Holsteins. We can supply you with a high class show prospect, a bull backed by generations of high short-period records, or a bull backed by some of the greatest yearly records yet accomplished. And our prices are conceded to be very reasonable for the class of stock we breed and sell.

Tulare County's First Thirty- Pound Cow

Written for California Cultivator

W. J. HIGDON, Tulare, writes us the details of the story about his grand young Holstein heifer, Paula Segis 184828. Paula freshened November 25 and finished her first seven day test on December 2. She made 30.49 pounds butter and 607.4 pounds milk. Mr. Higdon continued her on test for the 30 day period and she rewarded his faith in her by producing 123.55 pounds butter and 2557.7 pounds milk. Paula was sired by Sir Ormsby Burke Segis, 23 A. R. O. daughters, he by King Segis. Her dam, Paula DeKol Ormsby 99214. is a daughter of Sir Hengerveld DeKol Ormsby, 23 A. R. O. daughters.

Paula Segis 184828

Five-year-old who made 30.49 pounds butter in seven days and 123.55 pounds in 30 days in December. Owned by W. J. Higdon.

Paula Segis freshened at five years, two months and six days. Up until the day she freshened she ran with the herd and did not receive a pound of grain to prepare her for the test. Even during her seven days test she was fed no balanced ration but only 17 pounds of ground barley and 17 pounds dried beet pulp, fed dry together with all the alfalfa hay and silage she would eat. That she made her fine record under these conditions is really remarkable. Mr. Higdon bought this cow last summer from the Davis herd in Washington. She was one of 11 other head in the shipment, all bred to the $10,000 bull, Sir Bessie Fobes Tritomia, a son of Jesse Fobes Bessie Homestead, 34.96 pounds butter in seven days. As she dropped a fine heifer calf when she freshened Mr. Higdon feels that he made a good investment when he bought these cows. Three other young cows in this herd will freshen soon and be put on test, and as they are by the same sire as Paula Segis and out of dams with higher records there may be some more 30 pound records made.

A REGISTERED HOLSTEIN BULL SALE

On Saturday, January 6, 19 registered Holstein bulls were sold at public auction at Gonzales by California Breeders Sales and Pedigree Company of Sacramento. The consignors to the sale were A. W. Morris & Sons Corporation, Woodland; Henderson Company, Fred W. Kiesel, and Dr. E. J. Weldon, Sacramento. These breeders consigned a very desirable lot of young bulls, eleven of them calves, seven yearlings, and one just past two years. The 19 head sold for a total of $3875, an average of $204, with a top price of $500 secured for one of the Henderson Company bulls.

While these prices were very low for the quality of bulls offered both the consignors and the sales company express satisfaction with the outcome of the sale for the bulls all went into grade dairy herds that will unquestionably be greatly benefited, as will also the entire dairy community into which they went. Out of the total number of buyers at the sale only three had ever before owned a pure-bred sire, and this fact alone is sufficient recompense for the considerable amount of labor and expense involved in the organization and completion of the first public sale of registered Holstein bulls ever held on the Pacific Coast.

Col. Ben A. Rhoades was the auctioneer, with Frank L. Morris in the box and Dr. E. J. Weldon and C. L. Hughes in the ring.

L. D. Collins reports sale of two bred Duroc-Jersey gilts to J. E. Owens.

COST What you put into a Cream Separator VALUE What you get out of your Cream Separator

It isn't the "out go" but the "income" that determines the real value of a Cream Separator

It's Cheaper to Buy a DE LAVAL CREAM SEPARATOR

VALUE depends upon the amount and the quality of service the article gives you—what you get out of it.

You get by far the greatest actual VALUE for your money when you buy a De Laval—BECAUSE it will give you much better and longer SERVICE than any other separator.

From the standpoint of its greater durability alone, the De Laval is the most economical cream separator to buy, and when you also take into consideration its cleaner skimming, easier running, greater capacity and less cost for repairs, the price of the "cheapest" machine on the market is most exorbitant compared with that of the De Laval.

And there is no reason why you should let its FIRST COST stand in the way either, because the De Laval may be purchased on such liberal terms that it will actually pay for itself out of its own savings.

McAlister Holsteins Have Made Great Records

Written for California Cultivator

SOUTHERN California has a great many fine herds of Holstein cattle, but none hold a higher place than the McAlister herd located at Chino. The McAlister animals have never been shown extensively at the fairs but have put in their time at the pail where they have made and broken many existing records.

There are about 200 head of registered animals in the herd, of which 185 head are females. The senior herd sire is the famous bull, King Segis De Kol Korndyke, who is the only bull in the world from a 37-pound cow, to have four 30-pound daughters. He is the sire of the world's champion junior four-year-old for seven and 30 days, Mabel Segis Korndkye, and also the sire of the most sensational young bull of the breed, King Korndyke Sadie Vale, whose two first three-year-old daughters made 32 pounds and 31 pounds butter in seven days respectively, while the average production of two of his two-year-old daughters excels that of any other bull.

One of the McAlister junior herd sires is a son of King Korndyke's Sadie Vale, and out of a cow which they consider the best individual in the herd. Another young sire is a son of Winnie Korndyke Cornucopia De Kol, who recently broke the world's milk record for ten months, and who is the only cow of the breed to give over 31,000 pounds milk, and 1200 pounds butter in one year.

Every cow in the McAlister herd is put on official test as soon as she freshens. In the past seven months they have not had a two-year-old heifer to make below 17.54 pounds butter in seven days, or any second calf heifer or cow to make less than 21 pounds butter in seven days. One of the junior two-year-old heifers broke the state record for both seven and 30-day periods, and three other first calf heifers in the last month have made over 21 pounds butter in seven days.

It has been proven by the latest researches that the germs of such contagious diseases as tuberculosis, abortion and sterility of dairy cattle are transmitted to the young stock through the milk and this can be only positively prevented by the feeding of boiled milk. With this danger ever in mind the first aim on the McAlister ranch is to take every precaution. Every calf is fed on boiled milk when eight days old and the strictest sanitation employed with the growing of young stock.

Undoubtedly many of the present Holstein records for milk and butter production will be broken during 1917 and it is safe to say that the names of some of the McAlister cows will appear on the honor roll.

Star Rena Wayne Pietertje 2nd

Butter, 3½ years, 34.35 pounds in seven days. Former world's champion three-year-old. Owned by McAlister & Sons, Chino.

The Whittier State School has Fine Lot of Holstein Cattle and Berkshire Hogs

Written for California Cultivator.

STATE institutions are as a rule leaders in the development of livestock, and Whittier is no exception. The school has made some state records on butter production with the Holsteins and carries a number of animals on official test all the time.

The Pride of Whittier State School

The most recent achievement was the performance of the three year old heifer, Windsor Milkmaid Segis 210838, who as a senior three year old broke the state record for butter production in seven days. She made 26.04 pounds butter and 566.1 pounds milk. In 30 days she made 97.89 pounds butter and 2446.8 pounds milk. The Holstein foundation was secured from the McAlister and Shoemaker sale a few years ago, a great many of the cattle coming from Colorado. King Segis De Kol Mead 132363, the young sire at the head of the herd is a highly bred sire who has been getting some great calves. When his heifers come in milk and are put on test they should make some fine records.

The herd of purebred Berkshires is another source of pride at Whittier. Two of the Curtiss bred gilts in the herd are show animals. There are any number of other good individuals but these two stand out. Mr. Balis, who is superintendent of the livestock department of the school, is particularly fitted to handle the work. The boys at the institution do all of the work and under Mr. Balis' guidance and advice they are making good stockmen as well as better citizens.

Edgemont Holstein Farm Up-to-Date Plant

Written for California Cultivator

EFFICIENCY, that is the watchword at the Edgemont Holstein Farm located at Burbank just across the hills from Hollywood, Los Angeles' finest suburb.

While the ranch is not large, by rotating the crops it produces an amount of feed that would do credit to ranches the heavy and persistent milking qualities of this herd. The females are all fashionably bred, and the herd sire is the famous young sire, King Paul Korndyke Vale, a son of King Korndyke Sadie Vale. The two nearest dams of this youngster average almost 37 pounds of butter in seven days.

The dairy plant deserves praise.

Edgemont Farms
A ranch where intensive farming in its most advanced stage is practiced.

several times its size. Thirty tons of corn to the acre was the record this fall, and a crop of barley had been cut ahead of the corn. A 60 foot concrete silo was erected this year and filled to its capacity. It has saved many dollars in reducing the feed bill.

The herd includes 40 head of registered Holstein and Guernsey cattle. Every head is a perfect dairy type, and on looking over the individual production sheets one is impressed with Concrete floors and mangers are used. The milk house is especially good and is equipped with all modern devices for the quick and sanitary handling of milk.

The ranch produces a "Special Milk" from a tuberculin tested herd. The combination of Holstein and Guernsey milk is making a great hit in Hollywood where it is now retailed. The average bacteria count on this milk is now running under 4000.

BERKSHIRE CONVENTION

The Western Berkshire Congress and sale will be held at the university farm, Davis, February 13-15, or rather the meeting will be held Tuesday and Wednesday the 13th and 14th and the sale the 15th. A. J. Lovejoy, one of the first and the greatest of Berkshire breeders, will be present and make addresses. There will be a student judging contest, ladies' judging contest, and a royal good time as well. All Berkshire breeders are invited to make consignments. A committee will be appointed to pass on all sale animals. If an animal is not considered a worthy representative of the breed it will be returned and not offered for sale. Every animal sold will be a guaranteed breeder by the consignor.

L. E. Frost of Chicago is managing the sale and Auctioneer Hord of San Francisco will cry it. President Guilford is urging every believer in the Berkshire breed to be at this meeting and sale.

Some Trophies to Be Awarded at the Berkshire Congress and Sale

The movement as started is receiving the support of retail dairymen and city councils of the county as well as that of State Dairy Inspector C. A. Starkweather. Petition for establishment of the district was presented to the county board of supervisors at its regular meeting, January 8.

MILK INSPECTION

We note in a Central California exchange that a movement is under way for the establishment of a milk inspection and grading district of Stanislaus County which will fully comply with the state law regulating the sale of milk by retail in the several towns of the county, but will also affect all milk sold to creameries, cheese factories and condensaries as well.

The Reason Our Dairymen Should Have Silos

Written for California Cultivator

THE problem which looms biggest, just at this time, to the Southern California dairyman and which will become increasingly intense unless remedied, is that of cow feed. First and foremost the dairyman must possess good stock; a good cow, then good feed. A cow with any number of "A. R. O." relatives cannot amount to much without proper feed. The dairyman who spends all his income on buying high priced feed will get "no better fast."

The territory which is located close enough to Los Angeles and her surrounding cities to furnish fresh raw whole milk grows, it is conservatively estimated, one-third of the alfalfa which is fed. This is caused by the high price of land, climatic conditions, etc., and in the years to come this territory will produce less and less alfalfa, which will compel the dairyman to ship in an increasing amount of hay at a large expense. The one salvation of the dairyman in this territory is the silo. By means of the silo one acre can be made to produce as much animal nutrition as three acres of alfalfa.

Frampton Brothers at Artesia raised over 30 tons of corn to the acre, then planted potatoes and raised a bumper crop on the same land. They raised enough corn on nine and one-half acres to feed 40 cows 40 pounds of ensilage per day for a year. This ensilage saved them enough, and they had dried beet pulp, to pay the entire first cost of their two 14 ft. by 41 ft. 6 inches monolithic concrete silos. By careful cost record the Framptons found they produced the corn and placed it in the silo at a cost of $1.05 per ton of ensilage. While others were losing money on their dairies by paying $20 per ton for hay, the Framptons had the cheapest feed known in their dairy experience.

A silo can make the difference between success and failure. It is probably more economically necessary in Southern California than "back East" in Wisconsin, Ohio or Kansas where a man cannot be in the dairy business without one.

Not alone for the dairyman in a limited hay producing section is the silo a necessity but also for the stock, butter and cheese men. The Tehachapi Cattle Company of Bakersfield have six concrete silos 20 feet by 60 feet of a total capacity of over 3000 tons

Devon Cattle in San Diego County

of ensilage which they fill with kaffir corn. The manager doubts if they would be in the beef business if they could not have silos.

A silo not only saves 40 per cent of the corn crop but often saves the entire first cutting of alfalfa. When the first cutting is too weedy to feed or is captured by fox tail it can be placed in the silo and not only saved but 15 per cent added to its nutritive value. The State University has proved for us that fox tail is very nutritious and that when siloed with alfalfa is very palatable and none wasted.

There is no more limit to the crops that can be saved by placing in a silo than there is a limit to the good things the housewife can preserve so appetizingly in the fruit jar.

Burbank, - - California

Shorthorns

HERD ESTABLISHED 1880

We have been breeding beef cattle on our farm for 37 years, working towards a definite type and standard of perfection. We have had a reasonable amount of success in our work and think that our present herd is the best we have ever owned. That the judges at the state fairs and stock shows agree with us is indicated by our 1916 winnings. We can at all times furnish single animals of the best breeding and individuality. We can also fill orders at very short notice for entire herds for foundation purposes. If interested write us for full particulars.

Berkshires

HERD ESTABLISHED 1892

Twenty-five years ago our herd was started and we have been improving it ever since. At this time our herd has the finest individuals we have ever owned. Our sows are right in type with almost perfect lines. They have strong constitution, good bone, size, depth, length and quality. They have large average litters of strong, active pigs. Our herd boar, Artful King 11th of Iowana Farm breeding is a royal specimen. Pigs from our mating are winning favor with many breeders. Our 1916 State Fair and Stock Show awards speak for their show ring quality. We will gladly quote you prices on breeding boars, sows and gilts, bred or open, or on weanling pigs.

Poland Chinas

This grand breed of hogs, THE FARMER'S KIND, has been bred on my farm under my personal oversight for many years. The result is a herd of hogs that win 1st Prizes, Championships and Grand Championships wherever shown. Better than this they are all individuals of strong constitution, good bone, wide sprung ribs, splendid hams, straight, smooth and right in every way. They are easy keepers, coming to market weight and condition at six months of age. They make a profit as a market pork hog under present conditions of high feed prices. Years of experience convince me that they are the best hog for California conditions and that they are in every way

The Hog for the California Farmer

TWO OF MY HERD BOARS

SURPRISE

First in Sacramento, 1916; first in Hanford, 1916. Sired by Gold Coin, who was third at San Francisco, 1915. His dam was Lady Style, who was fourth at San Francisco, 1915.

CHIEFS VICTOR

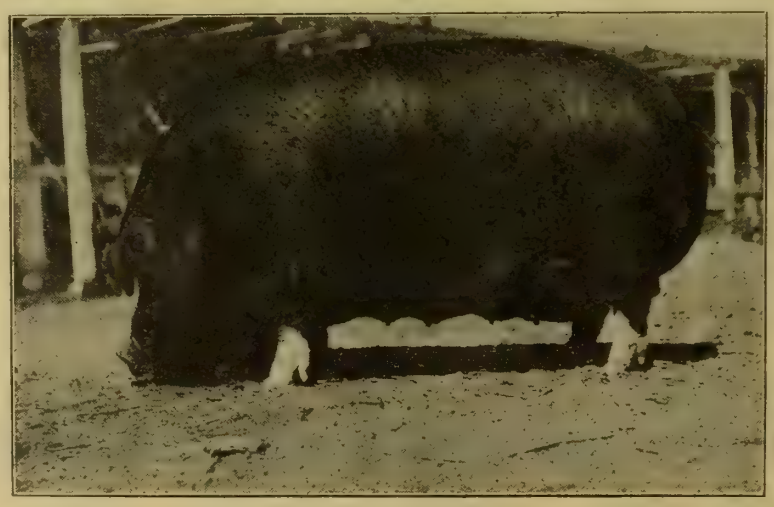
Champion and grand champion Sacramento, 1916; second at San Francisco, 1915. He is a half brother of Banker's Boy, my great boar that won first at San Francisco, and which I sold to Anita Baldwin for $1000.

Herd Boars

I have five distinct strains on my farm, each headed by a boar that is of championship stock. You can pick from my herd just the blood lines and breeding that you need to start or add to your herd. I can at all times supply your needs at prices that you can afford to pay.

Visitors Welcome

My farm is located near Hanford and I shall be glad to welcome you and show you as fine a herd of Poland-Chinas as there is in the state. COME AND SEE.



MISS BEAUTY

This sow was the champion at San Francisco in 1915 and champion at Sacramento in 1916. Her sire was Hustler, who was first under six months and first in young herd at the International Stock Show, Chicago, 1912. Her dam, Black Beauty, won first in 1909 at Sacramento, at Oregon State Fair, at Portland, and at the A.-Y.-P. Exposition, Seattle.

Breeding Sows

Every sow that I keep for breeding is of as high a quality as the boars to which I breed them. The result is to be seen in large litters of strong, active pigs that start right and grow rapidly into the fine prize winning kind of hogs. The kind you want.

Foundation Herds

I can furnish foundations of unrelated strains, all of champion and grand champion stock and shall be pleased at all times to figure with anyone on costs. This is the way to START RIGHT.

M. Bassett

HANFORD -:- -:- **CALIFORNIA**

Imperial Valley's Largest Stock Ferm

Written for California Cultivator

IT is claimed one acre of best Imperial Valley soil will produce two or three crops a year. There are few places where the soilwill do that.

The Timken Ranch Company, El Centro, is developing several thousand acres on their seven different ranches. We saw the second crop of corn being taken from one field in 1916. The company's ranches are located in different parts of the valley. One of the largest and finest is near Brawley, another at Heber, one near Imperial, and the remainder in the rich Holtville vicinity. Every one of these ranches had to be leveled and checked, fences strung, buildings erected, silos put up, and a fortune invested in implements and live stock.

It can be imagined what a man-sized job it was to put these vast properties in running order, and after two years of effort the concern is just getting fairly started. The management of this company is looked after by Mr. C. O. Bullis, who has personally supervised the work. Mr. Bullis has enough energy to satisfy two ordinary men, but he needs it to get the results he has accomplished in such a short time.

They raise almost everything on the Timken ranches that is raised elsewhere in the valley. This year they had hundreds of acres in cotton and long staple worth 24 cents per pound and short staple worth 18 cents brought in a nice revenue. Thev have many acres planted to grapefruit and lemon trees, dates, ornamental trees of many varieties, etc., but the principal crop, the headliner so to speak, on the Timken ranches is live stock.

Large bands of sheep are pastured every year. They are brought down from the Arizona and New Mexico ranges and fattened and lambed in the valley. Finished off on grain these sheep make a fine quality of mutton and are much sought after by the packers. One band of ewes lambed two crops the last year on a Timken ranch.

The pure bred live stock includes Berkshire, Duroc-Jersey and Yorkshire hogs, Holstein cattle, and jacks. These herds are distributed on the different ranches. The three young Holstein herd sires were purchased from A. W. Morris & Sons' Inc. herd during the latter part of 1915. They were only calves at that time and have since filled out and are about as fine a trio as can be found in the state.

Goldstone Sir Alcartra Pietertje 169206 is the best show type of the three. He won grand champion honors at the Imperial fair 1916. Segis Pontiac De Kol Colantha 169205 is a son of the senior and grand champion Morris bull at California state fair last year.

Aralia De Kol Pontiac Dutch 174906 has the best breeding on his dam's side especially of the three bulls. He is out of a 24-pound three-year-old and her dam has a 30-pound seven-day record. Four of his dams average 27.96 pounds butter in seven days and 20,000 pounds milk in one year. His dam's sire has four 30-pound daughters. There are no females in the herd at present as the modern dairy barns have not been completed.

The Berkshire herd was first assembled from purchases made at San Francisco world's fair. The best known blood lines of the breed are represented in the Timken herd.

The Duroc-Jerseys are a wonderful lot, especially some of the more recent importations, which include Model A D, the second prize boar in his class at the National Swine Show last year. He had an easy time outclassing his field at El Centro show in December. He is certainly championship timber.

Has Prince Gelsche Walker Blood

Miss Gelsche Walker Korndyke, new state record junior two-year-old, 23.16 pounds butter, 503.3 pounds milk seven days completed January 10. A daughter of Prince Gelsche Walker, owned by Santa Anita Ranch.

Another shipment of fine Berkshires just arrived from the Elmendorf herd in Kentucky. This new blood will add materially to the quality of the herd.

Probably by the end of the present year the preliminary work on the various ranches will have been completed and then the live stock which has been gathered together will have free and unhampered opportunity to expand. So far, the most important matter has been the completion of the many buildings, laying out fields for crop planting, etc. Of course the live stock has increased but it has been a market proposition strictly. In the future more attention will be given to the pure bred end of the business.

Dr. W. O. Johnson, Holtville, has recently brought in some high class registered Holsteins which together with his Hollywood bred bull makes Mr. Johnson a fine foundation. Some of the heifers came from Frank Guerin, W. J. Higdon, Miss Holdridge and the Rowles herd near Modesto. Several head in this shipment got in the money at the county fair.

S. T. Marshall, Imperial County, is one of the most enthusiastic stockmen in the valley. Mr. Marshall deplores the present movement in cotton as he thinks too much good alfalfa is being plowed up and planted to cotton for the good of the community. He has brought probably more pure bred hogs into the county during the past five years that any other one man.

Ultman and Son, Imperial County, have over 500 head of pure bred Duroc-Jerseys. The valley is a Duroc stronghold and ships many thousands to market annually.

Peter Hovely, Imperial County, is a breeder of registered Holsteins. His herd is not very large but of strong breeding.

Berkshires

I have culled my herd of Berkshires down close until there remains but a dozen head of strictly high class breeding stuff. If you want to get a few fancy pigs sired by a son of Rival's Champion's Best let me know at once, as they won't last long.

Shorthorns

Headed By

Royal Archer Sultan

By Archer, he by Scottish Archer and out of Royal Blossom, a granddaughter of Whitehall Sultan. A photograph of this bull and a group of cows is shown elsewhere in this issue.

Have been breeding Shorthorns since 1889.

Let me price you the only two young bulls I have left from the 1916 crop or come and look them over.

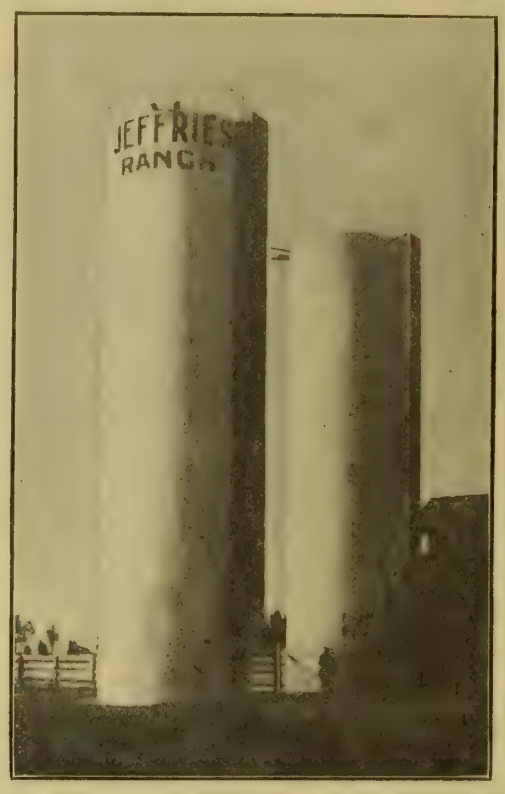
Monolithic Reinforced Concrete SILOS



Twin Silos 14x60 ft.—Capacity 256 tons each, on James J. Jeffries Ranch, Burbank, Cal.

Our concrete Silos are:

Durable---Fireproof---Element Proof

Reinforcing is the reason.

Are not built of pieces and can not go to pieces.

A few names of prominent stock raisers in Southern California using our concrete silos:

JAMES J. JEFFRIES
EDGEMONT HOLSTEIN FARM
ADOHR STOCK FARM (Adamson Corp.)
PELLISSIER HOLSTEIN FARM
WELDON DAIRY RANCH, Tulare County
FRAMPTON BROS.
McGRATH RANCH
LA VEGA RANCH

We also sell

Redwood Stave Silos

For the dairyman who has a small herd or rented land or who does not desire the greater initial cost of a concrete silo, we recommend the ARTESIA REDWOOD STAVE SILO. We build them of highest grade clear redwood lumber fitted with Easton patented doors and anchors. They stay ROUND.

Some well known breeders using our Redwood stave silos:

BETTINGER RANCH
CARVER RANCH
FLOOD RANCH
BROUGHER RANCH (Orange County)
MARTINEZ RANCH
BRICE RANCH
ESTRADA RANCH
FOGLER RANCH (San Bernardino)

We will assist you in working out your feeding problems.

We have erected more silos in Southern California than all other companies combined.

A New Guernsey Dairy for Los Angeles County

Written for California Cultivator

AS the demand for the highest grade milk increases in the large cities plants where certified, special or guaranteed milk is produced, are becoming more numerous.

The production of this high grade milk is an interesting and fascinating business. There is no limit to the expense of buildings and equipment. The majority of certified dairies are built and operated at enormous expense, and often they are both impractical and unprofitable.

The plant which the Adamson corporation is erecting at the present time out on the Ventura road, Los Angeles, is being built along modern, sanitary and practical lines. There will be dairy and calf barns, creamery plant, refrigerator, etc. There will be comfortable quarters for the men and other conveniences, but the owner is going to produce guaranteed milk at a profit and in order to do this and at the same time put in a plant that will compare favorably in every way with others of its kind, every unnecessary item of expense will be eliminated. Mr. Adamson wishes to have a dairy and buildings a little different from

Imperial Valley Junior Champion Guernsey

the average in that it can be reproduced by anyone either on a larger or smaller scale.

Guernseys are the breed of cattle which Mr. Adamson decided upon. The first unit of fifty cows will be bought and installed as soon as the buildings are completed, which will be some time in the early spring.

The Adohr Stock Farms are ideally situated in every respect. The Los Angeles market is but 20 miles distant. The Ventura highway runs through the property, city light, power and water will be used, and other facilities are of the best. In short this farm will be a credit both to its owner and the community.

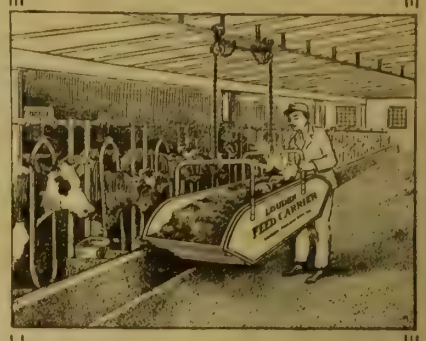
James J. Jeffries, Farmer

Written for California Cultivator

WITH the same energy and ambition which marked his entire career in the boxing world a few years ago, James J. Jeffries has recently entered a new field of endeavor, that of farmer and stockraiser. As the Jeffries ranch is located near Burbank and within 40 minutes ride of Los Angeles, the value of the land made it imperative that Mr. Jeffries should stock the place with dairy cattle. With this in mind the owner commenced looking around for a herd of purebred cattle. He was a conspicuous figure at all the big auction sales of Holsteins in Southern California last fall and rarely failed to bid in the best animals offered. At the Rio Vista sale he was one of a half dozen bidders for the great young bull, King Segis Pontiac Jannek, a son of King Segis Pontiac, a bull that sired more high priced bulls than any other sire of the breed. One of his sons sold for $50,000, another for $35,000, and one four months old calf for $20,000. Jannek is out of a 29.71 pound dam and is considered one of the most promising young Holstein sires in the state.

The Jeffries place consists of over 100 acres. The owner is building a beautiful country home of the low, Spanish mission style of architecture. One of the features of the unique house is an enormous fireplace built in the center of an outdoor court where barbecues can be given. The whole scheme of the building is to make an attractive homelike place where the innumerable friends of the former heavyweight boxing champion

QUICK FEEDING—Without The Waste and Labor



Why hitch up a team twice a day to feed the stock, or make innumerable trips with a wheelbarrow?

With a Louden Overhead Feed Carrier you can carry at one trip enough dry feed or ensilage to feed from thirty to forty head of cattle. There's no waste of feed, no wasted effort, and the feeding is done in half the time required by any other method.

We have Louden Feed Carriers in various styles and sizes, at a wide range of prices that puts them within easy reach of every barn owner.

We have a carrier suitable for YOUR barn, and we'll guarantee it to earn its purchase price again and again in its saving of time, labor and feed.

Ask us for Feed Carrier booklet and prices.

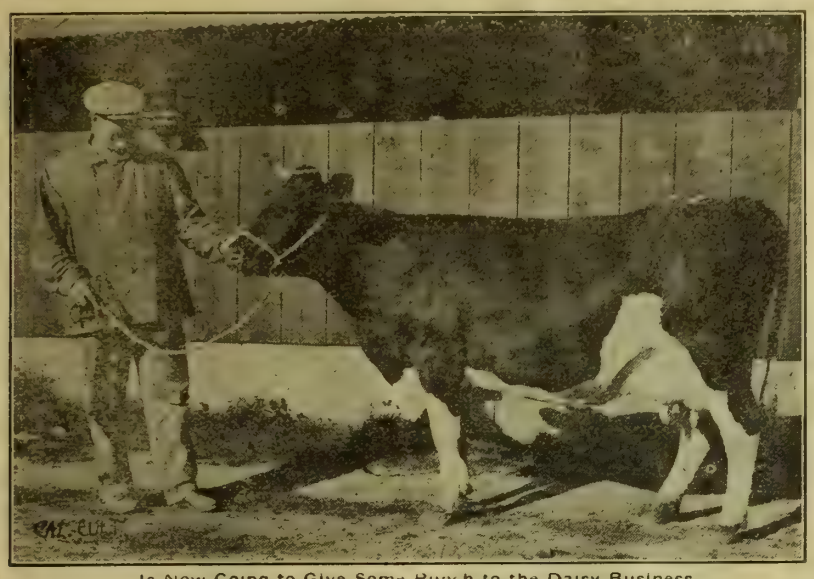
Dixon - California

can be entertained and made to feel at home.

Almost any day of the week, and particularly on Sundays, the Jeffries ranch is overrun with visitors. Mr. Jeffries' keenest pleasure is to guide the visitors around the farm and tell them about his cattle, how much milk he ships into the city every week, how low the bactera count is kept, etc. In conversation with the writer a few weeks ago he expressed himself as determined to have a herd of Holsteins which would make big butter and milk producing records, and a herd that would compare favorably with the best in California. He realizes that it will take some time to found the kind of a herd he wants, but that will not deter him. "This is the real life," he said as we walked through the big barn. "I rarely go into town any more and have so much more to interest and amuse me here than I could ever find in any city. I think the breeding and feeding of livestock is the most fascinating occupation in the world. It is like an animated picture show here all the time, and I get more genuine satisfaction out of this farming business and take more pride in my farm and the animals than in anything I have yet tried." That tells the story of Jim Jeffries in a few words. The pure country air, exercise, and mental action has brought back the "silk" to the great muscles which for years were the marvel of the sporting world. The "gym" on the place is put to daily use, as Jeff takes as much pride as ever in his physical condition. But the largest part of each day is taken up with the livestock that is at once his hobby and his work. Ted Cameron, a Davis boy, was recently secured by Mr. Jeffries to manage the dairy herd, and judging from appearances the selection was a wise one. When employer and employee have a mutual admiration for each other, results are bound to be gratifying.



Is Now Going to Give Some Punch to the Dairy Business
Jim Jeffries and one of his favorite Holstein-Friesian Cows.

A farmers' union in Stanislaus County has this season shipped five carloads of hogs to market, saving $50 to $125 on each car over prices paid by local buyers.

— FOR SALE —
Three Highly Bred Holstein Bull Calves

These young bulls priced right to move quickly; must have room.

No. 1 Born September 4, 1916

Sire: Prince Gelsche Walker, the $12,500 bull. Dam of this calf has record of 25 lbs. butter, 625 lbs. milk 7 days; 814 lbs. butter, 19,272 lbs. milk 1 year. The first six dams of this calf average 28.47 lbs. butter in 7 days.

No. 2 Born September 27, 1916

Sire: King Veeman Pontiac Hengerveld, who is a son of King Segis Pontiac Alcartra, the $50,000 bull and from a 29-lb. daughter of Sir Veeman Hengerveld. We just finished testing the dam of this calf, she making 27.78 lbs. butter 7 days as a three-year-old. First five dams of this calf average 30.2 lbs. butter in 7 days.

No. 3 Born July 28, 1916

Sire: Segis Pontiac De Kol Burke, who is a son of Riverside Sadie De Kol Burke, who has a record of 2065 lbs. butter, 54,808 lbs. milk in two years. Dam of calf has record of 823 lbs. butter, 19,439 lbs. milk in one year.

Our herd consists of 120 females headed by the two young Sires;

King Segis Alcartra Abbekerk, whose sire is King Segis Pontiac Alcartra, the $50,000, bull and whose dam is a 30-lb. four-year-old daughter of Tidy Abbekerk Prince, who has eight daughters above 30 lbs. and one 40-lb. granddaughter. The first eight dams of this bull average over 30 lbs. butter 7 days.

King Segis Alcartra Prilly, sired by King Segis Pontiac Alcartra, and whose dam is a 30-lb. four-year-old daughter of the great dam Prilly Princess, who has two 30-lb., one 29-lb. and one 26-lb. daughters—next dam the great foundation cow Prilly, who holds the world's record for six highest A.R.O. daughters. The first six dams of this bull average over 30 lbs. butter 7 days.

Fontana Land Company has the Largest Swine Breeding Plant in the West

Written for California Cultivator. By F. F. Stonerod

PIGS as far as the eye can reach; black pigs, red pigs; dozens of permanent buildings; farrowing houses by the score; a watering trough a half mile long; hundreds of acres of pasture, with a self feeder that "works" in every one; these are but a few of the wonders to be seen on the Fontana Land Company's vast pork making and breeding farm on the state highway between Los Angeles and San Bernardino.

Certainly "pigs is pigs" on this ranch. Mating some three or four hundred pure bred sows, and about a thousand grade sows twice a year is some job. Keeping tab on the pedigrees of this vast army of pure bred pigs, and looking after the farrowing, feeding and marketing of the other thousands of grades is enough to make one dizzy to contemplate the task.

There are two different breeds of hogs raised at Fontana, Berkshires and Duroc-Jerseys. During the latter part of 1916 the well known firm of Peters, Lamson and Walker transferred their fine herd of Durocs from their Imperial Valley ranches to Fontana and assumed charge of the entire swine department. This was a keen business stroke on the part of the Fontana people, for they got not only one of the very highest class lot of purebred Duroc-Jersey herds in the state but the services of L. L. Lamson and R. K. Walker, two highly efficient young breeders who received their training at such agricultural schools as Iowa and Illinois. They are believers in the theory that a well fed pig is the cheapest pig to raise regardless of the price of feed (always granting that the killers will pay a fair premium for a hard finished hog). Feeding ground milo, cocoanut meal, sour milk and tankage these days is a rather expensive proposition but it is about as cheap as trying to market alfalfa or milk fed hogs at a two cent less price. The hogs which Fontana sends to market are the real thing. The packers cannot put up the cry that they are not finished, for they get a grain ration from the time they are old enough to walk till they hit the shambles. They do get a premium over the market but that premium is not as large as it should be.

The system for handling the hundreds of tons of grain at Fontana is a splendid one. Grain is dumped into a hopper at the ground level, taken up to the top of the elevator on a belt carrier and dropped into enormous bins. When ready to be fed the carrier system is reversed, the whole grain being lifted from the bins and taken overhead where it is dropped into the hopper which lets it down to the grinding machine. The number of pounds of each different kind of feed in the ration fed is determined and the mixture is then taken to the self feeders in the pasture lots by wagon or motor truck. A feature at Fontana is the use for roughage of pomace, or grape seed residue, from the wineries adjacent to the ranch. The pigs seem to like this feed and can be seen nibbling at it all day long.

Two railroad lines run through this property, which makes the loading of market stuff unusually convenient. Mr. Lamson told the writer that the shrinkage on the last shipment of hogs to Los Angeles was not one per cent. That statement shows how well the hogs are finished.

The watering devices are really of the best imaginable. A little narrow cement trough about five inches wide on the top runs through the feed lots. The water runs by gravity constantly and is fresh and available at all times.

The California Duroc fraternity is already familiar with the quality of the Peters-Lamson-Walker stock. They bred some fine stuff for several years in the Imperial Valley and have recently added some Eastern show winners to the herd in both boars and bred gilts. Next year they will probably have a string ready for the fair circuit. Looking over a hundred or more smooth, blocky gilts in a Fontana field a few weeks ago the writer was struck by the uniformity and evenness of the bunch. Surely these gilts bred to any one of the many boars on the ranch will farrow a great lot of pigs.

The Berkshire herd consists of nearly 100 head of pure bred sows and gilts. Ames Rival 116 is probably the best individual sire in the herd, although there are several youngsters which are promising. One of the best sows is Kintyre Lady 5th a half sister to the sow Santa Anita Rancho bought at the P. P. I. E. for $800.

Seeing is believing, and a visit to Fontana is worth while. To breed and properly care for 15 or 20 sows and their increase is no small undertaking. To look after over 1000 sows and their increase is herculean, but it is being done at Fontana and done well.

There are 18,000 acres of land in the tract and over 5000 acres are in citrus fruit, mostly oranges. Livestock is only one department of the business all of which is under the able management of Mr. A. V. Miller.

Bunch of Duroc-Jerseys

Pure bred Duroc-Jersey gilts on the Fontana Ranch. The 1916 crop of market hogs on this ranch is expected to exceed 10,000 head.

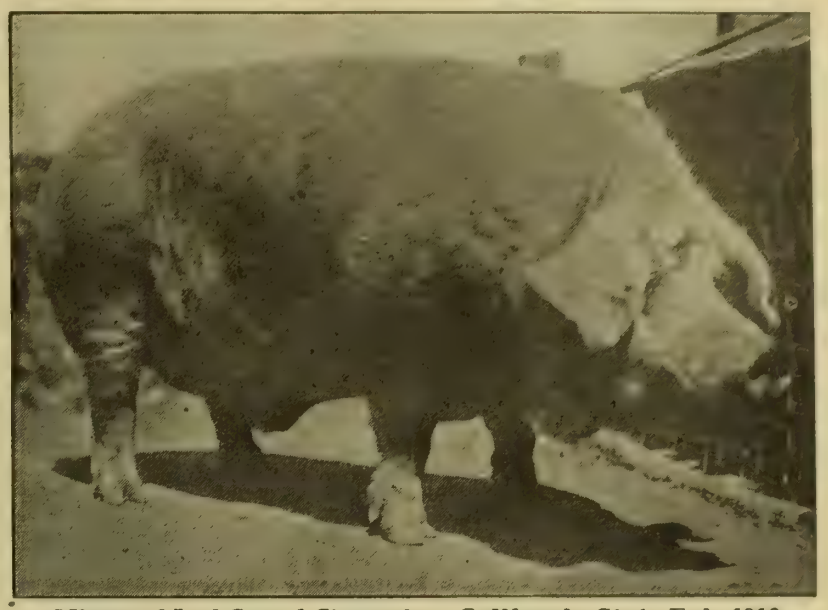
J. D. Huston, Imperial County, has one of the largest herds of pure bred Jerseys in the state. Mr. Huston ships sweet cream to the Los Angeles market and converts a large part of his raw product into a fine quality of cheese. There are over 100 head of cows and young stuff on the Huston place.

J. L. Peck, Imperial County, breeds registered Duroc-Jerseys. He is one of the best posted hog men in the valley. At the recent county live stock fair Mr. Peck captured a large part of the prizes, especially on young stuff.

W. A. Thompson, Imperial Valley, is another well known Duroc breeder in the South. He has over 100 head of brood sows at present and breeds mostly for market purposes.

The Billiken Herd

of Prize Winning Chesters



Missouri Lad Grand Champion, California State Fair 1916

No herd carried away more ribbons at the 1916 California State Fair than did the Billiken Herd. Grand champion boar and grand champion sow; first in get of sire and first in produce of dam, 13 firsts, 9 seconds, 2 thirds, one fourth and one fifth. The best and most popular Chester blood lines are represented in this herd. Both sexes and all ages for sale. Cholera immune and free certificate of registration with every animal sold. Write for Booklet, "Chester Whites."

Oak Grove Dairy Farm, Woodland, Cal.

Dear Sirs—Am pleased to advise you that "Masterpiece Artful Stumpy" duly reached here well and contented on the 2nd inst. I am well satisfied with the sow. She is of excellent conformation and I consider her a credit to you. She is a good advertisement for you. I shall not hesitate to recommend you. Thanking you for your good service, I am

Yours very truly,
F. G. KRAUSS.

Oak Grove Dairy Farm, Woodland, Cal.

Dear Sirs—The gilt made a quick trip. Arrived in fine condition the morning of the 22nd. Have delayed writing as I wanted to size her up and watch her actions. Am well pleased with her—believe she will develop into an A1 brood sow. Will grow her out to the best of my ability. Her head suits me O. K. and mated with Winona Masterpiece Champion the pigs should have dandy heads. Am expecting some fine, growthy pigs. Will let you hear about how she grows out and about the pigs. Very sincerely,

A. N. BLACKMER.

We have a limited number of extra fine, Spring of 1916, open gilts. These are all daughters of Artful Masterpiece 110970 and Improver B 181000. Artful Masterpiece was Grand Champion California State Fair 1912 and 1913. Improver B was Grand Champion at the State Fair 1914. These gilts are the growthy, straight, good boned, typey kind; just the kind to add to your herd. Write to

Oak Grove Dairy Farm Woodland California

HOGS

Smith's Poland-Chinas—Sows and gilts bred to Joker, first prize boar at Wisconsin State Fair 1915. These sows and gilts were sired by Iowa Wonder, who is a son of the great A Wonder, the most celebrated Poland-China boar living or dead. Litters from this mating are the best I have ever seen anywhere. Prices low, quality considered. Will sell one or a carload. As a special inducement each purchaser will be given a year's subscription to the American Swineherd, the best swine paper published, and a copy of the Handbook on the Sow, also a copy of the Pig Feeders' Manual. Geo. A. Smith, Corcoran, Cal.

Grape-Wild Farm Berkshires — World's Fair Grand Champion Grand Leader 2nd heads our herd, not only himself a champion but the sire of champions. At the 1916 California state fair his daughters won all of the senior sow classes including the grand champion sow. At the 1916 Oregon state fair a Grand Leader sow was junior champion. We are offering a number of choice boars of exceptional breeding and are also booking orders for fall pigs. A. B. Humphrey, Escalon, San Joaquin Co., Cal.

Make Big Money with our Big Type Poland-Chinas. Smooth, easy feeders that make greatest weight in shortest time at lowest cost, topping the market at 225 lbs. in 6 months 300 head, both sexes, all ages, reasonable prices. Best Eastern blood lines. Satisfaction guaranteed. Ranch in Tulare County, but address owner, R. H. Whitten, 610 B. Security Building, Los Angeles.

Billiken Herd of Chester Whites—The big prize winners at the 1916 California state fair. The breed that makes money for the rancher and dairyman. Have 4 nice young service boars left and 20 young open gilts that will be bred as desired by buyer. Write for the Chester White booklet that tells all about them. C. B. Cunningham, Mills, Cal.

Poland-Chinas—Twenty good gilts and three 2-year-old sows for sale. Either sired by or bred to I. B. A. Wonder, reserve champion at P.P.I.E. A few good young boars ready for service, sired by I. B. A. Wonder. A fine lot of fall pigs. I please you or refund your money. W. A. Young, Lodi, Cal.

Large Yorkshires—Choice spring boars, gilts and weaned pigs from champion sow P.P.I.E. or from breeding of champion boar and sow Sacramento, 1916. If you see them grow you will like them. Riverina Farms, Paradise Road, Modesto, Cal.

Superba World's Grand Champion Poland-China boar and one of the greatest sires of the breed. Spring boars ready for service, also few sows bred to this noted sire, reasonably cheap. Rough's Greenfields, Arlington Sta., Riverside, Cal.

50 Bred Sows and Gilts, 50—Of true Berkshire type and quality; bred to grand champion boars are included in our private sale list now ready for mailing. Write for it today. Silver Birch Farms, Box C. C., Newport, Wash.

For Exchange or Sale—Registered Berkshire boar, not quite two years old. Fine type and splendid breeder. Will exchange for Berkshire boar of equal merits. Want new blood. W. M. Chambers, Miraflores Ranch, Anaheim.

Choice Registered Berkshires — Extra fancy and growthy August boars and sows $25 each. Bred sows, service boars and gilts at reasonable prices. W. H. Waugh, Riverside, Cal.

Registered Poland-Chinas, prolific, fabulous, profitable, porkers. Choice young boars now ready for service, $25 each, weanlings $15 each. Dr. J. A. Crawshaw, Hanford, Cal.

Fine Means deep well, double acting pump, good for 50 inches, $300; plunger pumps, all sizes, brass cylinders, pipe, rods to suit; 1½-hp. International engine, $25; 2-h. Fairbanks, like new, $55; 4-h. Oriental, $45; 6-h. Western, $79; many other sizes gas engines, power blower, horse powers, winches, sundries. Material as represented. We buy tools if in good shape. Trade us what you don't want for what you do, with little cash. DEMMITT CO., UPSTAIRS 120 N. Main. YARDS 816 Yale, Los Angeles.

For Sale—Rumley Tractor, 16 h. p., little used. Would consider trade for team of mules, or $800 cash. A. W. Leichtfuss, Orange, Cal.

For Sale—25 h. p. Commercial engine; excellent condition. Replaced by electricity. Harry Crowe, Tulare, Cal.

OPPORTUNITIES FOR STOCK RAISING IN ANTELOPE VALLEY

There are many sections in Southern California where land values are not prohibitive for the man of limited capital. One of these is the Antelope Valley. Lancaster is the principal town and is just 80 miles from Los Angeles. This valley has been on the up trend ever since it was demonstrated that water could be secured at a reasonable cost. As a matter of fact the soil is very similar to the soil of the country which lies to the east of Los Angeles, and where land values have risen steadily with the rapid growth of population. As a livestock or fruit proposition the Antelope Valley offers attractive possibilities. Any district which is within 100 miles of a center of population and has adequate railroad facilities is bound to be settled and developed rapidly once its advantages are widely known. Alfalfa, grains and grasses all thrive in the Antelope Valley. With intelligence a 200-pound hog at seven to eight months of age can be finished and marketed as cheaply as it can be done anywhere, and the short distance from the market saves many dollars to shippers as the per cent shrink on finished hogs is nominal on an 80-mile haul. There are other parts of the Southwest where equal opportunities are to be found, but the point is that with the ever increasing growth of our population and the corresponding decrease in livestock production and its by-products, every available acre of arable land must sooner or later be cultivated and cropped.

TESTING SHOWS WORTH

The Henderson Ranch Company has sent us a list of the last eight cows freshening on the ranch and from it we note that there are some remarkable showings of butter fat percentages. There are also some good seven-day productions.

Bessie Oak Segis, tested at 2 years, 11 months, 18.61 pounds butter from 290.1 pounds milk in seven days. Average per cent fat was 5.13. This cow showed the highest percentage of any, remarkable for a Holstein, proving that butter fat can be bred into a cow.

Other producers on the ranch with their seven-day tests are: Sunnyslope Anna Prilly, two years, eight months, 13.93 pounds butter, per cent of fat was 3.1. Cleopatra Walker Colantha, two years, nine months, 15.10 pounds butter; per cent fat 3.24. Margill Pauline Pet, six years, 21.01 pounds butter; per cent fat 3.36. Nina Walker Pauline, two years, five months, 17.66 pounds butter; per cent fat 3.56. Daisy Oak Segis, four years 10 months, 20.5 pounds butter; per cent fat 4.02. De Kol of Glennaire, two years, five months, 18.05 pounds butter; per cent fat 3.82. Susie Fayne Walker, heifer, seven and one-half months after calving, 13.30 pounds butter. Lorenzo Clothilde Hengerveld, four years, 18.26 pounds butter; per cent fat 3.28.

THE WINNING WAY

If you put a little lovin' into all the work you do,
And a little bit of gladness, and a little bit of you,
And a little bit of sweetness, and a little bit of song,
Not a day will seem too toilsome; not a day will seem too long;
And your work will be attractive, and the world will stop to look,
And the world will see a sweetness like the tinklin' of a brook,
In the finished job; and then the world will turn to look at you
With a world's appreciation of the thing you've found to do.

Just a little bit of lovin' and a little bit of song,
And some pride to sort of make it straight and true and clean and strong;
And the work that you're a-doin' pretty near before you know
Will have set the world a-talkin', and you'll see that you have done
More than you had dreamed or hoped for when the task was first begun;
And you'll find the bit of lovin' you have put into the same
Has come back to you in lovin', and come back to you in fame.—Exch.

HERE'S TO CALIFORNIA
By Kathleen Norris in American

(Concluded from last week.)

THERE was a great year when the output of wheat was more valuable than that of gold. But gold was a first love with the early Californians, and they followed the gold. Wherever the feverish rumor flew, they hurried after. They left homes and wives and children to flock into the mountains, and many of them never found anything but thirst and hunger and left only their bones to tell the story. Meanwhile the city property that in itself was worth a gold mine, or the untilled fields that were some day to feed half the world, lay neglected. Even after this time gold played an important part in the history of the state. In 1870 everybody in San Francisco was buying silver stock in the Nevada mines. One of these mines produced three hundred million dollars' worth of ore in eighteen years! The mere figures were enough to drive sober reason from one's head! Car conductors, sober young wives, little seamstresses, rich and poor, wise and unwise, they flung whatever they had madly into the game, indeed they flung more than they had.

Nothing else interested the city, while this mad fever burned it. Strangers talked eagerly and nervously in the streets, today's beggar was tomorrow's millionaire. The terrible question of holding or selling turned men's hair white and broke them on the wheel. This one, hitherto respected, successful, happy, put a shot through his brains; that one reeled home and sat for dazed hours in the bay-windowed parlor and looked mutely at the silk-clad, confident wife and the pretty daughter, just freed from high school and the retinue of sympathetic maids—ruined, and more than ruined. Even today in the city a busy young stenographer or a school teacher will point you out a business block teeming with prosperous life, with the philosophical smile that is characteristic of the Californian: "That belonged to my father before the silver slump!"

This was long ago—for California. For we measure phases by decades rather than by centuries: 1870 is buried in the past; I have seen New England villages where the Revolution seemed nearer, and the Civil War only yesterday. Since 1870 so many things have happened to California that she may well regard vigilante committees, land quarrels and gold fever as the impulsive mistakes of her girlhood. The idle, glowing flower garden, humming with bees, that lies between her mountain chains, the imperial forests, the empty harbors and untouched fields, have welcomed the world in the last 40 years, and the world has poured in.

California is the most cosmopolitan of all the states. She has not only all the nationalities of Europe, but she has the Oriental races, Mexicans, Filipinos, and Southern and Central Americans walking her streets. She has citrus plantations and oil wells in the south, she has every ordinary farm product—fruits, vegetables, cattle, sheep, swine and poultry, wheat, barley and corn—in her great central valleys; she has mines of all sorts and colossal lumber interests in the north; she has an enormous wine industry, and she provides not only herself but half the Union with salt and pepper and spices. And within a few miles of each other the humble potato and the aristocratic alligator pear, or the finest grapefruit in the world, are found growing.

Even the dispassionate outsider must admit that California is economically the least dependent of the states, a fact that one happy memory of mine substantiates. For, years ago, I was a small visitor on a thousand-acre ranch which supplied every human need, except, the mistress used to laugh, "the bones for my corsets." Oysters, honey, leather, kerosene, cheeses, homespun, wine, raisins, bricks and flour were all placidly produced at need; there were clear water springs, and even a delicious geyser of what we called "soda water."

This was, of course, only an old farmer's whim. Yet it is possible today, on 40 acres of land, to have a livelihood, a bank account, and a home in any one of a hundred fertile canyons There are little families there raising a few peaches and a few calves and a few pigs, sowing a few acres of alfalfa (three or four crops a year!), renting out the team to neighboring farmers at three dollars a day, sending a few pounds of butter to market every week, and perhaps drying a few hundred pounds of apricots every spring—who spend during the year perhaps one tenth of the money they make. There are splendid schools all throughout the state, and although a too kindly climate encourages the building of rather unsubstantial wooden houses, and one laments the contrast to the beauty of New England villages, yet the gardens atone for everything, and the wide-spread content and thrift more than make up for the lost beauty.

Socially, of course, the cities are still suffering from growing pains. We are still nouvelles arrivees, unsteady on our feet, uncertain as to background. Many and mysterious were the causes that brought the early settlers to the last frontier, and many and mysterious were the exigencies they met in the days of settling. Younger sons and remittance men came from abroad, the impoverished South after the war sent other hundreds swarming westward, and always-shrewd New England claimed her share of the new find. There was some intermarrying with the old Spanish element, and there was a small but steady influx from Hawaii, clergymen's families, or dark-eyed girls of mixed blood, who came up by sailing vessel to make a part of the city. Fortunes, in the early days, were more quickly mended than manners, and the heart of many a social leader must have quaked when the conversation turned upon lineage.

Yet of all the conflicting elements there has been welded a population worthy of the miracle state. California has a definite personality, a personality unmistakably courageous, hospitable, broad-minded and independent. She is unbound; she welcomes innovation; she holds an imported convention guilty until it is proved innocent. She rises to the horrible emergency of earthquake and fire only a little less buoyantly than she turns her energies to the creation of a record-breaking exposition.

San Francisco, dragging its trunks over miles of hot pavement, moving its cooking stoves to the windy edge of the sidewalk, crashing and tumbling in a smother of dust and ashes about its own ears, was still laughing and confident San Francisco. She was no more laughing and confident when, only nine years later, she flung her doors open to the world, and close to the blue edge of the bay and under the incessant blue of the approving skies was hostess at the most beautiful of all the great fairs. For ten months the cream and blue and apricot and crimson buildings swarmed with visitors, the flags of all the countries in the world blew in the sun, the Tower of Jewels twinkled and glowed, and the great transplanted trees threw a delicious shade across the white roadways. And when the fair was over, California was not tired, not discouraged, not even in debt.

She found that her fair was the first that had ever paid for itself, and so she had another celebration for that.

She celebrates everything, does California. And so tenacious is her loyalty, and so eventful her history, that scarcely a week passes without its anniversary and its jubilant commemoration. Ocean fogs pour over her from the blue Pacific, trade winds sweep up and down her coast cities, and she has a fair rainfall—admitted. But somehow her sons and daughters think of her as always sunshiny, always warm and serene and welcoming, a gracious figure of hospitality, and of giving, between the great desert and deep sea.

CANDIED AND PICKLED FIGS

Recipes Given by W. V. Cruess in His Address Before Fig Growers at Fresno

Candied or Glace Figs.

Figs, because of their texture, size, and flavor, are especially desirable for the preparation of glace or candied products. Candying figs consists in impregnating them with enough sugar in the form of repeated addition of syrups of increasing concentration so that they will finally after a short drying retain their original shape and can be handled much as any other candy. The method in brief is as follows:

Choose figs (preferably Kadota or similar variety) ripe but still firm.

Puncture the fig with numerous holes made by copper or wooden needles. Holes made by toothpicks are satisfactory.

Boil figs in water until tender, but not until soft.

Place in a syrup testing 30 per cent Balling and bring to boil. Pour into earthenware crock and leave 48 hours. Use ordinary Balling sugar tester for testing syrup. (See Circular 146, University of California Experiment Station, on use of Balling tester.)

Drain off syrup and add sugar to bring it to 35 per cent. Heat to boiling and pour it over fruit. Leave 24 to 48 hours.

Repeat this at 40 per cent, 45 per cent, 50 per cent, 55 per cent, 60 per cent, 65 per cent and 70 per cent sugar, allowing 24 to 48 hours between each boiling of syrup.

Leave figs in 70 per cent syrup 48 hours. Remove it. Wipe off excess syrup from figs and spread to dry about one week on a wire screen. The figs are then ready for use or may be coated as follows:

Make a very strong syrup consisting of about four pounds of sugar to one pint of water. Heat to boiling. Dip figs in this quickly and spread out to drain. A coating of sugar will form on the surface. The figs must be packed in rather open containers to avoid mold. Wicker baskets, etc., are suited to this purpose. Dried Smyrna figs, soaked in water till full size, boiled in water until tender, and treated as above give a good glace fruit, the dried Mission and Adriatic did not give such good results.

Sweet Fig Pickles.

A very pleasing sweet pickle may be made from figs, using either the fresh or the dried fruit. The following recipe is furnished by Mrs. A. E. Christie of Berkeley:

The fruit is first steamed or boiled a short time until tender. Then the figs are drained free of water; placed in jars, and covered with a boiling hot spiced vinegar prepared as follows. One quart of vinegar, 2 lbs. of sugar, ½ oz. of cinnamon, and ½ oz. of mace. Grind spices and tie in a muslin bag. Boil spices, sugar, and vinegar a short time and pour boiling hot over the fruit. Add whole cloves to taste and seal jars hot.

HELPFUL THINGS

Written for California Cultivator By Martha

Cornmeal is the housekeeper's friend in many ways. If you have felt hats or any woolen garment you would like to dry clean cover a small quantity of meal with gasoline and apply wih a soft cloth to the article to be cleaned. To clean kid gloves put them on the hands and wash them in the mixture of meal and gasoline as if using water, and they will come out clean, soft and unfaded. There is nothing better than white corn meal for cleaning light colored furs. Lay them out flat, sprinkle plenty of meal through the fur and with the hand rub it well all through the fur, and when the article seems clean, shake and brush until every particle of the meal is removed. To clean the hair without washing, sprinkle plenty of meal through the hair up close to the scalp, then brush it out with a clean stiff brush.

One of the most helpful things in the home is a bottle of boric solution, and this is easily prepared by adding a heaping teaspoon of granulated boric acid to one pint of boiled water. This boric solution makes an excellent gargle for sore throats or a lotion for sore eyes, and there is nothing more healing for burns and for small cuts and wounds as it is a fine disinfectant and cleanser. A little salt added to the boric solution makes a fine douche for catarrh in the head, and the best way to use any solution for this trouble is to put it in a nasal dish and snuff up into the nostrils. One of these dishes can be bought at any drug sore.

There is nothing more helpful in the kitchen than some asbestos mats. You can buy asbestos by the piece and make the mats any shape or size you want or you can buy them ready made. Put one of these mats on the stove under the pan of milk which is being heated for toast, and the milk will become very hot, yet there is no danger of its sticking to the pan or scorching, and boiled milk is indigestible. Place such a mat under the pan in which you cook oatmeal or custard, if you have no double boiler, and save scorched or burned food. An asbestos mat with a cover made to fit, of coarse linen, is handy when you have hot dishes to set on the table, and these covers should be made so they can be easily laundered.

ALL NOTABLES

There is a certain colored man whose last name is Washington. Heaven has blessed him with three sons.

When the first son arrived the father named him George Washington. In due time the second son came. Naturally, he was christened Booker Washington. When the third manchild was born his parent was at a loss at first for a name for him. Finally, though, he hit on a suitable selection.

The third son, if he lives, will go through life as Spokane Washington.

ARNOTT & COMPANY, Inc., 112-18 South Los Angeles St. Los Angeles

In our every issue there are new advertisers. Are you keeping in touch with them?

Millbrae Dairy
Holsteins

For more than a quarter of a century this herd of registered Holsteins has been operated as a commercial dairy, and every cow in the herd has been compelled to qualify as an actual profit-maker as a dairy cow in order to hold her place in the herd.

So also has every sire used been compelled to prove his worth as a getter of profitable dairy cows in order to keep his place in the herd.

It is little more than a year since the first official testing was begun in this herd, and the result has been to make official the production of many of our profitable dairy producers. Among other noteworthy features brought out by official testing we have the only family of 30-pound cows yet developed in California.

We are now offering a few splendidly bred young bulls as follows:

No. 1.—KING PONTIAC PIETERTJE BEAUTY. Born April 16, 1916. Sire: KING PONTIAC MUSA NETHERLAND 89775, whose sire is King of the Pontiacs. His three nearest sires have 440 A.R.O. daughters, 180 A.R.O. sons, and 238 producing daughters, a record not exceeded by any other bull. Dam: MAY BLOSSOM OF MILLBRAE 212662. Official records as a senior 3-year-old, 606.1 pounds milk and 24.95 pounds butter in 7 days, 2387.1 pounds milk and 98.76 pounds butter in 30 days. She is a daughter of a 30.88-pound cow and has a 31.86-pound 4-year-old sister. This is a nice typey calf.

No. 2.—KING PONTIAC NETHERLAND BARRILOS. Born March 18, 1915. Sire: KING PONTIAC MUSA NETHERLAND 89775. (Same as No. 1). Dam: SLEEPY BARRILOS OF MILLBRAE 161752. Official records 678.4 pounds milk and 30.88 pounds butter in 7 days, 2923.2 pounds milk and 122.56 pounds butter in 30 days. A wonderful producing cow who has a 31.86-pound 4-year-old daughter and a 24.95-pound 3-year-old daughter. Bull is a good individual.

No. 3.—RAG APPLE CLOTHILDE KORNDYKE 2ND. Born March 12, 1916. Sire: RAG APPLE CLOTHILDE KORNDYKE 105151, a son of Sir Rag Apple Korndyke, who is out of a 36-pound daughter of Pontiac Korndyke. Dam: GLADYS OF MILLBRAE 214830. As a senior 4-year-old she made official records of 729.4 pounds milk and 29.35 pounds butter in 7 days, 3064.1 pounds milk and 121.12 pounds butter in 30 days. As a senior 3-year-old she made 509.7 pounds milk and 21.07 pounds butter in 7 days, and 249 days from calving made 285.1 pounds milk and 13.64 pounds butter in 7 days. This is a very typey youngster and fit to head any pure bred herd. His dam is one of our best prospects, and is almost sure to increase her record.

Veterinary

Answers in this column by Dr. Wm. Petrie, 2714 South Harvard Blvd., Los Angeles, are without charge. For immediate mail answer remit $1.00. In writing questions give full symptoms or particulars of injury of animal.

Unsigned communications receive no attention.

Lice

My cows have lice. Is kerosene emulsion all right to use on them to kill the lice and nits? If not please suggest the least expensive remedy you know?—Subscriber, Rio Bravo.

Yes the kerosene emulsion is all right, but do not get it too strong of kerosene or it will remove all the hair. The hair will come in again, but zenoleum will do as well and not affect the hair. Use a teacup of the zenoleum in a bucket of warm water and wet the cow all over. Then put on a blanket until she is dry. Repeat it in a week to get any that may hatch out later.

Urinating Too Frequently

Will you advise as to treatment for four-year-old horse that is troubled with too frequent passing of urine. He feels well and seems in good condition otherwise. He is fed on alfalfa hay alone. The trouble is of several months' standing.—Subscriber, Lancaster.

If the alfalfa hay was cut too green it may be the cause of the frequent urinating. It may be well anyway to change the feed for a short time. Also give this; Iodide of potash two ounces and water enough to make one pint. Give one ounce of the solution in the drinking water once a day. It might be well also to get some ground flaxseed with the oil left in. Make a tea of this by placing a handful in a clean bucket and pouring on a gallon of boiling water. When cool fill the bucket with cold water and let the horse drink it. Give this once a day; it is soothing to the kidneys and will regulate the amount of urine as well.

Indigestion

I have a young cow that is sick and wish to know what is wrong. She lies around about all the time and sometimes grunts when she walks. She is fed alfalfa hay, bran and some rolled barley, but has a very poor appetite. She drinks very little water and for the last week has fallen off half in her milk. Her hair also looks rough. Please tell me what is wrong with her and what to do for her.—Subscriber, Alpaugh.

The word indigestion means a faulty or improper action of the digestive organs on the feed. Usually this is followed by fermentation of the feed and the formation of gasses which causes bloating, but sometimes there is no fermentation and the food becomes dry and hard. This sometimes happens in one of the pouches or organs through which the food passes before reaching the true stomach where the gastric juices are found and true digestion takes place. These conditions cause pain, and the cow will show such symptoms as you describe. She needs a physic. Give the following: Three pounds of epsom salts, one pound of common salt, two ounces of aloes and one ounce of powdered nux vomica. Dissolve it all in two gallons of hot water. Divide into four doses of two quarts each and when cool give the first dose as a drench. Give the second dose in 12 hours and the other two doses 24 hours apart. In the meantime allow the cow all the water she wants to drink but not too cold. If you succeed in washing out the stomachs with this treatment she will probably go on again all right.

Abortion

What is the cause of cows slinking their calves?—Subscriber, Willows.

It may be due to contagious abortion which is due to a germ. Better consult a veterinarian that is near you and have him attend to them for you. It is difficult for one who has no instruments to carry out full instructions that are given in a written article.

Holstein Bulls

Well bred, vigorous, registered Holstein bulls of good type for sale. Steady sales have moved all our bulls of service age, but we have a few unusually good calves to offer at moderate prices.

The McCloud River Lumber Company

McCloud, California

Retained Afterbirth

When the membranes remain in the uterus of a com and decompose, inflammation of the lining of the womb may be caused, and this, with the absorption into the blood of the products of putrefaction, lead to ill-health, emaciation, diminished milk supply, failure to breed, and often blood poisoning and death.

HOOD FARM BREEDING POWDER causes the afterbirth to come away naturally in a few days, and thoroughly cleanses and disinfects the parts, leaving the cow in normal condition for breeding. Write for full information and prices, mentioning this paper.

HAY

Scott, Magner & Miller say under date of January 13:

Receipts this week 1745 tons, last week 1073 tons, the week previous 1330 tons. The market has remained firm and all arrivals are placed without difficulty. Fancy wheat and red oat are in good demand, red oat easily placed at top figures. Stock hay is also in demand and very scarce. The car situation is a little easier. Quite a little time in unloading cars could be saved if railroad companies would spot cars on team tracks promptly after arrival. Several round lots of grain hay have changed hands in country districts at high prices, which would indicate that some dealers are looking for advances in the local market, the market being at least $1.00 per ton higher all around this week. Country trade has been exceptionally good. All sections are ordering hay and reporting good demand owing to the lack of green feed because of cold weather. Alfalfa is in good demand and prices have advanced. Straw is scarce, selling at top figures.

We quote car lots f.o.b. San Francisco.

Citrus Fruit Market

LOS ANGELES, Jan. 17, 1917.

Stormy weather has prevented some harvesting of fruit and this has enabled the cleaning up in the Eastern market, but even there the weather has not been the most favorable. Auctions have shown some averages running below cost of packing and transportation. This, however, is for fruit which has been injured by frost.

The lemon market is in better condition and even the auctions show some very satisfactory sales.

Shipments

Shipments of oranges from Southern California to date since November 1, 1916, 3834 cars, lemons 958, total 4772; to same date last season, oranges 2084, lemons 1140, total 3224. From Central California to date this season, oranges 3790, lemons 123, total 3913; to same date last season oranges 4097, lemons 97, total 4194. From Northern California to date this season, oranges 838, last season 759.

320 Sharon Bldg. - - San Francisco, Cal.

Poland China Boar

"WONDER'S BLUE VALLEY" 255267

Weighed 600 pounds at less than one year old. Won second in futurity and open class at the State Fair in 1916. Sired by "Blue Valley Again"; dam by Rood's A Wonder.

Price $100.00

Also May and June boar pigs, sired by "Cantrell's Ideal," son of the famous "Big Joe". Dams are big type sows of best breeding. Prices $25.00 and $35.00. Write to

NATE HAUCK, - Alton, Humboldt Co., California

Are Your Cows a BURDEN?

Many cows are a constant drag on their owners when they could just as well be good producers—if properly handled.

Don't forget that your cows can get physically "off color" just as you sometimes do. Watch the milk yield; if it is going down without apparent reason, something is wrong with the cow. Overfeeding is likely to make the condition worse; she needs a medicine that will clear up and strengthen her organs of production.

Kow-Kure is making thousands of new friends among the best dairymen every year, because it supplies this great need. It is a cow *medicine*, pure and simple—not a food. It has great curative and tonic powers that immediately act upon the digestive and genital organs and enable the cow to thrive on her natural food. Kow-Kure has back of it twenty years of success in making backward cows profitable and in the prevention and cure of Abortion, Barrenness, Retained Afterbirth, Milk Fever, Scouring, Lost Appetite, Bunches and other common ills.

You can buy Kow-Kure from the best feed dealers and druggists. Sold in 50c. and $1.00 packages.

Elliott-Brant Rancho Guernseys Are Persistent Producers

PRINCESS OF MEADOWBROOK, a six-year-old cow, averaged 40 pounds a day of 5% milk for over a year. This rich milk brought 16 cents per quart, a gross income of $1,168 for the year, or $3.20 per day.

LOIS VALENTINE'S LAD'S LASSIE, a two-year-old heifer, averaged nearly 30 pounds milk per day for a year, producing more in her tenth month than at any time previous. The gross income from the sale of her milk was $842.40, or $2.33 per day.

It cost about 25 cents per day to feed these cows.

Compare these results with those of other herds and breeds.

Elliott-Brant Rancho, - Owensmouth, Cal.

ABORTION IN CATTLE

PREVENTED AND CURED PERMANENTLY
YOUR COWS MADE PROMPT, REGULAR BREEDERS BY
STERILOID

STOP LOSING CALVES

TREATMENT: If STERILOID is used at the first sign of abortion the cow will go her full time and have a healthy calf. If your cows or heifers do not come in season, or fail to get with calf, use STERILOID. Cows get with calf after only one treatment. Write today for FREE BOOK. It explains the causes and symptoms of Abortion and tells how to cure Abortion, and make your cows regular, healthy breeders with STERILOID. Also contains letters from breeders who have used STERILOID successfully.

GUARANTEE: We will refund money in every case when STERILOID FAILS to make good. Price $1.00. Mailed postpaid, in plain wrapper.

The Type We Are Breeding For

Hardy, prolific sows of best blood lines and breeding. Strong, upstanding, prepotent boars. In short the best possible specimens of the Berkshire breed. We plan to do this by breeding large numbers and from them making a rigid selection.

Hamilton City, California

Legal Queries

Louis B. Stanton, attorney, 243 Wilcox Building, Los Angeles, will answer legal queries in this department.
Immediate mail replies cannot be given except where fee to Mr. Stanton is paid. When replies are wished in Cultivator address query to 115½ N. Broadway, Los Angeles.
Unsigned communications receive no attention.

Joint Ownership

If a husband and a wife hold property jointly would a deed of gift of his or her part in the property to him or her, with the understanding that the deed is not to be put on record until after his or her death, be legal and avoid legal procedure? — Subscriber, Lakeport.

In the above case it will be unnecessary for any deed to be given. In view of the fact that if the deed under which you hold title is made to the husband and wife as joint tenants with right of survivorship the one who survives acquires the whole title to the property. All that is needed in such case is to file a petition in the superior court setting forth the fact of the death of the other joint tenant, which is a very inexpensive procedure.

Trespassing Animals

I own 300 acres of land fenced with four strands of barbed wire. Some neighbors on adjoining land persist in raising hogs. I intend now to farm this land. Now what legal redress have I? And what measures must I take to protect myself?—Subscriber, Oakhurst .

It will undoubtedly be true that you would not be required to make a hog tight fence, as you are only required under law to enclose your property by "substantial fence or other enclosure". If your neighbors' hogs then enter on your premises you are entitled to bring action against your neighbor for a sum which will compensate you for all damages sustained by reason of trespass and also for the amount which you have expended in the care of the trespassing animals. In order to secure the payment of this sum you are entitled to hold the trespassing animals, and with that end in view on the filing of your verified complaint you are entitled to have a writ of attachment issued out of the court wherein the complaint is filed, directed to the sheriff or constable requiring him to hold the animals pending the decision of the case. In this form of action you are not required to put up the usual bond or affidavit of attachment, and no animal is exempt from attachment or execution in this proceeding.

Damage from Irrigating Water

Can I collect damages done me by neighbor letting water come on my place?—Subscriber, Fresno.

The more approved rule is that the upper owner of the land is not permitted to discharge waters from his land upon the lands of a lower owner to any greater extent than the natural flow of waters over those lands would have discharged if natural conditions had been left undisturbed. Thus, permitting irrigating water to flow over upon the lands of another would be an actionable trespass.

Community Ditch

We have a community irrigation ditch that runs along railroad fence. All holes on railroad property are constantly filled with water. Is there any law fixing the distance ditch shall be from property line, and in case of wreck would ditch owners be liable to damage or is it railroad's duty to fill these holes?—Subscriber, Reedley.

The duty of keeping the artificial ditch or canal in repair generally rests upon the party who enjoys its benefits. If such party exercises reasonable care and diligence in making such repairs he will not be responsible for accidental damages to another. It is therefore probably true that as between the owners of the irrigation ditch and the railroad the liability would rest upon those using the ditch for neglect in keeping said ditch in repair. As between a person injured and the railroad, the cause of action would lie in the first instance against the railroad, which might be subsequently recoverable against the owners of the property. I know of no law fixing any distance which the ditch should be kept from the railroad line, except, of course, you are not entitled to trespass upon the railroad right of way.

Fence Over Line

I bought a 20-acre place five years ago. The owner of land joining me on the south had built a barbed wire fence before I came here, which was supposed to be on the line between our places, but instead the first post is the only one on the line, the other end post sets three or more feet on my place. What legal steps would you advise to force him to move fence to the line?—Subescriber.

The best method would be to bring ejectment against your neighbor, in which action the true line of the premises could be determined and adjudged.

Contract

Where daughter takes care of parent, what kind of contract may be drawn up as to disposal of parent's property which will assure the caretaker of receiving compensation, justice to other heirs and to the parent? —Subscriber.

A contract may be drawn up providing for a certain stipulated compensation and made chargeable against the estate generally, or against any particular piece of property of the estate. It would be best for you to go to an attorney to draw such contract as such matters have been frequent source of expensive litigation.

Willing Property

In making a will where you want to leave your property to your husband and children should their names be followed by the words "their heirs? Who would get the property at my daughter's death, she now having children? If there were no children would her husband inherit her portion or would it go to my other children?—Subscriber.

The words "their heirs" is required in some jurisdictions in order to convey a fee simple estate. Omitted, an estate for life only is conveyed. That rule has been abolished in this state. If a woman dies, leaving no husband but leaving a child or children, the whole estate goes to such children. If she left a husband as well as children, one-third goes to the surviving husband and the remainder in equal shares to the children. If there are no children and only a surviving husband, one half of the estate goes to the surviving husband and the other one half to the decedent's father and mother in equal shares; if either of them is dead the whole of the said estate goes to the other; and if there is no father or mother then the one half goes in equal shares to the brothers and sisters of decedent. The above applies, however, in the case of a married woman only to her separate estate, the rule being, as to community property that the whole of the community property goes to the husband upon the death of the wife, regardless of whether there is or is not issue.

Homesteading

What is meant by "homesteading" property? What is the advantage and what is the procedure?—Subscriber, Los Angeles.

A full statement of the law of homestead was made on page 100 of the Cultivator of August 5, 1916. A short resume follows: By homesteading property the husband or wife, or both, file a declaration of homestead in the office of the county recorder describing the property upon which they reside at the time the document is recorded. Thereafter that property is termed a "homestead". It is exempt from execution up to the amount of $500, and if made upon community property or upon the separate property of the spouse executing said homestead, descends to the surviving spouse upon the death of either without entering into the estate or being liable for the debts of the estate. In fact, the surviving spouse has practically a joint tenancy, and upon the death of the other may file a petition in the superior court setting forth the death; upon the death being determined the property is decreed to be the property of the survivor.

Use of Ditch

My place is in two water districts, No. 8 and No. 4. A river runs through the place. My main place is No. 8, 93 acres; three acres are in 4. One share of water stock to each acre. The three acres in 4 have always been farmed by a neighbor using water in his own ditch. He has paid me rent. The place has been cropped since 1905. Now this man has sold the place. The new man refuses to let me irrigate my land from his ditch. Will not rent my piece of land neither will he buy it. I have to pay my assessments in 4 just the same. There is no way to get water to this three acres except to get it through his ditch. Will you please answer in your valuable paper.—Subscriber.

Very frequently in cases of these irrigation districts, the several owners of property served by the ditches have a common interest in the water course which serves them, in which case a court of equity would have jurisdiction to adjust and settle their relative rights. It is probably the case in this instance that you have a right to have the water flow through the ditch on your neighbor's land to your own, but it would be necessary for you to examine the records of the irrigation district in that respect. It is hardly probable that you would need to pay an assessment without the right to have the water come to your land.

Repairs to Rented Engine

A hired a gasoline engine belonging to B for a certain sum agreed upon. While A had the engine in operation a certain part of the governing mechanism became loose and fell off, causing the engine to race. Before the engine could be stopped considerable damage was done to the governing mechanism. Proceeded at his own expense to replace the broken parts except a certain pinion which was not damaged enough to hinder the proper operation of the engine. After the accident, in a conversation with B, A learned that B had had trouble with the governing mechanism on previous occasions, but failed to warn A that anything was likely to happen to that particular part. The engine was returned to B in working order, A agreeing to pay the rental price as agreed upon. B insists that A replace the damaged pinion with a new one and pay the cost of having it put on.—Subscriber.

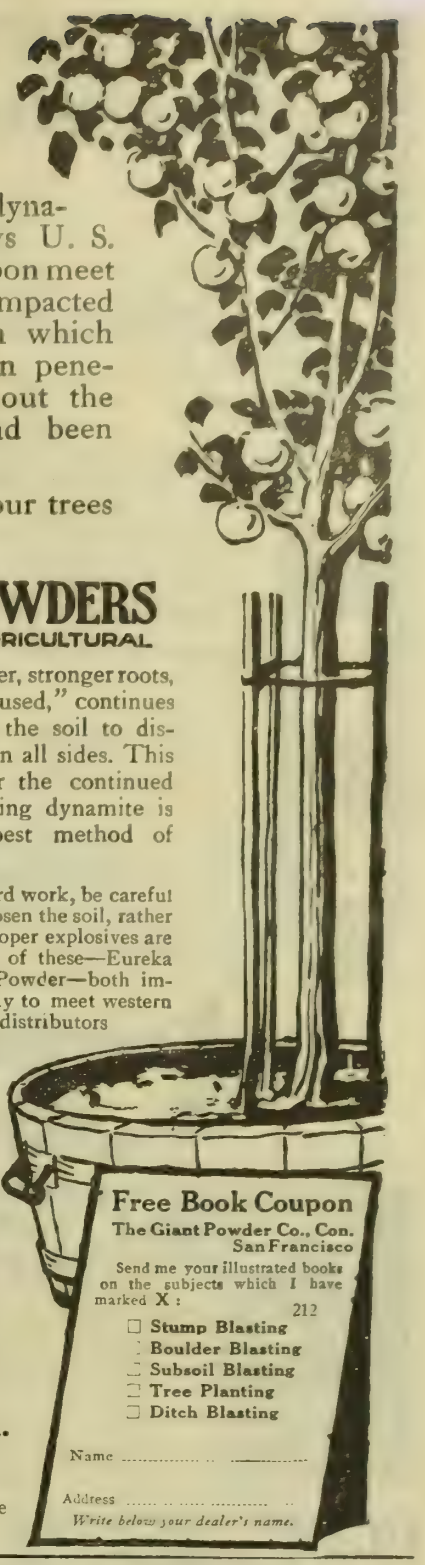
Extraordinary expenses connected with repair of the thing rented are chargeable against the owner, and if it is necessary for the person hiring the article to make such repairs he may compel reimbursement, provided, however, it was not damaged through his fault. The person hiring the article is therefore required to pay only the necessary expenses ordinarily incident to its use. Therefore, if the engine was not in good mechanical condition at the time it was rented to A, not only is A not liable for the replacement of the damaged pinion but it is probable that he could recover the amount paid by him in order to put the engine in proper working condition.

Sale of Bred Cow

Last spring I sold a cow to a neighbor—the words used at the time of the deal were—"I'll take the cow if you'll breed her for me." The price had been agreed on. The cow was bred twice to one bull and twice to two others, to no purpose. The neighbor claims I have failed in my word and that I should pay for returning to examine and put right, but I claim that if I pay him two dollars, the fee I charge for breeding, I am not liable legally for any other damage.—Subscriber.

If the contract is to be considered as one simply for service, you undoubtedly did all that you were required to do. If, however, which is probably the case, the agreement made at time of purchase was one of warranty, then the purchaser would doubtless have a right of action against you for the difference between the value of the cow as she is and that which she would be if capable of producing. In several cases where statements have been made such as the above it has been held that such statement constituted an implied warranty, and for breach thereof the purchaser can recover either the amount paid for the animal upon returning it, or the difference in value.

Would you plant your fruit trees in large tubs?



"Without the use of dynamite in tree-planting," says U. S. Bulletin No. 38, "the roots soon meet with the smooth and compacted sides of the hole, through which they have great difficulty in penetrating. The tree is in about the same situation as if it had been planted in a large tub."

But when you plant your trees in holes blasted with

GIANT FARM POWDERS
STUMPING — AGRICULTURAL

the trees will grow faster, develop deeper, stronger roots, and bear earlier. "When dynamite is used," continues the bulletin, "cracks are formed in the soil to distances of five or sometimes six feet on all sides. This makes the very best conditions for the continued growth of the tree. For tree planting dynamite is recommended confidently as the best method of preparing the soil."

In selecting explosives for your orchard work, be careful to get those that will crack, powder and loosen the soil, rather than pack it or throw it in the air. The proper explosives are the Giant Farm Powders. There are two of these—Eureka Stumping Powder and Giant Stumping Powder—both improved forms of dynamite, made especially to meet western agricultural conditions. They are sold by distributors everywhere. Ask your dealer for them.

The biggest crop-producer a fruit-grower ever used

No. 41 Planet Jr Orchard Cultivator does such thorough work in orchard, vineyard, or hop-yard that bigger and better crops and profits invariably follow its use. Their exceptionally light draft for the work done adds to the ease and rapidity of cultivating. The strong frame carries teeth, sweeps, furrowers, irrigating steels, plows, alfalfa teeth, and special weeders. Has low wheels, steel tongue, tree-shield, side-hitch for low trees, fore-carriage if wanted, also spring-trip standards.

Works deep or shallow and cuts 4 to 6½ feet wide. Made in 5 different styles—various prices.

"Have used No. 41 Planet Jr for fifteen years," writes J. E. Nish, Rialto, Cal. "To my mind it has no equal!"

The Green Feed Calendar

Written for California Cultivator by Jean A. Koethen

(Concluded from Last Week)

MR. J. M. Davison, president of the Arlington Poultry Association, is doing some very careful experimental work on the problem of forage plants in double runs. For each laying house holding 1000 hens he has two yards, each 80 feet by 330 feet. These yards are so arranged, one at the front and the other at the rear, that the hens go into the one by a door at the front and into the other by a door at the end, and there is practically no confusion when the yard is changed. Each of these yards, planted to barley, provides 1000 hens with forage for a month, but Mr. Davison has not as yet found anything but barley that will last so long. Barley is planted (not sown broadcast, but drilled in deep furrows) from October to May, and the hens are turned in on it when it is from two to three inches high. The hens begin near the house and eat clean as they go till the entire yard is cleaned. They are then turned back into the other yard where a fresh crop is growing, and this yard plowed and replanted.

What to grow during the warm summer months is the question Mr. Davison has not solved as yet, but he is trying to solve it with Sudan grass which is very drouth resisting and grows well in hot weather. He will plant his runs with this in May or June and hopes by free use of irrigation to keep them green till October.

For such a system of double runs as Mr. Davison's Professor Rice of the Cornell station recommends "oats and peas sown together very thinly with a liberal seeding of red clover and a very little rape. The oats and peas furnish a rapid growth of green food, some of which will get tramped down, and some will go to seed, but it will serve to protect the clover and rape." The combination of oats and peas and rape would do well for California, but I doubt if the clover would grow as rapidly as such a crop should. Cowpeas could well be alternated with barley during the spring months, or at least mixed with it.

Asked about the green crop as a cheapener of feed, Mr. Davison replied:

"I am very glad to give you any information I can, but I want to say in the beginning that for the poultryman who has a large flock and who wants to feed them in such a way that he will get a good enough egg production from them, I do not know of any cheap feed when all good grains are the price they are now, any more than I know of any cheap flour. It seems to me absolutely necessary that to get the best results we must feed a good quality of wheat or corn or oats or milo or barley or kafir or rye, and at the present time none of them are cheap, and it is a very unprofitable and expensive proposition to cut down on the quality of the feed just because it costs less money. It does not pay. Of course the green feed is one of the great helps, but that applies as well when grains are low as when they are high, and on a large scale I never figured so much on the green feed as a cheapener of the feed but rather as a stimulator of higher production. I know, of course, that any reasonable way of raising green feed makes it a cheaper feed than grain, and that fact, coupled with the fact that it adds much to the health of the flock, makes it one of the most important considerations in operating a chicken ranch."

Mr. Davison keeps 3000 hens and is making them pay, so I think we may accept his slogan, "Not cheaper feed, but more eggs", as adapted to all California. If we are getting 20 eggs where we got 18 before, we may snap our fingers at the high prices of feed. Green feed does stimulate egg production. It keeps the hens healthy and cuts out expensive epidemics and more expensive loss by death. Grown in the runs it keeps the soil sweet and the hens busy. If it is not the "secret" of getting eggs, it is the sine qua non of successful poultry husbandry.

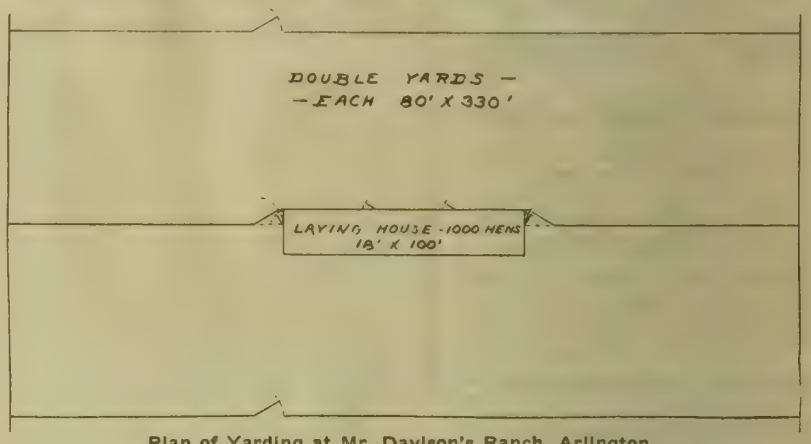
Calendar

A planting schedule for the different greens that may be planted through the year might be arranged as below, though any farmer will see ways of changing it:

September to January. — Barley, rape, mustard, cowpeas planted in runs; lettuce and turnips in gardens; kale and chard in boxes.

January to May.—Oats, barley, rye, mustard, rape and all suitable green crops in runs; kale transplanted into garden or runs; chard into garden. Last planting of lettuce for chicks in April.

May to September.—Sudan grass rape, possibly mustard in runs; continue transplanting kale and chard; make the most of alfalfa and sprouted oats. Oats and barley sprout well if soaked and buried in the ground and kept moist.



Plan of Yarding at Mr. Davison's Ranch, Arlington

In the dust bath—which must always be provided—should be mixed reliable louse powder, to keep hens free from vermin.

The proper way to feed oyster shell is to have a small box of it within reach, so the fowls may help themselves at will.

Wonderful Egg Producer

Any poultry raiser can easily double his profits by doubling the egg production of his hens. A scientific tonic has been discovered that revitalizes the flock and make hens work all the time. The tonic is called "More Eggs." Give your hens a few cents' worth of "More Eggs" and you will be amazed and delighted with results. A dollar's worth of "More Eggs" will double this year's production of eggs, so if you wish to try this great profit maker, write E. J. Reefer, poultry expert, 4261 Reefer Bldg., Kansas City, Mo., who will send you a season's supply of "More Eggs" Tonic for $1.00 (prepaid). So confident is Mr. Reefer of the results that a million dollar bank guarantees if you are not absolutely satisfied your dollar will be returned on request and the "More Eggs" costs you nothing. Send a dollar today or ask Mr. Reefer for his Free poultry book that tells the experience of a man who has made a fortune out of poultry.—Adv.

Letters to a Beginner

Written for California Cultivator By Jean A. Koethen

DEAR GEORGE:—If you are not satisfied with three months' hatching (and I suspect you will be heartily glad to stop with less) try getting out a few hundred chicks in September and October. September is a splendid month. The weather is so warm that you can use fireless brooders, and that is a considerable saving. You can put these fireless brooders right out in the pullet and cockerel coops in the orchard, and by the time they are old enough to range, unless the season is unusually dry, there will be green feed everywhere for them. I like to hatch in the fall, but it has its disadvantages. Fall pullets lay at an earlier age than spring pullets, but they lay smaller eggs, and these eggs, coming at the season of low prices, are not worth much till summer. Then your fall pullet is at her best, for when the spring pullets are beginning to drop their feathers she lays right on.

Renewing the flock by means of the yearly hatch is the most expensive part of poultry husbandry. There is so much loss all the way along, such a tremendous shrinkage between the breeding pen and the finished product, the laying pullet! Most poultrymen feel that they must raise each year half the number of hens they keep—that is, if you aim to keep 1000 layers, you must raise 500 pullets each year. This gives you a practically new flock every two years. When we learn, as we doubtless shall, to increase the longevity of our layers so that they shall be good for four years instead of two, the expense of hatching will be cut in two. Experiment station investigators are turning their thoughts to this very thing, and the latest bulletin of the Connecticut station put longevity, "the ability to live and produce a profitable number of eggs for three years or over," next to vigor and fecundity as a test for the selection of breeders. We all know that many hens do lay to a good old age. Careful selection will make these hens the mothers of the flock.

Some breeders think we shall go even farther than this and learn to pick out for our mothers the hens whose eggs produce pullets rather than cockerels. That there are such hens has been proven. Now, if we can just be patient and painstaking enough to find them, and make our hatch three-fourths or seven-eighths pullets, another problem will be solved. I don't doubt we shall do this very thing, if we really wish to do it, for Providence is very kind to folks that are in dead earnest.

Don't forget to order your day-old chicks in good time, and from a breeder who can show you the record their mothers have made, and be sure you get your own incubators in working order and running several days before you want to put in the eggs. Mary will see that your hatching eggs are keep in a cool place and turned every day. That is just the sort of puttering job women like.

Affectionately,

Aunt Jenny

EGG LAYING CONTEST

The American School of Poultry Husbandry of Leavenworth, Kansas, of which T. E. Quisenberry is president, is conducting an egg laying contest, The First American Egg Laying Contest. Thirty states are represented in contesting pens and 22 varieties of poultry. A Kansas White Leghorn pen won the cup for best November record, laying 87 eggs.

Summer Time on Richland Egg Ranch, Kings County

WORTH WHILE SUGGESTIONS

Don't think that there is too much science in the modern method of breeding, feeding and rearing chicks and chickens. Too much science misapplied is worse than no science, or anything haphazard. Intelligently directed effort always brings results.

Ever turn over the soil in the henyard? Try it and watch the improvement this winter and next year in the better conditions surrounding the flock. The results will pleasantly surprise you. Lime always goes on the soil first, before turning it over.

Build a few trapnests out of old boxes and get a line on a few good layers this fall and winter.

Sour milk will prevent a whole lot of trouble if fed to the youngsters.

Lawn clippings, where it is possible to get them, will furnish a fine feed.

Aristocracy from the Panama-California Exposition

These hens, property of C. H. Hosford, made the highest score at the Panama-California Exposition during 1915.

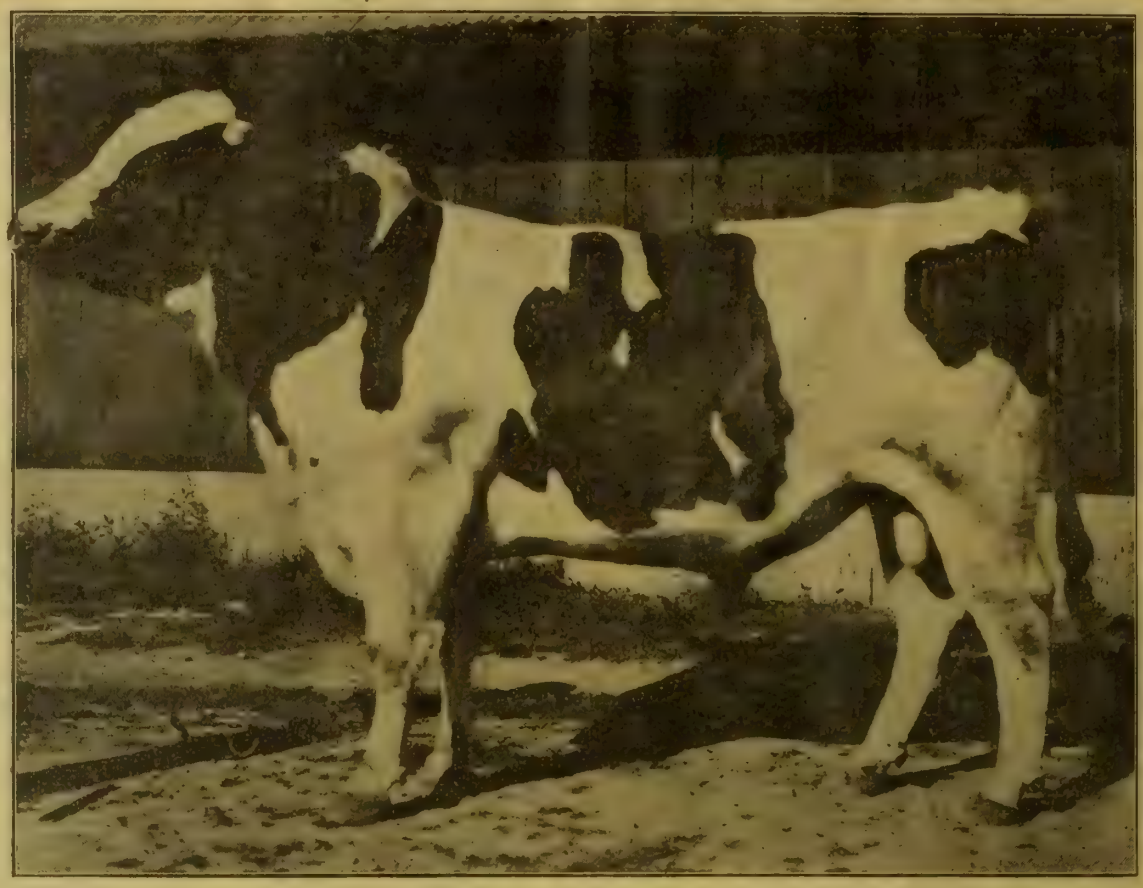
KING SEGIS PONTIAC JANNEK

A Sire With a Royal Pedigree



H. B. No. 161758

Born September 20, 1914

His sire is the great sire and show bull King Segis Pontiac whose dam, Pontiac Clothilde De Kol 2d not only made world's records for seven, thirty and 365 days but was the first cow in the world to make over 30 pounds of butter in seven days at three successive freshenings.

The dam is a show cow as well as a great producer. Calving early in January she won second prize in the aged cow class the following September at the New York State Fair, defeating a long string of cows fresh and ready to freshen. She milked 100 pounds of milk in a day in official work.

One brother to this bull is sire of a 40-pound cow, another is the only sire to have two 28-pound junior two-year-olds.

My herd of registered Holstein-Friesians has been assembled during the last six months and as rapidly as the females freshen they will be put on official test. Many of the cows already have A. R. O. records.

In addition to the great young sire whose pedigree appears on this page I have an interest in King Paul Korndyke Vale, a son of King Korndyke Sadie Vale, a bull calf purchased at the Rhoades dispersal last September. When old enough for service this youngster should get some sensational heifers as his two nearest dams average 36.24 pounds butter in seven days. I will use King Paul on some of my females.

Bull calves out of officially tested cows offered for sale from time to time. Prices submitted on request.

Tractor Attachment for Ford Cars

We secured our factory November 1 last. We made our first deliveries in December and now, in January, in less than sixty days after we commenced the manufacture of our Tractor Attachment for Ford cars, we are obliged to treble the capacity of the plant. That tells its own story. Every Tractor Attachment that goes out brings new orders. There has not been a single criticism or objection. Every buyer so far is a pleased customer, and the tractor is doing more than we claimed for it. It is built on honor, is pronounced by mechanical experts to be a splendid piece of mechanism, and seems destined, through its very low cost, wonderful power, and complete adaptability to every class of farm work, to mark a new period in the development of the farm.

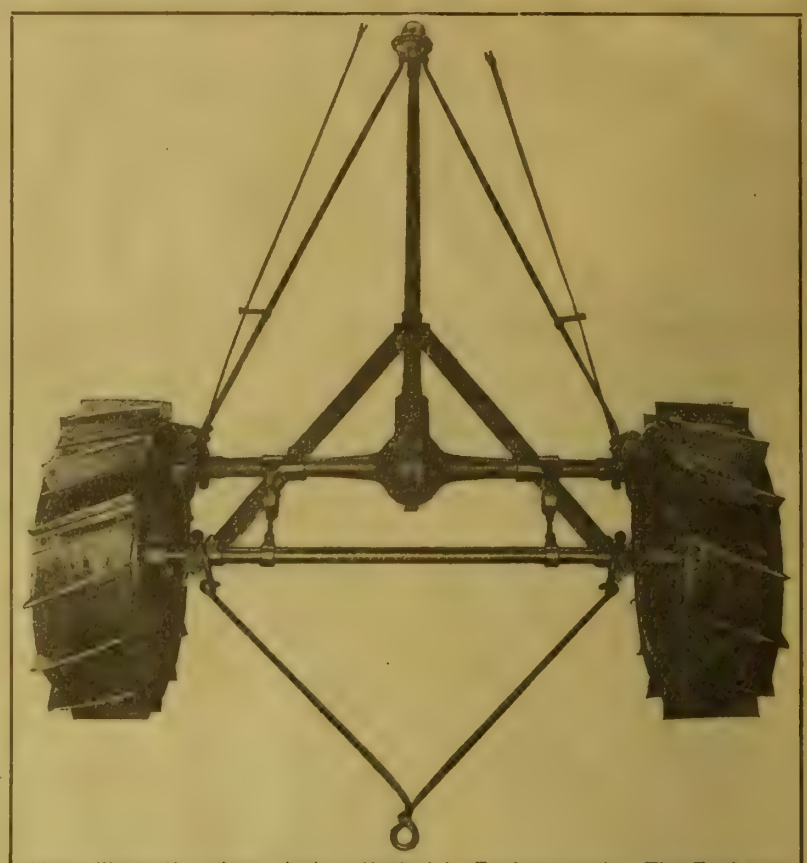
Tractor wheels are 30 inches high with 10-inch face and grousers set diagonally.

We have been granted basic patents by the U. S. Patent Bureau. Imitators will doubtless spring up, but if you purchase one of the imitations you will be buying an injunction as well as a tractor.

The secret of the power is in the gear reduction. By a 30 to 1 reduction on the tractor the speed of the car is transformed into power. In other words the gasoline that will propel your car twenty miles an hour on the road, will give through our attachment a speed of from two and a quarter to three miles an hour. In low gear the power is almost unlimited; in fact, so much power is developed that all general farm work is done in high gear.

When it is desirable to use the Tractor in hauling heavily loaded wagons to market, the grousers can be detached or bands (which we supply) can be readily slipped over the rear wheels and locked, giving a wide, smooth tread, permitting the Tractor's use on any improved roadway.

It will haul an ordinary four-horse load on the highway at a speed of five miles per hour.



Above illustration shows device attached to Ford rear axle. The Ford rear axle with propeller shaft housing and universal joint is easily recognized. Camps are clearly shown, also dead axle for traction wheels.

Farm Tractor to Touring Car in 20 minutes

In addition to its low cost, one very great advantage is the speed with which the Tractor can be attached and detached and the Ford transformed from a touring car into a valuable farm tractor, or the tractor back into a touring car.

The Tractor wheels are mounted on a dead axle, which is attached to the rear axle of the car, and by means of split brackets to the drive shaft housing. This gives a three-point suspension as a means of support to the car.

To attach the tractor, remove the rear wheels of the Ford and replace with spur gears which drive the tractor wheels. Both sides of the tractor wheels are equipped with dust proof collars.

The adjustment takes about 20 minutes, the average time of harnessing a team. In fact, the change has been made at our factory in seven minutes.

For sharp turns, such as in orchards, etc., it is only necessary to remove one of the brake bands; the other wheel acts as a pivot.

The Saving

According to Federal statistics a horse averages 100 working days a year. But the horse has to be fed and cared for 365 days in a year. Our Tractor Attachment demands neither expense nor care when not in use, and in twenty minutes' time the Tractor can be changed back into a pleasure car. Just do a little figuring on your investment in two or three horses and their care. Why not sell the horses while there is a good market for them? Your tractor will pay for itself in a few months in the saving on feed.

Reserve Power—We have frequently done the work of six horses, and so much power is developed through gear reduction that there was not any evidence of heated bearings or strain on the car. But we do not recommend such heavy work as a steady practice. You can depend upon the Tractor doing the work of from two to four horses day after day, with plenty of reserve power for emergencies.

Guarantee—The Tractor Attachment is sold under a 60-day guarantee to replace any parts defective in workmanship or material, and under an absolute guarantee to do everything we claim for it. It will work in sand or mud in which a heavy tractor would be helpless.

Agencies—We give the choice of two agency propositions:

1. Exclusive county control for 90 days upon the purchase of a Tractor Attachment at the list price and the payment of fifteen $10 deposits for the sale of fifteen Tractor Attachments within three months after the receipt of the attachment. If selling ability is shown the agency will be continued indefinitely.

2. A commission on sales in open territory upon the purchase of a Tractor Attachment at the list price, and without cash deposits. The commission will not be as large as under proposition No. 1 and territory is subject to sale.

Write for our terms to agents. Liberal commissions.

Hauling a spike-toothed harrow.

Price

The price of Tractor Attachment is $150 f.o.b. Los Angeles. We have secured special freight rates. If you wish an early delivery send check for $10.00, balance to be paid by draft attached to bill of lading.

If you wish further and detailed information, address the

MORE THAN SATISFIED

Woodland, Cal., Dec. 28, 1916.
Los Angeles Auto Tractor Co.,
Los Angeles, Cal.

Dear Sir—I received the attachment all in good shape. Got one and a half day's work before rains. Am more than satisfied with same.

What is the cost of the ring gear on tractor wheel? Yours truly,
R. E. FISHER.
58 Second Street.

WIRES DUPLICATE ORDER

Oakland, Cal., Jan. 12, 1917.
Harlan W. Brush, 428 American Bank Bldg., Los Angeles, Cal.

Ship tractor attachment and bands to Stockton. Draw on Stockton Savings and Loan Society Bank, Stockton. Letter following. **Tractor all right.**
ED. WALKER.

LESS THAN SIX CENTS AN HOUR

Pomona, Cal., Jan. 17, 1917.
Mr. Harlan W. Brush, Pres.,
Los Angeles Auto Tractor Co.

Dear Sir—Our tractor attachment for Ford Car is giving good satisfaction. Using same for orchard work on seventy acres and expect to be able to do the work on this acreage. Burning 10½c distillate and find we use about one-half gallon per hour. The usual 10-hour job—cultivating 10 acres one way—we do in not more than six hours, with positively no perceptible damage to car. Our car is an old one picked up cheap but overhauled and engine put in good shape. Have not as yet given it hard test pulling on road, but feel that it will do the work in a satisfactory manner. The thing that appeals to me is that when not in use it does not eat. Have auxiliary water tank on car and find cooling system keeps engine cool under all conditions.

Yours very truly,
T. B. EREDENDALL.

LINDSAY SURPRISED

(From Fresno Morning Republican)

Lindsay, Jan. 15.—An orchardist living on the west side created no little amount of interest on the streets here today when he passed through hauling his fruit to the packing houses by means of automobile power. To his car he had attached tractor wheels, which was hauling a wagon containing 123 boxes, or six and a quarter tons of fruit. The attachment, which was made in Los Angeles, can be adjusted in thirty minutes, and with it the car performs the work of four horses. The orchardist stated that he brought his fruit seven miles over muddy roads without difficulty. Returning home he removed the tractor wheels and came back to town in his automobile as usual.

Swine Breeders in Convention

State Convention Meets in Los Angeles and Holds Most Important Session of its History. Packing House Managers Participate and Agree to Establish Grades and Prices According to Quality

By F. F. Stonerod

WITH the largest and most enthusiastic gathering of swine breeders in the history of the organization, the annual meeting was held in Blanchard Hall, Los Angeles, January 18 and 19. This was the first time the breeders ever convened in Southern California, but it is safe to say it will not be the last time if the many remarks heard at the convention are a criterion.

This was a convention worth while indeed. Attendance exceeded all expectations, enthusiasm ran high, cooperation between packer and producer was of the closest, and it was the unanimous opinion of all that this convention accomplished more real good in the two-day session than all previous conventions combined.

Problems of most vital interest to the producer were discussed, but the climax of the meeting came when J. L. Thatcher arose in session and asked President Cunningham if a committee of three producers and three packers could not be appointed to discuss ways and means whereby the marketing problem in California today might be solved. "If the packer will give the shipper who sends a prime hog to market a price based on a per cent dress basis we are willing and ready to have the packer cut the price of the unfinished hogs. In other words, if the packer will pay at the rate of ten cents per hundredweight for every one per cent an animal will dress out over 77 per cent, we want him to deduct the same ratio for every one per cent the animal dresses out under 77 per cent. The entire trend of the convention previous to Mr. Thatcher's motion was toward the market problem.

Of course this matter will not be entirely settled until the two committees reach an agreement as to the dress per cent basis that will be adhered to by the packers. The question of how the shipper will know the exact dressed weight of his animals after they are slaughtered, and several other minor questions, will have to be solved before they will be published. But these are only incidentals that will be easily and quickly adjusted.

The convention opened at 10 o'clock Thursday morning. Mayor Woodman of Los Angeles was down on the program to deliver the address of welcome but being unable to be present his secretary welcomed the breeders to the city.

Mr. McWilliams was followed by President Cunningham, who called the meeting to order after a few short and pointed remarks about the association and the importance of the swine growing industry to the state. Secretary Thompson then read the minutes of the last meeting and afterward announced the next meeting for May 28 to June 1 at Davis during farmers' week when several other livestock conventions will be in session.

L. L. Lamson of the firm of Peters, Lamson and Walker then read his interesting paper on "Feeding and Growing Market Hogs." Mr. Lamson was loudly applauded when he said, "The herd boar is one-half the herd the first generation, three-fourths the herd the second generation, seven-eighths the third generation, etc. ad infinitum." He mentioned that three lots of market hogs had been fed different rations with varied results on the company's farm. One lot cost $10 per hundredweight gain, lot two cost $6.88 and lot three cost $6.76. The hogs fed ground milo, sour milk, tankage and pasture made the largest and cheapest gains.

William Bernstein, the noted breeder from Hanford, talked on "The Breeding Herd and the Purebred Business." Mr. Bernstein is widely known as a breeder and exhibitor. In his remarks he said that when a breeder sells inferior boars to go into a grade herd, he made a big mistake and if breeders did not use more care in this respect the harm done would be irreparable.

Secretary Thompson next read a paper written by Joe Biddle of Hanford, who could not be present. Mr. Biddle laid stress on the fact that farmers did not trim or spay their hogs enough with the result that too many piggy sows and boars were sent to market which helped to keep the average price low.

Someone in the audience brought up the question of crossing two different breeds for market purposes. He said that he had gotten fine results from crossing. He was answered by another gentleman who advised that the first cross only of purebreds got good results, that if caried any farther crossing was a dangerous practice. Uncle Jim McCord of Hanford then arose and said: "I find that by crossing Chester Whites on Duroc-Jerseys, Duroc-Jerseys on Berkshires, Bershires on Hampshires, Hampshires on Poland-Chinas, etc., that I get a great variety." His remarks were the cause of much good-natured banter.

One of the feeding questions discussed was the feeding of alfalfa either cut or ground. Professor Thompson said that the feeding of too much alfalfa was a common mistake. "The son, "has a tendency to grow round instead of evenly, potbellied in other overfed alfalfa hog," said Mr. Thompwords.

University experiments showed that a ration of alfalfa meal with grain made better and cheaper gains than chopped or cut hay or whole hay and grain. Brood sows require a different ratio of this ration than market hogs.

D. O. Lively of San Francisco then moved that the convention adopt the feeding methods and rations as practiced at Davis during the recent experiment where such cheap and rapid gains were made on ground milo, tankage, alfalfa, etc. Mr. Lively said there should be some method of getting such valuable data in the hands of the farmer as soon as experiments were completed. His motion was adopted.

A Tehachapi grower asked the breeders the remedy for a sow eating her pigs and was answered by A. J. Lovejoy in one sentence. "Feed less grain and more protein." Mr. Thompson then introduced Mr. Lovejoy to the assembly. To many he needed no introduction for "Andy," as he is af-

Continued on Page 104

Is Fumigation to be Simplified?

Hydrocyanic Acid in Liquid Form Which Will Permit of Dispensing with Acid and Cyanide May be a Possibility. More Uniform Results with Less Injury to Tents

IN recent months some interest has been awakened among California scientists, growers and fumigators as to the possibility of using liquid HCN for fumigation, believing that thereby the process of fumigation might be still more simplified than has been the case through the cyanofumer, which was a great step forward in the art of fumigation. We have taken up this matter with the leading manufacturers and dealers of sodium cyanide and are informed that it is a well known fact that HCN liquifies at a temperature below 26.5 degrees Centigrade, and that furthermore, the use of liquid HCN for fumigation of citrus trees and other plants as well as buildings, stored products, etc., has been suggested some time ago before the matter came up in California. We are enabled to reprint below an article by, the South African entomologist, Chas. William Mally, in the South African Journal of Science of October, 1915, entitled "Anhydrous Liquid Hydrocyanic Acid for Fumigation Purposes," which shows that this question was studied in South Africa over a year ago.

While it may seem that the use of HCN in liquid form has certain advantages over the present fumigation methods, it must be remembered that before its practical value for growers and fumigators can be established, a thorough investigation must be undertaken by those who are familiar with the subject, and we believe that such an investigation has been started by the proper authorities and that in due time the results of the necessary experiments will be given to the public.

"For the destruction of insect pests on fruit trees by means of hydrocyanic acid gas the usual practice is to generate the gas by the action of dilute sulphuric acid on potassium or sodium cyanide, either dry or in solution. Either method leaves much to be desired, for it not only takes time and care in preparing the chemicals, but there is also the danger of burning the tents by acid coming in direct contact with them through handling them; or the absorption of fumes or vapors driven off during the generation of the gas may result in the familiar "rotting" of the canvas. The above factors are of special importance in connection with vineyard fumigation for the destruction of the mealy bug, Pseudococcus Capensis Brain, because the vines, whether trellised or "bush" must be covered with long, narrow sheets of gas-proof canvas, almost the whole of which is in close proximity to the freshly-generated gas by whatever means it is produced. The space enclosed is very small, and hence only a small amount of gas is required. On account of the shape of the tent, the gas should be liberated at several points to secure a quick and uniform distribution. This means a number of small generators or points of introduction from an external generator. In military work the trouble with acid and cyanide and generators increases the amount of strict supervision necessary and the time required to do this work. On going into the matter of possible ways of improving on present methods, I decided to try to make use of the fact that the gas readily condenses on being subjected to a low temperature, and produces the anhydrous liquid hydrocyanic acid. The matter was discussed with the government analyst, Dr. C. F. Juritz, and later on, with the assistance of Mr. W. W. Brighton-Manning, in arranging the details of a small experimental apparatus, a small quantity of the liquid acid was produced at the entomological experiment station, Rosebank, Cape Province.

"The liquid acid proved to be much easier to work with than was antici-

160 ACRE FARMS IN WESTERN CANADA FREE

Canadian Farmers Profit From Wheat

The war's devastation of European crops has caused an unusual demand for grain from the American Continent. The people of the world must be fed and wheat near $2 a bushel offers great profits to the farmer. Canada's invitation is therefore especially attractive. She wants settlers to make money and happy, prosperous homes for themselves by helping her raise immense wheat crops.

You can get a Homestead of 160 acres FREE and other lands at remarkably low prices. During many years Canadian wheat fields have averaged 20 bushels to the acre—many yields as high as 45 bushels to acre. Wonderful crops also of **Oats, Barley and Flax.**

Mixed farming as profitable an industry as grain raising. The excellent grasses full of nutrition are the only food required for beef or dairy purposes. Good schools, churches, markets convenient, climate excellent.

Military service is not compulsory in Canada, but there is an extra demand for farm labor to replace the many young men who have volunteered for the war. The Government is urging farmers to put extra acreage into grain. Write for literature and particulars as to reduced railway rates to Supt. of Immigration, Ottawa, Canada, or

Gilbert Roche Canadian Government Exhibit,
San Diego, Cal. Canadian Gov't Agt.

pated. On testing it with different insects, I came to the conclusion that the gas arising from the liquid diffuses more quickly and is more violent in its action than that from an ordinary generator. This is probably due to the absence of moisture or other impurities which may, in the case of generator gas, have a retarding effect. If this holds in practical work it is an important item for it involves a smaller amount of gas or else a shorter exposure.

"Portions of ordinary silk ribbon, muslin, and boat-sail drilling saturated with acid showed no ill effects after a fortnight. This also is of considerable practical importance for it indicates that the "rotting" of fumigation tents under present methods is due to impurities from the ordinary generator. Whether there is a corresponding reduction in the injury to plants has not been determined.

"The dangerous nature of the acid must not be overlooked, although on the whole, with equal care in giving instructions as to its use, I consider that it is no more dangerous than bisulphide of carbon.

"Under normal conditions, it may be possible for manufacturing chemists to produce the anhydrous liquid acid economically, possibly from low-grade materials that are not suitable for fumigation under present methods, and ship it as a commercial article in place of the cyanide and acid. In such case it will simplify practical work because the acid which vaporizes very quickly on exposure to the air, can be injected through suitable openings in the tent or other enclosed space and thus do away with disagreeable and cumbersome generators and the accompanying by-products. The practical results should be more reliable than by present methods.

"A larger apparatus is being arranged with a view to producing a sufficient quantity for field tests."

Requirements and Methods of Growing Oranges

Written for California Cultivator By E. L. Koethen

IN your October 21 issue you reprint an article compiled by Prof. R. L. Adams, titled as above, in which some statements are made which I do not think ought to go unchallenged.

"Olimatic requirements. Freedom from Frost." Does the author know of any of the best producing orchards that are really free from danger of frost? It is an accepted fact that our California oranges owe their peculiar sprightliness to the fact that they are exposed to low temperatures at times, yet not low enough to injure the cells. This makes for the difference between our fruit and that grown in tropical countries where the citrus fruit is dead sweet and lacking in aroma and acidity.

"Soil Requirements. Subsoil open, no hardpan." "Six feet deep." We would not contend that hardpan was a desirable condition for citrus culture. But we do say that it is not an insurmountable difficulty. In fact one of the best lemon groves in California is located on soil six to eight inches to hardpan all over the grove, and yet it bears with proper care from ten to 18 loose boxes of fruit per tree per year. The "hog wallow" land up in some of the interior countries in the northern citrus belt all has to be shot before planting, and yet trees 15 years old are still bearing bountiful crops. Such soil does require especial care though, and it is desirable to avoid the hardpan if possible. It must be borne in mind that the majority of the feeding roots of citrus trees are located within 18 inches of the surface, and that the character of the subsoil in regard to porosity is more important than the more retentive hardpan. When asked why he did not blast the lemon grove mentioned above the owner replied he was afraid to do it as below the hardpan is quicksand, and he does not wish to "drop the bottom out of his grove."

Under the head of pruning. "Pruned in fall to open tree and sometimes in spring to remove suckers (June)." This might be good advice in the frostless region mentioned by the author, but in Southern California at least it would be very bad practice. Oranges need all the foliage on the trees during the fall and winter. It is then that we have the high winds and exposure to dangerous frosts. To remove in the fall is like removing the clothes from a man who has kept himself clothed during the warm summer months, just when exposure is greatest. All real pruning is best done during the months just preceding the blooming season. As to the suckers they may be removed at any season. The sooner after they have started to grow the better, if they are so located as to need removal. The point is for the operator to determine what should be treated as sucker and what is needed to form part of the framework of the tree.

Finally in treating fertilizing. "Manure and chemical fertilizers used, the practice varying. Cover crop of rye, vetch, bitter clover or alfalfa planted in August or September, irrigated every two weeks, and plowed under in February or March." We are fortunately learning to avoid chemicals in fertilizing. Organic matter is taking the place of all forms of chemicals. This is being emphasized by the experiments made at the Riverside experiment station. Growers are fast learning that this is the right practice. As to using alfalfa as a cover crop planted in August or September for spring plowing, it is not possible. The growth made by newly sown alfalfa at this season is too small to count. Some experiments have been made to allow the alfalfa to grow in the orchard a year or more, but so far it has not given results that lead to any general adoption of the method.

* * *

We think perhaps there is one state-

R. M. TEAGUE, Manager

San Dimas, California

ment made by Mr. Koethen which also should not pass unchallenged. He says: "We are fortunately learning to avoid chemicals in fertilizing. Organic material is taking the place of all forms of chemicals."

Perhaps Mr. Koethen does not mean to be as exclusive in his treatment of chemicals as his language sounds. We believe that some of the best fertilizing which can be done on some soils in some localities is secured by the use of chemicals to aid in growing green manures to fertilize the land. There are conditions where soils are exceedingly poor and where organic fertilizers are impossible to secure where highly concentrated chemical fertilizers afford a foundation. Plainly we must have organic matter added to the soil, but if chemicals will aid in the securing of organic fertilizers, let us encourage their greater use.—Edit.

Gum Disease on Lemon Trees

Written for California Cultivator By C. S. Wilkins

Lemon trees are more susceptible to gum disease than are orange trees. Florida sour stock is almost immune. Lemon and orange trees when budded on Florida sour stock show gum disease more when the bud is planted below the surface than when planted two or more inches above the ground.

Select trees for new orchards which have the buds eight or more inches above the roots and plant so that when the tree settles the bud will still be above the ground. It is important to have the buds high enough, making allowance for filling in of soil which will be carried from hillsides by storm or irrigation water. Trees to be planted on such ground should be budded on two or three-year-old sour stock, making it possible to have the buds high enough for this filling in of the soil around the trees.

As I go from orchard to orchard I notice that about 20 per cent of the lemon trees are affected with gum disease when the buds are two or more inches above the ground and about 80 per cent of the trees are affected when the buds are below the surface.

Planting Trees

FROM a bulletin issued by F. K. Howard, horticultural commissioner of Kings County, we quote the following directions for successful planting:

Planting Suggestions

"The roots of every tree should be examined before planting. All large root ends should have a fresh clean cut with a sharp knife or shears. Make a slanting cut with the cut surface on the underside of the root. Where a root is mangled or bruised, it should in most cases be cut back to a sound place. The wound made by the cutting away of the seedling stock should be on the north or northeast, in order that this weak point may be shaded as much as possible from the afternoon sun.

"If the roots of young trees grow more to one side than the other place the strongest roots toward the prevailing wind. The use of water to settle the earth around the roots is sometimes desirable in sections where rainfall is light or uncertain Pour in four or five gallons from the water wagon after the hand work in spreading roots and pressing the soil around them has been done and the hole partly filled. When the water has soaked away fill the hole with fine earth without tramping. In irrigated districts leading the water along the line of trees in a furrow to settle the ground at planting is a good practice.

Use of Manure

"Never put manure in the hole with the tree. Sometimes the injunction is, "Never put anything but well rotted manure in the hole." It is better to put in none of any kind. Manure should be spread upon the ground after planting. The rains then leach it out and it may be turned under in the spring plowing.

Depth of Planting

"The depth to which trees should be set has always been a matter of discord among planters. The safest rule under ordinary circumstances is to get the tree as nearly as possible the same depth as it stood in the nursery row. That is so as to have it stand that way after the ground has settled, or the surface returned by cultivation to its normal level. In planting in loose soil in the drier parts of the state, it is often desirable to plant rather low, because several inches depth of surface soil become dry and the roots should be well in the moist layer.

Guarding Against Sunburn

"Newly set trees should be protected against sunburn. This can easily be done by winding strips of burlap from old grain sacks spirally around the stems, beginning just below the ground surface to the points where the young shoots will appear. When these start these can be loosened and rewound so as to protect the bark between the shoots. The top can be fastened with a stitch or two with a twine needle. Manufactured tree protectors of paper or rushes which are readily adjusted around the tree, are now largely sold. Whitewash is a good protection from sunburn. For young trees however it should be made with airslaked lime which has lost some of its causticity. Another whitewash which has been largely used for young trees, consists of four ounces of whale oil soap dissolved in each gallon of water, Spanish whiting being stirred in to give the solution a paint like consistency. Millions of trees have perished in this state and as many more been condemned to sickly lives, because of sunburn and borers which seek the injured bark for entrance."

Work has begun on the big packing house of the Placentia Orange Association at Fullerton.

Pear Scab

Pear Scab

It will soon be time to spray for prevention of scabby pears. We quote from "Practical Suggestions" by Ralph E. Smith, which has been issued by the agricultural experiment station in Circular No. 157. Prof. Smith says:

"Plow under dead leaves as thoroughly as possible.

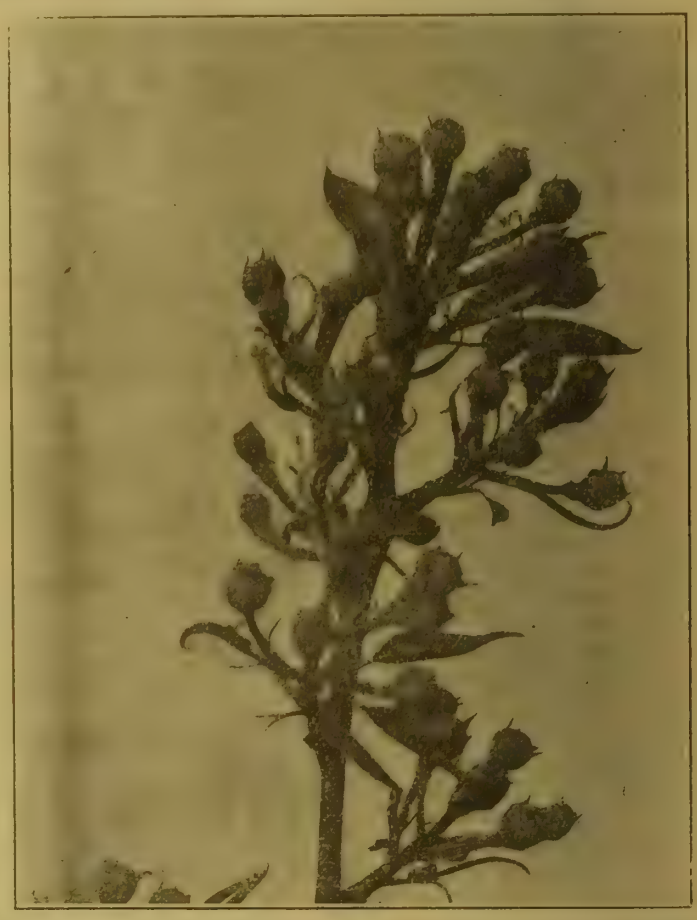

Fig 4. Blossom Buds Well Out. Second Spraying Should Be Finished

Fig. 3. Blossom Buds Appearing

"Spray with Bordeaux mixture twice while the buds are unfolding, first when the leaf buds are just opening, second, a week or ten days later, just before the individual blossoms open.

"The first spraying is the more important, but both should be given.

"In large orchards begin spraying when the buds are only slightly open, so that if delays occur the trees will get at least one good spraying before it is too late. Spraying before the first stage or after the last will do little or no good in scab control, especially with Bartletts.

"As an extra precaution make a third scab spraying by mixing the first lead arsenate codling moth spray with Bordeaux mixture instead of plain water.

"Spray with good equipment and high pressure and cover the trees thoroughly, especially the twigs and buds.

Directions for Making Bordeaux Mixture

"Bluestone, 20 pounds; quicklime, 25 pounds; water, 200 gallons. Dissolve the bluestone and slake the lime in separate vessels. Strain the bluestone into the spray tank and fill it half full or more with water. Strain in the lime mixed with the rest of the water. Always have the materials well diluted before mixing them together.

"If a third spraying of lead arsenate combined with Bordeaux mixture be made the amounts of bluestone and lime may be reduced to 15 and 20 pounds respectively."

NURSERYMEN'S CLEARANCE HOUSE

ONE of the perplexities of the nurseryman at the close of the planting season is the disposal of surplus stock—usually the disposal is by way of the brush fire—also the lack of sorts in filling his orders. At the last California Nurserymen's Convention President Armstrong touched upon this point as follows:

"It goes without saying that more or less stock reaches the brush pile because the trade is often not aware of its existence. It has often occurred to me that the association might issue a list of all available stock, together with name and address where to be secured. In this way all of us would know of available supplies when in need of some particular line. As it is, I may send to the fire a lot of good stuff that Richard Roe may be sadly in need of.

"In a cursory review these are but a few of the salient features that should command the careful deliberation of the convention. Many others will suggest themselves to all of us with more or less force. But the main thing is to better commercial conditions by a broader fellowship and a cooperative spirit that will do away with sectional feeling and jealousy; for if one prospers the other fellow is also doing better. Standardize values as much as possible; deal liberally with each other; establish stable credits; become leaders and not followers in horticultural development; lend the helping hand to the intending planter as well as to your competitor; briefly, render the service that serves, and my word for it, the nurseryman's outlook will be brighter instead of darker, and optimistic opinion for the future will put pessimism on the run."

Owing to serious illness of Mr. C. A. Tonneson, secretary of the Pacific Coast Association of Nurserymen, the report of the 14th annual meeting held in June has not been brought from the press until recently. This meeting was held at Medford and the many interesting addresses made at the convention are included within the report. It is sent to all members of the association.

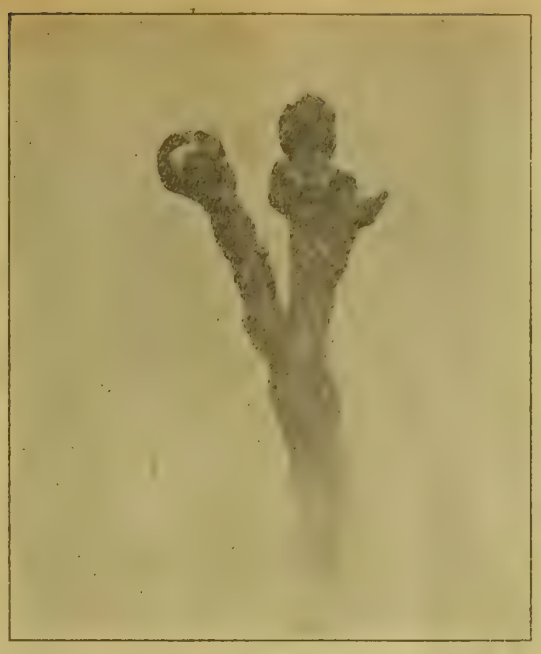

Fig. 1. Too Early to Spray. Buds Just Opening

Fig. 2. Further Development of Buds

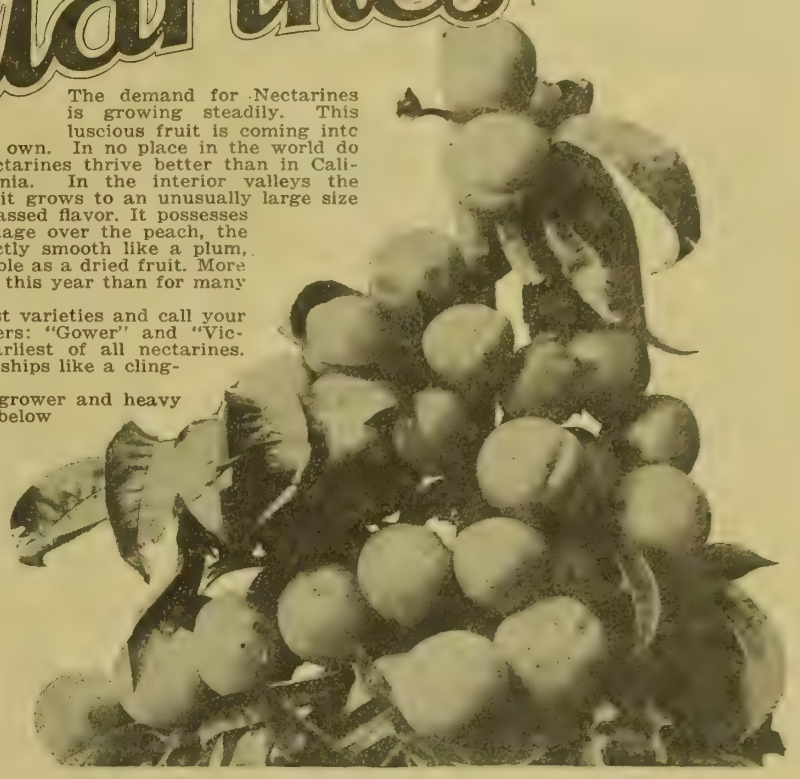
Plant Nectarines

The demand for Nectarines is growing steadily. This luscious fruit is coming into its own. In no place in the world do nectarines thrive better than in California. In the interior valleys the fruit grows to an unusually large size and is of unsurpassed flavor. It possesses a marked advantage over the peach, the skin being perfectly smooth like a plum, thus making it particularly valuable as a dried fruit. More nectarine trees are being planted this year than for many seasons.

We have a large stock of the best varieties and call your particular attention to two leaders: "Gower" and "Victoria". The "Gower" is the earliest of all nectarines. The fruit is very firm, freestone, ships like a clingstone peach, delicious flavor.

The "Victoria" is also a strong grower and heavy bearer, ripens in August. Read below what Frank Vietor says of it:

"I have on my ranch near Fowler 300 "Victoria" Nectarine Trees, which are now 12 years old. These trees have borne good crops and the fruit has sold easily for several years. This year my crop from these trees sold for $2250.00. Part of the fruit was dried and part was sold green, all of which was shipped to the East and sold quickly.



THE GOWER—the new early money making Nectarine

We also call attention to our splendid stock of

WALNUTS

All grafts used by us are cut from trees of the very best type which Mr. Roeding has carefully observed and recorded for a period of years. In no other manner can standardization of established varieties be maintained.

There are thousands of acres throughout the great valleys in the Coast Counties which are being planted now and will continue to be devoted to Walnuts.

To those who have old walnut trees which they desire to work over it will give us great pleasure to mail our "Bulletin on Grafting".

PECANS

Of the eight or nine species of hickories the one which produces the most remarkable fruit and in the most profitable quantities is the Pecan. It is largely due to the impetus the Pecan industry has received in recent years that has encouraged the planting of trees on a commercial scale of the improved paper shell types. The trees thrive in a great variety of soils. Pecans will prove a valuable acquisition to our list of nut fruits in the warm interior valleys of California, Oregon and Washington.

PERSIMMONS

This splendid fruit, being a little out of the ordinary, is often looked upon as of no great commercial importance. However, it is, and those who avail themselves of the opportunity of planting an acreage this season, will undoubtedly profit by it. No garden is complete without them, and every orchard should contain its quota of Persimmons. Nearly everyone has eaten the ripe persimmon, but few have tasted the fruit when dried. It is delicious, and by many thought even to surpass the Commercial Date.

We shall be glad to furnish prospective planters with a list of the best varieties of Walnuts, Pecans, and Persimmons. Our illustrated catalogue lists and prices 2000 varieties of Fruit and Ornamental Trees, Vines, Plants and Roses—Sent Free.

The Active Garden Season

Written for California Cultivator By E. Braunton

NEVER has there been a time in any year that promised more favorable conditions or more encouragement for all gardening activities than February, 1917. It seems as though nature has been holding us back and making ready to spring all things favorable at one and the same time. We may sow, plant, transplant, divide or do anything we please with any sort of plant with a prospect of having everything in our favor. The garden season of preparatory and fundamental work will be short. The growing season is upon us. Then garden much and garden quickly.

Broadcast Annuals

Now is the finest time of all the year to sow annuals broadcast, either natives or exotics. Sown now they will soon be as large and strong as those sown at any time during the past three months, for little growth has been made during this time. In my own garden stocks and other plants put out in November have scarcely grown at all, and annuals then sown have been a quarter-inch above the soil without growth for 60 or more days. It is not therefore too late, but sow at once, especially native wild flower seeds.

Hardy Plants

Now is the golden season to look about and observe what so-called tropical fruit trees and plants passed unharmed through the recent cold weather. It has been a severe test not so much by reason of low temperatures as the unbroken continuance of cold nights over an unusually lengthened period. Avocados and all that type of fruit trees may now be judged if you find several varieties in your neighborhood. Then plant those only that came through the ordeal unscathed.

Divide Perennials Now

In many gardens there are old clumps of goldenrod, golden glow, phlox, Shasta daisies and other perennials of this nature that have remained undivided for years. They would thrive much better and yield tenfold or an hundredfold with superior flowers if broken up into small pieces and at once replanted in new, rich soil which has been turned over to a good depth. Some of these old clumps get so big that a large bed or a long border may be filled with the yield if only sufficiently divided.

A Valuable New Plant

Our readers are urged to look into the merits of a comparatively new plant now in bloom. It is Primula Malacoides, one of the small-flowering primroses. It grows vigorously and blooms most abundantly in shade or sun and in the cold and inhospitable nooks where other plants seldom thrive. In my own garden it has brought forth blooms when every night for a week the temperature dropped below the freezing point. Both plant and flowers remained unharmed. It is best not to allow the plant to go to seed, so that when the flower spikes are in full blow it is well to cut them for house use. And nothing could be daintier or more suitable for a small vase.

Famous Flower of the Alps

Last week I received through a Swiss consul several flowers from Switzerland, known to travelers under the German name of edelweiss, which is pronounced a-del-vice, and means in English, literally, noble white. The botanical name is from the Greek and in English is lions foot. The last or specific name of the plant means: of the Alps. The whole is Leontopodium Alpinum; leo, lion and podos, foot. It belongs to the composite or sunflower-dandelion family

It has been sought to surround this flower with an air of mystery and glamour. Tourists returning from Switzerland bring fine mounted specimens purchased as souvenirs of visits to that country and state such flowers are obtained only at great altitudes and at imminent risk of the collector's life, none of which statements are necessarily true. The flower flourishes in many upland meadows and valleys, not only in Switzerland but in surrounding countries as well. All that has been stated herein was for the purpose of "building a house of cards" so that I could knock it over by saying: "We grow 'em right in Los Angeles."

The edelweiss has been successfully flowered by several persons in California and is really becoming somewhat common in Atlantic coast states. It has even re-seeded itself there. It needs only sandy soil and splendid drainage, yet has been grown in a border of mixed plants under ordinary garden culture. The flowers are more curious than beautiful, though decidedly attractive. No one could tell by gross appearance that the flowers are alive, for they seem to have been made from a fine-textured creamy-gray flannel.

A Fine Floral Display

Rural visitors to Los Angeles should avail themselves of the chance to see a fine plant display in the city greenhouses in Eastlake Park. They are open and free at all times, and the grand plant and flower collection will well repay an hour or two spent in looking it over. Visitors from outside of the city, when having an hour to spare should keep this in mind. They will never regret such visits, which should be made once each month in order to see the various flower displays at their best.

Christmas Trees Scarce

Another industry that must soon spring up in the south end of the state is the growing of Christmas trees. Doubtless they will increase in price each successive year. They were higher last Christmas than ever before, and the prices already are enough to stimulate their growth on an extensive scale. I know of some nurserymen who sold such trees cut off at the soil surface for more than they would bring as balled plants for the garden, while the cost of handling transportation, etc., is considerably less. Christmas trees, Christmas holly and florists' greens will prove fine crops to grow in the near future.

Shortage of Holly

Every year there is a shortage of holly in the Los Angeles market and indeed a large part of our florists' "greens", also our moss, comes from Oregon. As San Francisco also draws on the same source, as well as many other cities, the time will soon come when advancing cost will make this material profitable to grow on hills of little use for other purposes. As all these plants are very ornamental it would prove a good investment to plant seeds or small plants on waste places for the only reason local florists do not use local material is because it cannot be delivered in sufficient quantities by responsible parties. Any red-berried plants will find ready purchasers, but the foliage is best smooth and shining.

The Chayote

Written for California Cultivator By D. F. Reichard

SINCE being introduced several years ago as a mere novelty the chayote (pronounced chah-yo-tay) has each year become more in demand until now it is a commercial article. It is offered for sale at most fruit stands and grocery stores during its season, which is from October to February.

A few cultural directions for the chayote are apropos at this time as this is the season for planting. Being a tropical vine it grows only in warm weather. The fruit, which envelops only one seed, is planted whole with the large end down, leaving the small end out of the ground. The young plant sprouts from the large end. Plant where they are to grow in well drained soil. Keep them only damp enough to allow good growth until warm weather comes on, when they will require lots of water. If the early sprouts are frozen back do not be alarmed as new growth will soon appear. The first year runners 20 to 30 feet will be made and probably some fruit. The winter frost will freeze these runners back to the root, but in the spring new shoots will come out and will grow to from 30 to 60 feet, which, if well trellised, will produce hundreds of fruits. During September the white, insignificant blooms begin to appear; in four or five weeks the small fruit are old enough for use. They are cooked and used the same as summer squash and eggplant.

Questions and Answers

ANSWERS BY EDITOR AND STAFF

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Canker

Will you please publish a cure for canker in chickens and turkeys, also something to prevent its spreading through the entire flock. We have a large flock of both chickens and turkeys and have just found that one of our fine gobblers is very bad with canker and three others are taking it. —Subscriber, Fairmead.

What is the cause of this disease which you call canker? Is it accompanied by symptoms of roup, running of the eyes and nostrils, a sickening odor about the head, etc.? Try dipping the heads a few seconds in warmish water which has been colored pink by a few crystals of potassium permanganate, and swab out the mouth well with either a strong solution of boracic acid or hydrogen peroxide, full strength. Have your birds been fighting? Male birds often pick one another in the mouth, causing wounds in which pus germs grow, making whitish patches which are also known as canker. Hydrogen peroxide, full strength or somewhat diluted with water, ought to cure this. How about mold in feed or litter? This is one of the most frequent causes of canker patches in the mouth. Use the peroxide and clean up. After swabbing out as much of the canker as possible with peroxide on a bit of cotton, wet the patches lightly with tincture of iodine. This peroxide and iodine treatment is to be applied only to the mouth. Do not try to reach into the windpipe even if you see canker patches there, which is not very probable. In cases where the yellowish deposit in the mouth is merely one of the symptoms of roup, the potassium permanganate treatment, with one washing out of the mouth, will usually be sufficient.—J. A. K.

Electric Motor For Pump

I have a 20-inch well with a two stage Byron Jackson No. 7 pump coupled up with a 40-H.P. gas engine giving about 125 inches lift about 45 or 50 feet. Water stands within 30 feet of surface before pump starts but draws down about 50 feet in summer. Would like to know if a direct connected motor would be the best or a motor with a belt as we are to change from gas to electric. What would be the best size motor to use and what make? Also I am to put up a 4000 gallon tank for domestic purposes along side of pumping plant and would like to know if pump will throw water high enough to go in tank, say 24 feet, high and if 5-inch pipe coupled on to the 10-inch discharge pipe of pump would be the right size? I am figuring on putting in a gate to close discharge whenever I want tank filled, and would like to know what is the best way to do so.—Subscriber, Puente.

If your pump and engine are working at good efficiency you should be using 30 horsepower to do your pumping and a 30 horsepower motor will be sufficiently large. It will not be economical to pump water into a tank set 24 feet higher than the present discharge since the pump will have to be run at a greater speed and this will consume power continually even when the pump is discharging at the lower level. The better plan will be to fill the tank by a small pump which is run by a small independent motor, or by a counter shaft driven from the large motor or pump shaft, and have the small pump receive its supply of water from the cement pipe at the head of your distributing system. Belt connection from motor to pump is more satisfactory than direct connection since the driving pulley can be changed for another size if more speed of pump is required because of lowering of the water level during dry years. The loss of power by belt connection should not be more than two per cent and this will be more than compensated for by having the motor away from the danger of water getting into it with the close connection. The tank can be filled as you propose and a five-inch pipe will be large enough, in fact any size of pipe can be used since the pump will not take up water which it cannot push out at the top.—J. B. N.

Unsigned Communication

We have an unsigned request for information regarding the tanning of rabbit skins, Had the subscriber signed his name we would have been glad to send copy of the Cultivator of March 16, 1916, containing an article upon this subject.

Third Term

Is there any law in the United States which will prevent a man from running three or more times for president?—Subscriber, San Martin.

We believe there is no provision of the constitution or any enactment touching upon this question. In declining a third term the country's first president has made an unwritten law which, like some other unwritten laws, have greater force, than those which are passed with much labor by our legislators. In his farewell message George Washington said:

"The period for a new election of a citizen to administer the executive government of the United States being not far distant, and the time actually arrived when your thoughts must be employed in designating the person who is to be clothed with that important trust, it appears to me proper, especially as it may conduce to a more distinct expression of the public voice, that I should now apprise you of the resolution I have formed to decline being considered among the number of those out of whom a choice is to be made.

"I beg you at the same time to do me the justice to be assured that this

Confidence

THE unseen merit in a tire determines its mileage value to you. This is why you must have the confidence that goes with the Firestone name. Confidence in the in-built quality—the hidden values which make Firestone Tires deliver Most Miles per Dollar.

Don't be without ELASTIC-GUM-COATING—the very best roof covering preparation you can buy. Has strongest endorsements of California users. It stops leaks, preserves the wood, and is easily put on with a brush. It cannot crack, scale, or blister, and it has the property, through its elastic composition, to allow expansion and contraction with changes in temperature. It will cover cracks one-fourth inch across and keep them closed. Lasts for years, preserving wood, steel, or iron. Just the thing for roofs, tanks, barns, silos, garages, chicken houses, etc.

TRIAL GUARANTEE OFFER. Send today for free descriptive circular and sample offer. ELASTIC-GUM-COATING is sold on trial under a positive guarantee of satisfaction OR NO PAY. If your dealer does not yet handle ELASTIC-GUM-COATING write direct to

resolution has not been taken without a strict regard to all the considerations appertaining to the relation which binds a dutiful citizen to his country; and that in withdrawing the tender of service, which silence in my situation might imply, I am influenced by no diminution of zeal for your future interest, no deficiency of grateful respect for your past kindness, but am supported by a full conviction that the step is compatible with both. . . . Satisfied that if any circumstances have given peculiar value to my services they were temporary, I have the consolation to believe that, while choice and prudence invite me to quit the political scene, patriotism does not forbid it."

Best Walnut Stock

Please advise best stock upon which to bud walnuts. What is considered the best variety of budded nut for interior valleys? Would like instructions regarding budding walnuts and transplanting in nursery rows.—Subscriber, Long Beach.

The stock usually preferred is the native California black. We think nurserymen are using this quite generally now though we believe some are using hybrids of California and Eastern black.

Incubator Eggs

Why do incubator eggs seldom rot like hen-set eggs?—Subscriber.

Any egg that contains a dead germ will rot whether it be under a hen or in the incubator. The only reason why hen-incubated eggs do rot more frequently is that they are not tested out so carefully. Every incubator instruction books says: "Test out infertiles and dead germs on the seventh day and test again about the fourteenth day for germs that have died since the first testing." If instructions are followed there can be no rots in the incubator, but how many people are as particular about testing the eggs they set under hens? Very few, I imagine. They think it not worth while to bother with such a small number, and so, before hatching time comes, the dead germs have rotted.—J. A. K.

Roosting in Trees

Why do hens insist upon roosting in trees through rain and cold if permitted?—Subscriber.

The tree is the hen's natural roosting place. Instinct takes her there, her oily feathers protect her fairly well, and if, as too often happens, she has to choose betwen rain and wind outside and foul air inside, it is not strange that she should prefer the tree. However, if a hen with a taste for tree roosting is compelled to roost inside a few nights, she soon forgets all about the tree.—J. A. K.

Crippled Chicks

Why do incubators produce crippled chicks and setting hens never?—Subscriber.

"Never" is a dangerous word. I have seen a cripple come from under a hen, but not often, and probably the cause was entirely different from that which produces cripples in the incubator. It is too high a temperature at hatching time that makes cripples of incubator chicks, but the hen's temperature never goes too high.—J. A. K.

Soil Binder

I have been referred to you for advice regarding soil binder. The property in question lies in the bottom of an arroyo and is planted to walnut trees. The soil is sandy and washes easily. When there are heavy rains quite a flood of water comes down the arroyo, leaving some of the walnut roots bare and others buried too deeply. Otherwise the trees do very well in this location.—Inquirer, Riverside.

There is no one plant which is good

to keep soil from washing under all conditions, and none will hold the soil under heavy flow in the winter and at the same time allow cultivation of the orchard in the summer. When there is but little water to handle the common green manure crops of vetch and melilotus will prevent washing. If the water should be deep but the movement slow there is nothing better than Bermuda grass, but if there is considerable slope to the ground something with a better root system is required. Pampas grass will withstand very heavy floods in most cases but will gather much sand and other debris if there should be slow moving water at any place. If the common black willow of the low grounds will grow on the land in question and is planted in alternate rows, four to six feet apart, with the pampas grass there is but little danger of the soil washing if all become well established before the first flood. Cultivation cannot be practiced if the latter method is adopted, and sufficient irrigation water must be provided to take care of the trees as well as the undergrowth. The trees cannot be expected to do their best under these conditions.—J. B. N.

Using Persimmons

Please advise if there are methods of preparing persimmons for the table other than using them in the raw state. I understand the Japanese dry them. How would they be used in the dried state?—Subscriber.

We are unable to find recipes for the use of persimmons, but certainly if we had a sufficient quantity of the fruit would experiment with the cooked product, perhaps combining with other fruits such as pineapple, and preserving in the form of jam or butter, adding if necessary a little lemon juice. The dried product could undoubtedly be used the same as other dried fruit, stewed, or for making pies or puddings.

Beans in Colusa County

Please give information as to best variety of beans for Colusa County, and general cultural directions. Also, what is the average yield where good care is given.—Subscriber, Colusa.

Best variety would depend largely on the purpose for which the crop was required. If purely for home consumption we would advise any of the following varieties: Dwarf types (green pod), Canadian Wonder, Selected Stringless and Extra Early Refugee (wax podded), Golden Wax, Imp. Rust Proof Golden Wax, and Davis White Wax, which latter is also valuable for a shelled bean in winter, and for shipping purposes. If a pole bean is required Kentucky Wonder is about the best. Beans require a fairly retentive soil, and the richer the soil the heavier the crop is likely to be. However, a very essential factor is careful and constant cultivation between the rows after the beans are up and in active growth. They should be planted about April and, if as a small garden crop, the dwarf types may be sown in succession every month or three weeks until July or August. The seed should be planted in rows 20 inches apart and when thinning out leave plants four inches apart in the row. The quantity of seed required is: Dwarf type, one pound to a 100 foot row or 50 pounds to the acre; pole type eight ounces to a 100 foot row or 25 pounds to the acre. The crop matures in about 40 to 50 days for Dwarf beans and 70 to 80 days for pole varieties. The yield depends largely on the season, which varies and soil conditions. However the average yield would be from 25 to 35 bushels per acre. It is essential that the soil should have been deeply cultivated before sowing. If it is proposed to grow beans for commercial purposes on a large scale the Tepary, a small bean which yields 1200 pounds to the acre and thrives in dry districts and other places, is well worth growing, and as the quality becomes more widely known it will fetch big prices. The Pink bean and Navy bean are also very popular and always command good prices. For more detailed information watch the monthly notes. —A. R. G.

JOHN DEERE IMPLEMENTS

BOOK FREE 156 page reference book—tells all about a complete line of farm implements and how to adjust and use many of them. A practical encyclopedia of farm implements. Worth dollars.

Describes and illustrates Plows for Tractors; Walking and Riding Plows; Disc Plows; Cultivators; Spring Tooth and Spike Tooth Harrows; Disc Harrows; Alfalfa and Beet Tools; Farm and Mountain Wagons; Manure Spreaders; Inside Cup and Portable Grain Elevators; Corn Shellers; Hay Loaders; Stackers; Rakes; Mowers and Side Delivery Rakes; Hay Presses; Kaffir Headers; Grain Drills; Seeders; Grain and Corn Binders.

This book will be sent free to everyone stating what implements he is interested in and asking for Package No. X-111.

JOHN DEERE, MOLINE, ILL.

John Deere Plows for Light Tractors

So far as quality of John Deere Plows for Light Tractors is concerned, they are built for the farmer who realizes that it is business judgment to buy a high grade tractor plow. Don't forget that a tractor plow is not an everyday purchase.

John Deere Plows for Light Tractors are noted for their high grade work in the field—the real test of tractor plow value.

Before you make your purchase, be sure to see John Deere Plows for Light Tractors. A careful purchase means a permanent saving.

The John Deere Light Tractor Disc Plow works with any standard tractor—the hitch is adjustable.

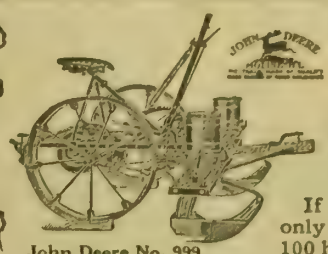
Three or four discs.

Discs have a double setting. Taking care of all conditions where a disc plow can be expected to operate.

Adjustable scrapers keep discs clean and lighten the draft.

No choking in trashy ground—frame is high, beams are dropped, which gives good clearance under the frame, and there is plenty of room between the discs for trash to pass through.

John Deere Corn Planters



Accuracy in a corn planter means uniform drop—number of kernels the same in each and every hill.

If the planter misses only six kernels in every 100 hills, the loss in yield is nearly two bushels per acre.

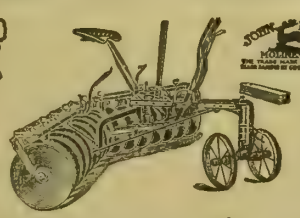
Accuracy in planting has been the main object in designing John Deere planters. One of the many advantages of using a John Deere planter is that with proper handling it will plant practically 2, 3 or 4 kernels in every hill, as desired.

John Deere No. 999 is accurate. It has the John Deere *Natural Cell Fill, Edge Delivery Seed Plate.* Surface of hopper bottom and openings to seed cells are oblique, or sloping. Kernels move toward and enter the cells in their natural position. They do not have to be tipped on edge.

Merely move foot lever to change number of kernels per hill.

Drilling distances varied, and change hilling to drilling or back to hilling made easily.

John Deere Model "B" Disc Harrow



Using a disc harrow before plowing pulverizes surface lumps, works trash into the seed bed and prevents the escape of moisture. Then when the furrow slice is turned, the trash decays rapidly and no large air spaces are left between bottom of furrow and the turned furrow slice. Water in the subsoil can make its way into the seed bed and plant roots can penetrate to deeper soils.

Discing after plowing removes the weeds, and makes the seed bed compact, but not hard. The discs break up lumps of soil.

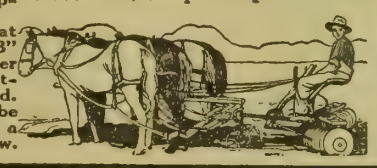
The Model "B" pulverizes at even depth its entire width.

Patented spring pressure third lever—inner ends of gangs can be given light or heavy pressure to disc over ridges or cut out dead furrows without burying the harrow.

Independent gangs. All tendency of gangs to crowd to one side is easily overcome by giving them the proper relative angle.

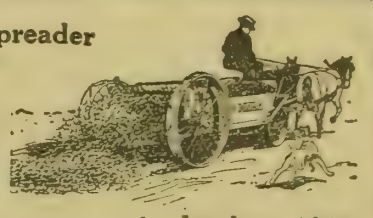
Flexible—only that part of the Model "B" harrow passing over an obstruction is lifted out of the ground.

Rear section can be furnished to make a double action harrow.



John Deere Spreader

The Spreader with the Beater on the Axle



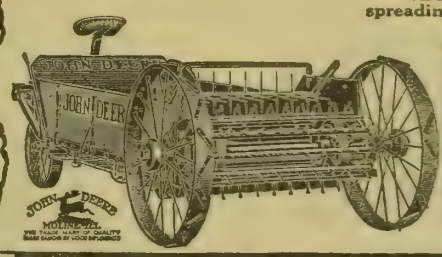
Mounting the beater on the axle simplified the construction, eliminated troublesome parts and made possible a successful low-down spreader with big drive wheels. There are no shafts to get out of line, no chains to cause trouble, and no clutches to adjust. The only spreader with beater and beater drive mounted on axle.

Low down, with big drive wheels out of the way. Easy to load.

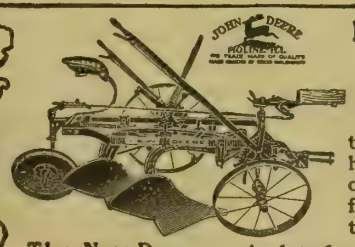
Revolving rake, driven by manure moving toward the beater—no bunching of manure. Ball bearing eccentric apron-drive—a new and exclusive driving device.

Makes uniform spreading certain.

Wide spread attachment for spreading seven feet wide can be furnished for the John Deere Spreader. No chains nor gears. Quickly removed.



New Deere Light Draft Gang Plow



For twenty years the New Deere Gang has had the good opinion of enough farmers to make it the one best seller—

And, today, it is the same plow it was twenty years ago, with the usual minor refinements added.

Correct in design, always representing the highest development of the plow-maker's art, the New Deere Gang is a leader, and has been every single year for twenty years.

Go to your John Deere dealer's and look this plow over—you will readily see why it is such a popular plow.

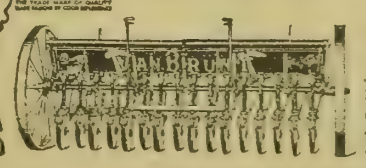
The New Deere Gang is the most widely used plow of its type.

It is light draft, durable and is equipped with John Deere bottoms, known all over the world for superior work, easy scouring and light pulling qualities. It cuts and turns full width of furrow.

A simple, practical foot lift and auxiliary hand lift lever—easy to raise bottoms out of the ground.

John Deere Quick Detachable Shares—great labor and time savers. Share can be taken off easily, only one nut to remove.

Van Brunt Grain Drills



Van Brunt Drills are particularly noted for their adjustable gate force feed. Each feed cup plants exactly the same amount. The seed is compelled to leave the seed box in even, continuous streams without bunching or choking up. All the ground is seeded.

The Van Brunt Single Disc is the first successful single disc grain drill with closed delivery. The seed is protected by metal seed tubes, disc openers and the disc boots until it reaches the bottom of the furrow.

Van Brunt Drills plant any small seed.

Amount sown per acre easily regulated.

Direct, double, gear drive from the continuous axle.

High-grade discs with bearings guaranteed to last lifetime of drill. Scrapers keep discs clean.

Pressure springs individually adjustable to make uniform depth furrows.

Either single or double discs.

Grass seeder attachment which will drill or sow broadcast can be furnished.

Fly Control Work for the Winter

Written for California Cultivator By E. Ralph de Ong

THE fly problem has received much attention in the summer months, but is generally neglected in the winter, which means hordes of flies living all winter and ready to deposit eggs as soon as warm weather comes.

Everybody knows that flies are to be fought through the summer, but when they stop annoying us in the fall, the fly campaign stops. Hosts of them live through the winter, waiting for the warm days before they deposit their eggs; don't stop work because the fly is hiding, one killed now is worth a thousand next June.

Very commendable work has been done in many communities by means of summer campaigns against the fly. True, much of the effort was directed toward the offender after he has been in the milk and on the table and visited the manure pile to deposit some eggs—, but something has been accomplished. It is natural for us to strike first at the thing we see or that is bothering us, but later we associate our tormentor with the maggots in the manure pile. With the coming of fall our homes and stables are fairly well supplied with flies until the frost "kills" them, but if you will put those "dead flies" in the sun for a few minutes most of them will be found crawling about; the cold has stupefied but not killed them. Many of them die through the winter, it is true, but there are always plenty of them that live over.

Place a saucer of formalin solution (one teaspoon of formalin or formaldehyde to a saucer of water) where the flies are congregating, and if no other liquid or fruit is available they will take it freely, dying in a few minutes. This chemical is not as dangerous as arsenic, it being comparable to wood alcohol. If the solution is to be used in the kitchen, all water should be removed and the sink covered, so that they are forced to feed on the formalin. A little milk or sugar added increases its efficiency.

Stables and hog pens can be cleared of the over-wintering fly most readily by spraying with light distillate oil or kerosene, used at 12 per cent or 15 per cent strength: Distillate oil, 12 gallons, soap, 7 pounds, water, 88 gallons.

If the water is hard one or two pounds of lye should be added to the above amount before pouring in the soap solution. The latter is added in order that the oil will mix with the water. In a well made emulsion free oil will not separate out of the emulsion for several minutes.

The spraying should be done early on a cold morning while the flies are somewhat stupefied. Spray the walls thoroughly and in a few minutes the flies will be dead on the floor.

The Farm School

Written for California Cultivator By J. M. Davison

SOME months ago there was started a movement looking toward the establishment of a school somewhere in Southern California, similar to the one at Davis. The thought in the minds of those who launched the movement was that there was no work that could be done by our great University of California that was more important than the work of insuring a larger measure of success to the tillers of the soil. This movement has been commended by many organizations, and at the coming session of the state legislature a bill will be introduced asking for the appropriation of a sum of money sufficient to make a substantial start toward such a school.

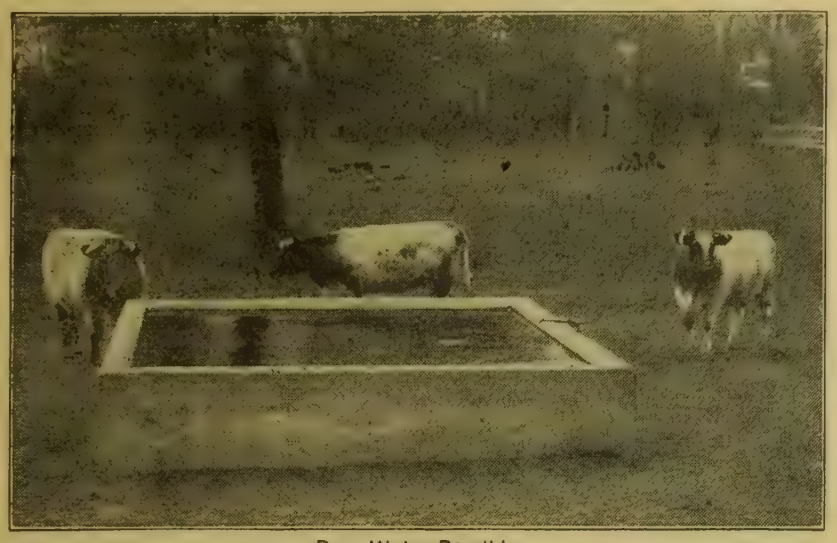
It is not my purpose to give a history of the movement or what organizations are supporting it or what steps will be taken to secure favorable legislation, but I want to plead for simple justice to hundreds and hundreds of our Southern California ranchers. My contention that justice is not being given to many of our ranchers is best borne out in a statement of my own experience.

The early part of my life was spent on a farm in the Middle West, and then for 20 years I was in the mercantile business, but the desire to till the soil was ever present and six years ago I sold my mercantile business and bought a ranch in Southern California. I brought to my ranch the experience gained raising hogs and cattle, corn and oats, in the great corn belt, and not many months had passed on my California ranch until I realized that my life on an Illinois farm fell far short of making me an efficient rancher in Southern California. I learned by sad experience the lesson that so many others have learned, that the willingness and ability to put in long weary hours of labor did not guarantee a reasonable measure of success, unless that labor was intelligently applied, under conditions vastly different from all my previous experience. Accordingly there was but one thing for me to do and that was to secure from somewhere such information as would enable me to realize the most from my labors.

In the states with which I was most familiar, Illinois, Missouri and Kansas, I knew that the state universities were giving more and more attention to the work of helping solve just such problems as now confronted me and I wrote to the University of California to learn what provision was made for the almost countless numbers who were trying to procure agricultural success in Southern California. It was then that I learned of the Davis school, both the regular course of study and the Farmers Short Courses and as it was entirely out of the question for me to take the former, I made my plans to get all the good I could out of the latter, and the day that the Farmers Short Courses began in the year following my moving to the state I was enrolled as a student.

It is not the purpose of this article to tell of the usefulness and efficiency of the school at Davis. We all know that the teaching of agriculture is still in comparative infancy, and with the cumulative knowledge that will come from years of experiments and experience, better and better teaching will be done. But I do want to say that in my judgment every rancher in the state who would take the Short Course would be a better rancher, both financially and intellectually, and that in many many, cases the result would spell the difference between success and failure.

My own approval of the school is evidenced by the fact that although the round trip means approximately 1000 miles of travel, yet after my own experience my wife also enrolled and enjoyed the advantages of the school and later my two sons put aside their college work for a year that they might take the Short Course. Accordingly I feel competent to speak for the work done at the school and for the results achieved, and my plea is for a broadening of that work so that its helpful influence can be felt by more of our Southern California ranchers.



Pure Water Possible

In the beginning I spoke of injustice being done to many of our ranchers and I will now explain what I mean. From the best information I can secure, I learn that there are approximately 50,000 householders moving to Southern California every year. A great many of them of course go to swell the population of our cities and towns, but a great many like myself, have purchased a ranch and expect to make their livelihood by farming. Many of these are doomed to certain disappointment and failure, are totally unfit to cope with the new and changed agricultural conditions they find here, and will wear out their lives and break their hearts as they see the savings of years take wings and fly away, in spite of all they can possibly do. It is for these that I plead for, except in very rare cases, the barrier of distance is an impassible one for our Southern California ranchers.

If I had not enjoyed the privileges of the farm school and did not know the stimulating helpfulness that comes from it, I would not be so insistent, but I crave for all my co-laborers in this part of our great state the same advantages I received, knowing it will mean a higher plane of agricultural life; and I cannot see any other possible solution of the problem than the planting of some such school where it will be of easy access to the thousands who need it here in our great Southland.

Peruvian Alfalfa

Inasmuch as considerable interest is being manifested in the hairy type of Peruvian alfalfa, the results obtained by C. C. Bowles of Calipatria, Imperial Valley, should prove interesting to the readers of this magazine. In a letter to one of the large seed houses, Bowles says:

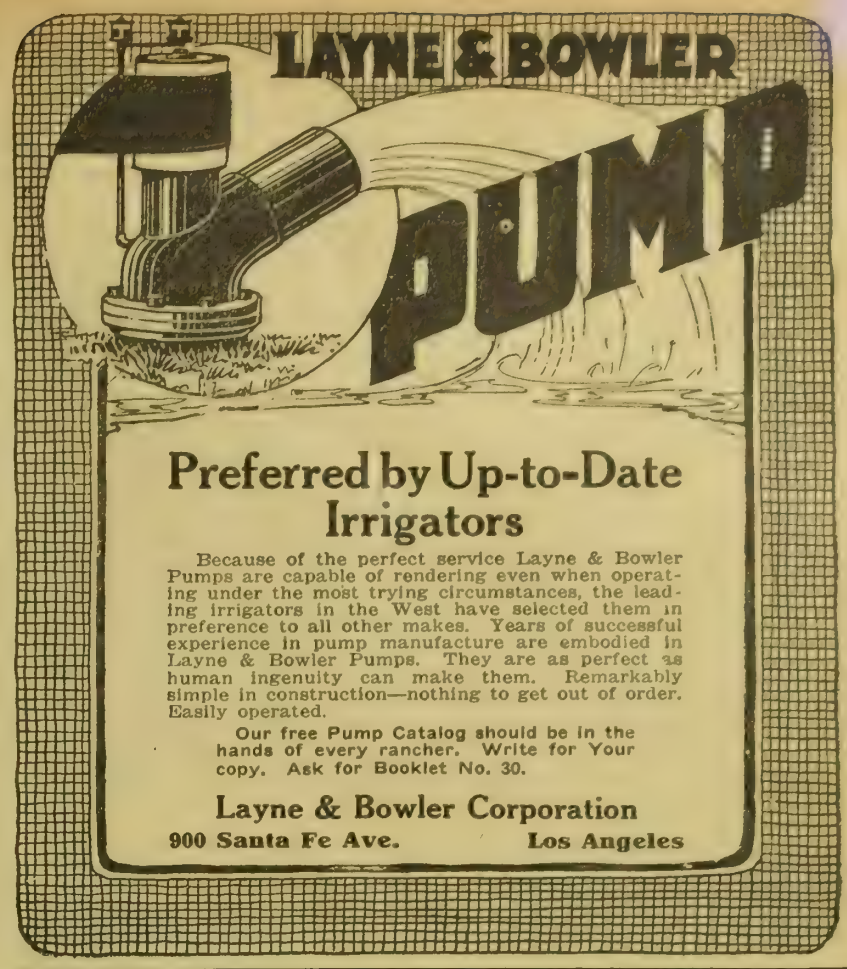
"I now have 200 acres in hairy Peruvian alfalfa. The foliage of the plants is more dense than other varieties, the leaves coming out in clusters all along the main stem. The common alfalfa has a leaf short and round like the clover. The hairy Peruvian has a long slender leaf shaped like a rabbit's ear and is covered with a fine coating of hair.

"I have a field of smooth Peruvian which I re-sowed with hairy Peruvian. In passing through the field after our recent cold weather I found the smooth Peruvian wilted and yellow as if touched by fire. It had been frozen to the ground while the hairy Peruvian standing beside it was as green and thrifty as in mid-summer. I call that a fine demonstration, I have about 80 acres of smooth Peruvian mixed with the common alfalfa which I will probably plow next fall and sow in hairy Peruvian, as the hairy variety seems to withstand the rigors of this climate best both winter and summer. Others will soon make the change when they see the superiority of the hairy Peruvian demonstrated."

J. F. Nicholson, agronomist of the college of agriculture of the University of Arizona, in commenting on this new type of alfalfa, said, "The quantity of hairy Peruvian alfalfa seed is very limited and the demand is growing rapidly in our section, which would tend to advance the price considerably over that of common alfalfa seed. Some of the seed houses may sell alfalfa seed which is probably a cross between hairy Peruvian and the common variety at comparatively low prices. As a matter of fact all Peruvian is hairy, but in order to obtain the real article it is necessary to distinctly specify Hairy Peruvian."

The following statements are from reports made by the University of Arizona on hairy Peruvian alfalfa: "We find that the hairy Peruvian is a more hardy winter grower, more upright and more prolific. We particularly get better cuttings early and late than we do on the common or any of the other varieties of alfalfa that we have tried. We find that the hairy Peruvian maintains a good stand for a long period of time without re-seeding. In the Yuma and Salt River valleys it gives at least two cuttings more than are obtained from other varieties. It thrives at a much lower temperature than ordinary varieties, which gives a late fall or winter pasture. It also revives much quicker, which permits early spring cuttings. In cutting for hay it outyields the ordinary varieties from 15 to 20 per cent."

Nothing along the line of farm records gives so much in return for the time spent as a farm inventory, for it shows not only the profits for the year, but enables the farmer to make a thorough study of his business.



Preferred by Up-to-Date Irrigators

Because of the perfect service Layne & Bowler Pumps are capable of rendering even when operating under the most trying circumstances, the leading irrigators in the West have selected them in preference to all other makes. Years of successful experience in pump manufacture are embodied in Layne & Bowler Pumps. They are as perfect as human ingenuity can make them. Remarkably simple in construction—nothing to get out of order. Easily operated.

Our free Pump Catalog should be in the hands of every rancher. Write for Your copy. Ask for Booklet No. 30.

Worn Out Soils Made Productive

by using

Hauser's Organic Fertilizers

Science and practice both indicate that Nitrogen and Phosphoric Acid are necessary to produce the best results from the Citrus Orchards, and these two essentials are most prominent in organic fertilizer. Hauser's Organic Fertilizer is a concentrated soil builder and fruit producer. Put back into the soil at least a portion of the natural elements the orchard has taken out.

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertiser in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

THIS WEEK'S COVER

When one speaks of dates he thinks of Northern Africa or Southwestern Asia or, if he happens to be a Californian, of the Coachella and Imperial Valleys, which sections are now proving their worth as producers of some of the finest dates in the world. The industry will grow and we believe ultimately prove a great factor in exporting fruit from California. But to give an idea of the great range of this industry we use this week on the cover a photograph showing date tree growing in Tulare County. Our guess is that Tulare County will not be a producer of dates in a large commercial way but their production in that section is possible.

PREPAREDNESS

The department of commerce is issuing a statement or rather makes an appeal to American manufacturers and merchants to prepare for peace. Attention is called to the fact that European countries, while straining every sinew for war are extending their commercial operation in almost every direction. Even now Great Britain is contemplating establishing trading banks in various South American countries and that centralization of ecenomic resources will enable the government to encourage its merchants, as soon as peace enables them, to seek the markets of the world. The circular then adds: "Cooperation in this country for purposes of foreign trade is a necessity. If our merchants are appealing to cooperation to develop trade, the necessity of cooperation for the producer is even greater. We can only imagine the conditions which will obtain after the war is over and reconstruction begins, but no matter what the conditions are cooperative effort will result in success far quicker than if we permit ourselves to compete with ourselves in our fruits, dairy and meat products—everything.

LIVE STOCK SHOW

Los Angeles is exceedingly in earnest in its effort to secure a live stock show next November or December. Last week's Cultivator called attention to the fact that there is some live stock in that live section. Breeders in all parts of the state have signified their willingness to compete with these breeders and show all their stock if arrangements can be made for such an exposition. Plans are in the making and as soon as the committees now at work can make definite announcement the Cultivator will be glad to give it, but California, both at San Francisco and at Los Angeles must have live stock shows. Portland has pulled off a most successful one for many years; there is no reason why California should not have the same advantage.

AGRICULTURAL SCHOOL

The agricultural teachers of Los Angeles County are appealing for support for the Evans bill which provides for the establishment of an agricultural school along lines similar to those of the university farm at Davis. In their campaign they call attention to the fact that Los Angeles is the banner county of the Union in products of the field and orchard. A county of such agricultural importance should not be 500 miles from its great agricultural educational institution. In addition attention is called to the difference in climate and the fact that many while still too young to make their homes away from their parents' desire to take up agricultural work; also to the fact that the Davis institution, according to Dean Hunt's report, is already filled to its capacity, and other facts which justify the passage of this bill.

The state school at Davis has proved of great benefit to California; a similar institution in the South will prove equally as profitable as a state investment. Not only is Los Angeles County pushing for this school, but many other counties are urging the passage of this bill. Most convincing points are given in the article by Mr. Davison on another page of this issue. Mr. Davison knows whereof he speaks.

COWS AND COWS

The report of the University of California as to December work of cows entered in the state dairy cow competition shows a range in the individual cows from a production of butter fat of 115.676 pounds in the month to 30.149 pounds. Ninety other cows ranged all the way between these two extremes.

Perhaps at first the owner of the 30-pound cow may be a bit discouraged; rather he should be encouraged to make the 30-pound cow over into a 100-pound cow. This will be something like David Starr Jordan's breeding a lap elephant—he could do it if given time—and the time required in that case would be some 6000 or 7000 years. Fortunately, however, it does not take that long to make a good dairy cow. It does, however, take intelligence and greatest attention to detail, and the best advice we can give in this matter is to "go to it.". The sire is half the herd or as Mr. Lamson better expressed it at the recent swine breeders meeting, "The herd boar is one-half the herd the first generation, three-fourths the herd the second generation, and seven-eighths the third generation, etc., ad infinitum."

Is the head of the dairy the son of a cow which produced large in quantity and high in quality? If not, send him to the block and start again.

FIRE LOSSES LESS

Orchardists and everyone depending upon irrigation water which comes from California watersheds have made such a strenuous fight for preservation of the watersheds that fire losses have greatly decreased during the last score of years. The losses are still severe enough to be a menace to many fruit sections for the average loss because of timber burned was last year for each timber owner $559. The preceding year it was $660, before than, $750, and in the year 1913, $1215. But this loss of timber producers is infinitely small compared to that of the irrigators, so that there is much encouragement in this record. Rangers employed by the department of agriculture are responsible for much of this saving. We believe more credit is due to the campaign of education which has been carried on with all those who have occasion to visit our forest reserves and other mountain sections during the dry summer months. It may be earlier than necessary to begin to be careful for the next dry season, but the gospel of greater care should be passed on every season of the year.

POULTRYMEN COOPERATING

Every year the poultrymen of California have felt the necessity of uniting and securing more just returns for their labor. During the past two years a partially successful organization has been in existence. Perhaps we should say, "entirely successful", for it is now instrumental in organizing the association which will, we believe, prove of greatest value to the producers of poultry products. The increase in the production in California has been very great. There has likewise been great increase in cost of all poultry feeds. The production at this period of the year has become so great that home consumption is not sufficient to keep down the surplus. Where will this surplus be marketed? Answer will be given by this association we believe in a way which means help for the discouraged industry. The work of the two years was practically completed on last Thursday when 279 members of the new association gathered in Los Angeles and elected directors for the first year. The new association has th entire confidence of many producers, and while it has not unlimited capital it will have sufficient to give a thorough test of the marketing plan. State Commissioner Weinstock is uniting in helping the poultrymen, and this association, like the similar, though much larger one in the northern part of the state, will be given every help possible. The most embarrassing feature at this moment is the fact that many poultry producers refrain from joining and leave their products to be thrown into the market in competition. This is neither fair to themselves nor to those who would save the industry, but the trouble with cooperative effort is that it cannot succeed where people are not educated to it. If every poultryman in California, not a member of one of these great associations, should proceed to inform himself of this cooperative plan, we believe it would result in greatly increased membership.

Agricultural Notes

Alberta's spring and winter wheat crop amounts to over 41,000,000 bushels.

The present population of the United States is given as 101,882,479 in the annual letter of the secretary of agriculture.

Australian dried fruit growers have an organization with membership among apricot, peach and raisin growers. The 1916 pack amounted to 17,266 tons.

Argentine is becoming a grower of rice. A competitive exhibition of rice was recently held in Buenos Aires. Last season's drouth caused loss of about one-third of the crop.

By a recent enactment the Spanish government is empowered to seize any food materials, fix their price, transportation, etc.—this as an emergency measure during the war.

To make a study of the native potato and alfalfa that grow at high altitudes in Peru the University of Colorado and the Denver Chamber of Commerce are sending Dr. M. M. Ellis.

Prices for New Zealand wool of the grade "Superior Merino Combings" is reported as 37-45 cents. This is being paid by the English government which has purchased New Zealand's entire clip.

The University of Missouri is organizing for this year boys' and girls' clubs in corn growing, pig feeding, calf feeding, poultry management, potato growing, tomato growing, canning, baking and sewing.

An effort is being made to increase use of American butter and cheese in China as there is an opening through withdrawal of supply formerly coming from Russia and Siberia. No export of dairy products is now allowed from that country.

UNIVERSITY OF CALIFORNIA STATE DAIRY COW COMPETITION

Ninety-two cows have already been entered in the state dairy cow competition. The average production of 66 of these cows for the month of December was 1223.7 pounds of milk and 57.27 pounds of fat. The highest producer was cow No. 1 of the contest, Aaggie Acme, a Holstein cow, the property of A. W. Morris & Sons. Her production was 2794.1 pounds of milk and 115.676 pounds of fat. The lowest producer of the 92 cows produced 30.149 pounds of fat. Aaggie Acme is a six-year-old cow but she is far from the oldest in the contest. One, a Jersey, property of Mr. Bomberger, is 15 years and two months old. Her production for the month was 55.760 pounds of fat. Other cows range in age down to two and a half years. Producers running over 90 pounds for the month are Aaggie Acme, Morris & Sons, 115.676; Hartog Cremelle, Morris & Sons, 92.186 pounds; Auralia De Kol, Morris & Sons, 93.580; Athalva 2nd, Holstein, Palo Alto Stock Farm, 92.971; Boweda, Holstein, Vina Ranch, 99.667.

Cows producing between 80 and 90 pounds are Abbie De Kol of Eastbank, H. E. Cornwell, 87.578; Butternut Queen, Guernsey, Elliott-Brant Ranch, 85.439; Champion Figgis, Holstein, J. A. Goodall, 82.553 pounds fat; Willowmar Vesta 4th, E. B. McFarlane, 81.354 pounds; Korndyke Duchess K., McAlister & Sons, 87.559.

The University of California farm has one large producer in Korndyke Senorita, a Hereford, which has been on test 18 days, in which time she has produced 51.270 pounds of fat.

Members of cow testing associations should bear in mind that the period for entry for the California Cultivator $300 prizes ends on March 1. Write at once to Prof. Woll for revised rules in this feature of the contest.

Agricultural News Notes of the Pacific Coast

Northern California

Napa County has organized a farm loan association.

A state highway is proposed from Truckee to the Nevada line.

Placerville, Eldorado County, is considering a $5000 bond issue for the purchase of a civic center.

A $500,000 bond issue will probably be voted on in the near future to complete work on the Anderson-Cottonwood irrigation district.

Supervisors of Sacramento County have been petitioned to call an election for the formation of a Wright irrigation district at Fairoaks.

The highest herd average for over 20 cows is reported by O. P. Gillian of Dixon, Solano County. The average is 1.1 pounds fat per day per cow.

The Clear Lake national farm loan association has been formed in Lake County, taking in the territory of the fourth and fifth supervisoral districts.

Hop growers of Sonoma County have taken preliminary steps toward the formation of a marketing association along the lines of the raisin association.

Corning, Tehama County, has report from a high-toned Eastern cafe that three of its large Sevillano olives sell for 40 cents when served in that institution.

Grammar and high school boys of Woodland, Yolo County, have started agricultural and gardening contests. Vacant lots in the city will be used for the boys' work.

Plans are being made for Fresno's celebration of Raisin Day April 30. Miss Oneida Madison, daughter of Manager Madison of the association, will be queen of the festival.

In discussion of plans by the farm bureau for Yolo County's next county fair it was decided to bar the university farm from competition for prizes, but to invite it to make exhibits.

An association of local land owners about Palo Cedro in Shasta County has formed an irrigation company under the name of the Big Cow Creek Ditch Company. It will put about 1400 acres under irrigation.

Shipments of pears from Eldorado County this year amounted to 70,055 boxes. One hundred and seventy-three carloads of fresh fruit were shipped East from Placerville, not including several cars of wine grapes.

President Stephens of the Pacific Rice Growers' Association advises Sacramento Valley growers to hold their crops. He says that within 60 days it is fairly reasonable to suppose that they can get two and a half cents.

The Cloverdale Citrus Fair Association is making plans for its 24th annual. Officers elected are G. Hagmayer, president; J. W. Schmitz, vice president; W. W. Furber, secretary. The Bank of Cloverdale is treasurer.

Supervisors of Sonoma County have passed a resolution favoring the loop highway connecting Sonoma, Lake and Mendocino Counties. The proposed road would run from Cloverdale to Lakeport, thence to Ukiah. The road from Ukiah to Cloverdale is already built.

The University of California has announced farmers' course at the Davis school May 29-30, June 1. There will be several courses in live stock, fruit raising, culture of field crops, etc. The main idea to be followed out in this farmers' course is method of reducing cost of farm production.

Central California

Stanislaus County has advertised for bids for county fair grounds.

Stanislaus County is considering buying permanent fair and exposition grounds at Modesto.

The Peach Growers' Association will soon begin construction of packing plants at Reedley and Selma.

Delta farmers are planting a heavy acreage to onions. Eight thousand acres at least will be planted.

The Fresno County committee of the Central Stockmen's Association has launched a membership campaign.

J. H. Peters of Bakersfield is president of the Kern County farm bureau which now has a membership of 449.

There is a renewed effort in Merced County to organize a farm bureau and secure the appointment of a farm adviser.

San Joaquin Valley growers are planning heavy plantings of potatoes. Planters are paying fancy prices for their seed.

Live stock men of the San Joaquin Valley are uniting with the packers in financing the Universal Packing Company at Fresno.

An all-day vine pruning demonstration was given Friday, January 12, at the Kerman Union high school farm by Prof. F. T. Bioletti.

In 1916 there were 33,390 visitors to Yosemite, a gain of 1748 over 1915. Private automobiles entering the park numbered more than 4000.

Shipments of raisins during the month of December were nearly four times the shipments for December, 1915, amounting to 19,721 tons.

The 1916 raisin crop is 2000 tons over last year's. The largest increase was in Thompson's Seedless, which gained 100 per cent over last year's tonnage.

At the recent annual meeting of the Coalinga Poultry Association all old officers were re-elected. Plans are being made to bring the next state poultry show to Coalinga.

The statement is made by grain dealers that nearly 200,000 bags of barley and wheat were this season handled in the warehouses at Ducor, Terra Bella, Orris and Lois.

The United States department of agriculture has established a station of the bureau of entomology at Fresno to study grape insects. The station will be in charge of R. L. Nougaret.

The Melvin Grape Growers' Association held its first annual meeting and banquet at Clovis, January 12. Manager Nagle of the California Fruit Exchange was one of the speakers.

At a meeting of grape growers at Dinuba, January 10, a resolution was passed endorsing the present grape standard of 16 per cent of sugar for Emperors and Cornichons and 17 for Malagas.

At the recent fig growers' convention at Fresno a resolution was passed favoring an organization of fig men. Prof. W. H. Clarke of the state university was empowered to appoint an organization committee.

The Tagus Ranch of Tulare County recently sold 900 head of Angus beef cattle to a Los Angeles packing house. The cattle are to be fattened on cottonseed meal at the ranch until delivery, which will be extended over the time between now and May.

Southern California

This year Imperial Valley will gin between 125,000 and 150,000 bales of cotton.

The new packing house at Sunshine has been completed and is ready for handling oranges.

California's apricot crop for this year totalled 10,900 tons of dried and 289 tons of fresh fruit.

The Pomona Progress recommends as one use for cull oranges feeding to porkers and producing orange bacon.

The Riverside Press estimates that the orange and lemon crop for California the coming year will total 51,150 cars.

The new plant of the California Associated Olive Growers at Fallbrook, San Diego County, has begun canning olives.

Several hundred acres have been planted to onions in the Coachella Valley, as well as a considerable acreage to garlic.

San Diego County's farm adviser is collecting samples of honey to aid in standardizing the product throughout the county.

Experiments were made at Imperial cotton gins with small green bolls which were frosted. The cotton was found satisfactory.

Farm loan associations in San Diego County have been organized at El Cajon, Escondido, Encinitas, Fallbrook, Ramona, Julian, Chula Vista and La Mesa.

The Imperial Date Growers' Corporation has imported several thousand date palms from the Persian gulf to set on lands in Imperial and Coachella Valleys.

Three thousand boxes of oranges have just been shipped from Rialto to Australia. The fruit is packed in the regulation export Imperial bushel box weighing 54 pounds.

Lima bean growers in the vicinity of Encinitas and Del Mar, San Diego County, are considering organizing a branch association of the California Lima Bean Growers.

Apple growers of the Yucaipa district are busy now pruning their trees. It is estimated that at least 100,000 boxes will be shipped out of the valley next season.

The next meeting of the Coachella Valley Date Growers' Association will be held at Coachella March 12. W. L. Paul has been elected president and F. W. Zabler secretary.

Upland, San Bernardino County, is beginning its heaviest packing of oranges. The fruit has been a little slow in sweetening and packing was delayed until it was at its best.

The 1916 walnut yield of Southern California is estimated at 12,150 tons. This, although nearly 3000 tons less than the 1915 output, because of high prices received brought in as much money as last year's crop.

It is announced that there will be a Northern California and a Southern California Fair Association this year, the Southern Association to include Riverside, Kern, Los Angeles, Ventura, Imperial and probably Kings Counties.

A cow testing association organized by the Imperial County farm bureau is said to be the largest in the United States. That at Ferndale is second. The Imperial Association has 4000 cows on test, the Ferndale association 2500.

The Coast

Many stockmen of Arizona are digging wells on the ranges and putting in windmills.

The Idaho State Horticultural Association will hold its annual meeting at Boise, January 30.

The annual meeting of the Arizona State Poultry Association was held at Phoenix, January 13.

The Idaho State Honey Producers' Association held its annual convention at Twin Falls January 8-9.

The girls' canning clubs of Arizona last season canned a total of 5363 quarts of vegetables and fruits.

Eastern Washington was caught by the early December freeze and many potatoes and even apples are yet unharvested.

Dairymen of Skagit County, Washington, have formed an association to market their products. There are now 150 members.

A poultry show will be held at Moscow, Idaho, January 22, under the auspices of the University of Idaho and the Moscow Poultry Association.

The government has just completed the feed canal to supply water to the reservoir for the Hermiston irrigation project, the cost being approximately $40,000.

Twenty herds are being tested in the Truckee-Carson cow testing association. Average production of butterfat per cow during November was 23.77 pounds.

Because of the large demand for condensed milk, due largely to the European war, two big new condensaries are in course of construction near Bellingham, Washington.

According to the Southwestern Stockman-Farmer three times as much cotton will be grown in the Salt River Valley in 1917 as was grown the past season, thus bringing up a big labor problem.

Cooperation was the main subject of discussion at the recent 24th annual convention of the Washington State Dairymen's Association at Auburn. It is probable that an association will be formed in the near future.

Cotton growers of the Salt River Valley are projecting a plan of organization which will divide the growers into eight districts, each to have one representative in the central council, with one vote to each 1000 acres represented.

Grain farmers of Apache and Navajo Counties of Arizona through their organization have reached 75 cents per hundred above market price for their oats. The association has adopted Swedish select oats as the standard for the valley.

The Washington state public service commission has allowed the Northern Pacific to establish a rate of 30 cents per hundred pounds on apples shipped to Olympia from Kennewick and intermediate points. The fruit will be used by the fruit canneries and fruit juice plants.

The Yakima Valley, Washington, Fruit Growers' Association announces receipt of advices from General Freight Agent Lounsbury of the Oregon-Washington Railway & Navigation Company that the company has arranged to grant the reduction in the freight rates on apples into New Mexico and adjacent territory, for which Yakima shippers have long been contending.

Have your harness dipped

Let your harness dealer dip it occasionally in Eureka Harness Oil. Quickly done, costs little, but adds years to the life of your harness. It pays.

EUREKA Harness Oil

protects the leather from sweat, moisture and dirt by filling the pores with preservative oils. Ask your dealer today.

The Type We Are Breeding For

Hardy, prolific sows of best blood lines and breeding. Strong, upstanding, prepotent boars. In short the best possible specimens of the Berkshire breed. We plan to do this by breeding large numbers and from them making a rigid selection.

James Mills Orchard Corporation
Hamilton City, California

CALIFORNIA STATE SWINE GROWERS CONVENTION

Continued from Page 91

fectionately called by all intimate friends, is probably the widest known and best loved breeder in America. For 43 years Mr. Lovejoy has been breeding swine, and his record of achievement both in show and sale ring have made history. Mr. Thompson said in his introductory remarks that the convention felt highly honored to have the distinguished gentleman from Illinois present and asked the breeders to work Mr. Lovejoy to the limit with questions during the session. Mr. Lovejoy was president of the Chicago International Show and the Illinois state fair for years, and has judged hogs at hundreds of shows.

Professor Thompson announced that Mr. Washburn, vice president Western Meat Company, San Francisco, being called East, could not deliver his address in person, Mr. Thompson read Mr. Washburn's paper, and it is of so much importance that we publish it word for word elsewhere in this issue.

After Mr. Thompson had read the Washburn paper H. I. Marsh of Modesto told how their shippers' organization up there had recently sent six carloads of grain finished hogs to San Francisco which dressed out over 81 per cent. These hogs brought 10.27 per hundredweight. The packer who bought them paid a premium of ten cents per hundredweight for each one per cent the animals dressed in excess of 77 per cent.

Mr. Frank Hausr of the Hauser Packing Company, Los Angeles, was next on the program. As Mr. Hauser was considered the spokesman for the Los Angeles packing companies, he had more than his share of questions to answer. His subject was, "Why Strictly Grain Fed, Milk Fed, Acorn Fed, etc., Hogs All Bring About the Same Price In California." The morning session had been comparatively quiet, and everybody was on hand again after lunch expecting to hear some warm arguments, and they certainly had their expectations gratified. Up to the time of Mr. Hauser's address questions from all parts of the hall flew thick and fast. So fast did they come that the packers and breeders alike could not answer them rapidly enough. Essentially these questions were all the same. The big drawing card of this convention was the marketing question which confronts the California stock raiser. Sometimes he gets a premium and sometimes he does not get it. One grower says he does not get any more for a grain finished animal than his neighbor gets for one finished on alfalfa. The packer says he don't want the poor hog at any price. So it can be imagined how peaceable and quiet this meeting was for awhile. Finally Mr. Hauser walked up on the platform and after a few preliminary remarks he repeated the subject of his address and answered it himself by saying, "It is not so." Every phase of the market hog business in California from the time pigs were born until they reached the packer he reviewed. He told about the poor quality of pork that comes into this market, that the packers were forced to buy a large part of their pork products from the East because the Western farmers sent such undesirable stuff to market, that the packers kept strict account of each shipper and the quality of his animals, that large numbers had to be condemned for disease, etc. In fact Mr. Hauser aired every grievance of the coast packers in a clear, concise manner, and then concluded his remarks by saying that the packers wanted to get together with the producer and apply a remedy for existing evils which would be satisfactory to both parties. It was at this juncture that J. L. Thatcher of Riverside arose and said: "As breeders and producers of hogs in California, we who feed well and produce a first class market hog have our bellies full. It has come to a point where we must be paid higher price for our top grade hogs or go out of business, as present prices of feedstuffs are too high to feed at a profit under present conditions. We want the packer to discriminate and punish the shipper of poor hogs in the same ratio as he rewards the shipper of good hogs." Then followed the appointment of the committees. Mr. Cunningham appointed R. B. Peters, Devore; J. L. Thatcher, Riverside; and William Bernstein, Hanford, on the swine breeders committee, while the Hauser, Wilson and Cudahy packing companies selected a committee of three among themselves. Both parties met after the convention was concluded.

Prize Calf Herd of F. D. Ross

The one big question being on the way to a final and satisfactory solution the convention now turned its attention to one which has a mighty influence on the successful application of the other—"How to Market Hogs in California." Harris Weinstock, state market inspector, answered this all important matter in a brilliant, able manner. "From a lifetime of experience in marketing various farm products I have found that the only way in which the producer can ever accomplish any tangible results is by organization. When 70 per cent of the stockgrowers of California band themselves together in a wide awake, efficient organization their power will be so great that the marketing of their product will be easily solved. At present your organization represents but 15 per cent of the state swine growers." Mr. Weinstock cited the citrus and raisin industries as an example of what cooperative organization can do. He told about the private capital being subscribed in the Sacramento valley to build a stockyards where growers could ship

their stock. "Right here," said Mr. Weinstock, "we have the ultimate success of all our discussions and thrashing out of questions which are puzzling the trade. With central markets established we will then get the little local markets where the small shipper of less than carlots can send his stuff, have it graded, and then sent to market." He concluded his remarks by offering his time and effort in the cause and was deluged with a volume of applause which shook the building.

D. O. Lively was the final speaker on the program. His subject was: "What Has Been Done and Should Be Done For the Good of the Swine Industry in California." He told about his experience in the campaigns for growing more and better hogs in various parts of the United States, how the same problems of the California growers were overcome in other communities, and advocated a public stockyards as soon as possible at the large and small centers, showing by comparison and figures what a stockyards had meant to other sections. Mr. Lively's remarks on stock shows were terse and interesting in view of the agitation for shows at San Francisco and Los Angeles this year. He pointed out the many advantages of well conducted and well patronized shows, their educational value, and finally their value to the state. He advocated large premium lists to induce Eastern breeders to bring their herds out to the coast to compete with our own herds, citing the fact that during the past five years Pacific coast bred livestock of all varieties had beaten Eastern animals in the show ring every time they had been entered. He showed the advantages to the California breeder of coming in competition with his Eastern brother, and that one such victory as the California stock won at the 1916 International show at Chicago was worth millions of dollars to the state.

The meeting was adjourned for the day after Mr. Lively's address, and after dinner the delegates were entertained at the theater.

Friday was devoted to visits to the Los Angeles packing plants where the visitors were royally entertained. They were shown the difference between a good and badly finished hog, and saw California hogs compared with the Eastern product. It was noteworthy that the best home-grown product was fully as good as the Eastern brand. All present expressed appreciation of the hospitality and fine treatment the Los Angeles people accorded the swinegrowers while in the city. Three cheers and a unanimous vote of thanks were tendered the packers after the appetizing lunch served at Hauser's plant.

There were over 300 people in attendance at the Thursday session and fully as many in the party which visited the packing plants on Friday. They came from all over the state and many from outside the state. One and all, they expressed themselves as having enjoyed and profited by the convention. Mr. Lovejoy remarked that in 40 years' experience he had never seen such an enthusiastic meeting of swine growers nor had he ever seen so much accomplished in such a short time.

Why Swine are Lower in California Than in Oregon or the Middle States

From Address By F. L. Washburn Before Swine Growers at Los Angeles

QUST who the originator was of the lengthy caption, which I am supposed to cover, I really do not know, but whoever it may have been, was assuming a condition which does not exist, and has not in the past; it further assumes that there is something radically wrong with the conditions under which our hogs are marketed, that the packer may have much for which to apologize, and possibly a profit out of proportion to the rewards received by the raiser of the hogs.

By referring to the year book of Swift & Company recently issued, you will note that their actual payments per cwt. at all plants for hogs during the year 1916 was $8.49, while the average paying price of our company for the same period was $8.43, a difference of only six cents per cwt., or between 10 cents and 12 cents per hog.

It is further a remarkable coincidence that the average price paid at all the Swift plants during the year 1915 for live hogs, was $7.09, which happens to be the identical cost of our entire purchases for the same year.

I wish to further draw your attention to the recent bulletin of the department of agriculture, which announces that the average market price of hogs throughout the United States during the year 1916 was $7.40 per cwt., while in 1915 the average price was $6.10, indicating that our average paying price for the year has been more than a cent higher than the average market price throughout the United States, notwithstanding that our figures include the cost of all light weights, inferior hogs and other undesirable stock.

The records of our company's receipts of hogs are available for the last ten years, and I can say definitely that only in the years 1915 and 1916 has California made any progress in hog raising, our average weekly receipts for the years 1915 and 1916 being slightly more than double the average weekly receipts of the previous eight years, but regardless of this increase none of the Pacific Coast packers are doing a business large enough to rank with many of the smaller plants in the Middle West.

The average weight of our hog receipts for the year 1915 was 179 pounds and in 1916, 177 pounds, which is an average fully 20 pounds under the most desirable weights. Hogs marketed in 1916 have shown a yield of only 75.1 per cent as compared with the yield of 76 per cent for the year 1915. Too many light unfinished hogs are being marketed.

The people of our state are good consumers of pork products as long as the particular products happen to be ham and bacon; beyond that their interest seems to wane, and coast packers have a very poor outlet for pork loins, trimmings, tongues, spare ribs, neck and back bones, kidneys, tails, leaf lard, Boston, boneless ham butts and shoulders.

On account of the poor demand for pork loins, trimmings and other products, our company has been obliged to ship considerable quantities of frozen pork east, with a freight and icing charge amounting to $2.35 per cwt. on the net weight shipped.

As before mentioned, it is an easy matter to sell 25 per cent of the live weight of the hog in hams and bacon, but the remaining 75 per cent needs the

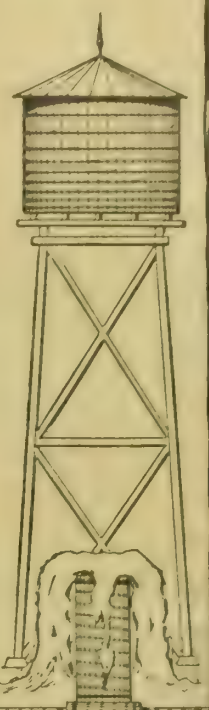
Remco

SILOS

For dairymen, farmers, feeders in all sizes and proportions.

TANKS

For water, wine, oil, vinegar, acids for storage, mixing, fermenting, pickling.



PIPE

For irrigation, power, water supply, in all diameters and for all pressures. Costs less than any other pipe of equal efficiency and endurance. Outlasts any pipe except cast iron.

All Remco products are manufactured to your order from clear, air-dried redwood. Their outstanding features are highest grade material, superior efficiency, maximum durability, true economy.

Sold direct to users. Catalogs sent on request.

REDWOOD FOR DURABILITY

Santa Anita Rancho
Anoakia Breeding Farm

ARABIAN-THOROUGHBREDS: Two-year-olds, sired by Imported Stallion Ibn Mahruss, head of our Arabian stud. Dams are the choicest thoroughbred mares of Santa Anita Rancho.

SADDLE HORSES: Some of which were sired by Ibn Mahruss, world renowned Imported desert saddle stallion, and Don Castano, a five-gaited Kentucky saddle Stallion. These horses are mostly three year-olds.

POLAND-CHINA AND BERKSHIRE BOARS: Four to nine months old. Sired by famous Poland-China herd boars Banker's Boy and Glenview Wonder. And Berkshire boars, Kintyre Laird, Grandson's Duke and Fashion's Longfellow 5th. The dams are from the very best blood lines. Most all these animals have winnings at World's Fair. Write for catalogue.

HOLSTEINS: We will sell a number of young bulls. Some sons and grandsons of the noted Prince Gelsche Walker, and bulls from one World Record cow and two California State Record Cows. Write for details.

INNISFAIL DAIRY SHORTHORNS

GLENSIDE ROYAL 408155.

Our herd of registered Shorthorns has been carefully selected from the leading milk producing strains of the breed and is being developed along the same lines in our hands.
The herd is headed by
GLENSIDE ROYAL
a prize winner at the 1913 International and grand champion at Panama-Pacific Exposition.
Sired by him and out of large cows of good milk production we offer for sale a few choice young bulls.
Our entire herd is tuberculin tested.
Alexander & Kellogg, Suisun, Cal.
Farm on Grisly Island.

There are many reasons why you should always buy advertised goods. They are guaranteed.

Don't Let Your Horse Waste Your Money

Use a

TRUE BLUE *HERCULES* SWEAT PAD

They prevent chafes, galls, and shoulder bruises.

They cost only a dollar, a pair, and may save many dollars just at a critical time when your horses should be in condition to work without interuption.

A sound horse does more work than one having bruises.

TRUE BLUE *(Hercules)*

Sweat Pads fit any collar, and are made of heavy strong drilling filled with a composite especially prepared for horse comfort—mainly deer-hair.

When a dealer offers you a *Hercules* Harness, Horse Collar or Saddle, he is offering you *THE BEST THERE IS.*

assistance of education in the merits of fresh pork, and I dare say that the city of Pittsburg will consume more fresh pork and sausage in one day than the entire bay district of San Francisco in a week.

Permit me also to mention the comparatively large business done by retail butchers in whole hogs. The desirable so-called block hog weighs from 90 pounds to 125 pounds dressed weight, and this weight is considered too small to make a satisfactory packer hog. Now, this is the type of hog which sells to very poor advantage, usually at from one cent to one and one-half cents per pound live weight under the price of heavier hogs; the comparatively large number of light hogs turned off being a further handicap to the packer, as the retailer, who might otherwise be using fresh pork cuts, is able to buy these cheap dressed hogs and work off the small cuts fresh to his trade. In the past, such a large percentage of the fresh pork consumed, has come from these block hogs, that the producer has had no trouble in selling his light hogs which reach, for example, the weight of 130 to 140 pounds per head, with comparatively small expense. If, instead of rushing off these lightweights, the producers would finish them to a packer size, say 175 pounds to 250 pounds, the large number of lights would be eliminated with gain both to the producer and distributer.

By way of explanation, the packer cannot afford to handle extremely light hogs, for the cuts when cured and smoked are not merchantable as No. 1 stock, on account of their undesirable shrivelled appearance; furthermore, the dressing percentage decreases correspondingly with the weight of the animal.

Now as regards market quotations and the matter of shipping direct to a packer, as compared to public stock yards, this is a matter on which I do not care to take sides. Our company has been purchasing hogs for direct shipment for many years, and it is my belief that in all this time, with very few exceptions, every producer that has come in direct touch with us has been satisfied; he has known exactly what he would secure if he had good stock, and his shipments have been subject to no fluctuations of the market, except in his favor. Will further add that a number of important plants in the Middle West purchase hogs in this manner as well.

For a record I attach the market reports on January 15. 1917, showing market reports from Chicago, Kansas City and Omaha. There are more hogs marketed at Missouri River points than in Chicago, and the Missouri River markets as a rule range from 15 cents to 25 cents lower than Chicago.

The range of prices at Omaha on January 15th is as follows:

Heavy, 10.30 to 10.70. Light, 10.00 to 10.50. Pigs, 8.50 to 9.75. Bulk of sales 10.30 to 10.60; the Omaha top being 10.70.

The tendency in going over market quotations is to figure that one's own stock will always bring the top, but this is a long way from what often happens, and a shipper is just as likely to market his hogs near the lower limit of the spread as he is at the high limit.

I must touch on the matter of condemnations in hogs before closing. Tuberculosis is the principal cause of these losses, and apparently there is very slight, if any, improvement, except with those who are deeply interested in the success of the hog business.

The cause of tuberculosis in hogs is well known to you all, and this has come to be such a serious menace that for the past year our company has been charging one-half of the condemnation loss to the shipper, and we have assumed the other half after allowing full credits for salvage.

From a compilation made by the government inspection service at our establishment 72, I find that in 1916 a total of 25,751 head were retained as suspects, on account of showing signs of disease. The total percentage of condemned amounted to 3.2 per cent, of which 2.2 per cent were condemned for grease, and one per cent were condemned for sterilization. I might add that we have not been able to make any use of the privilege of disposing of pork products passed for sterilization to pay out any better than by making lard out of such cuts.

Losses from cholera have not been important, save in isolated cases; it would appear that cholera is under good control.

As advantageous distributing centers, our coast cities can hardly be compared with Chicago, Omaha, Kansas City, etc., which have two-thirds of the country's population to draw on, and I dare say that outside of a comparatively small section of Nevada and Arizona, our packers do no business in pork products, outside of our own state (except in shipping surplus products East that should be selling here), the matter of freight rates being an all-important regulator.

Add to this condition the wonderful demand for pork products from the war zone, especially Belgium, which has existed for the past two years, and which has given us no direct benefits; as none of our pork products have ever found their way across the water, the eastern packers having this broad market to sell on, with the remarkable demand from manufacturing sections in particular and the whole country in general.

There are some good hogs being raised and finished in California, and when we consider that real hog raising is not much over two years old, I believe that the business has made good progress. One year ago the hog market was on a very low basis, both in the north, east and here, and in 1916 you have been handicapped by high grain prices. In the Middle West the farmers have always raised and fattened hogs continuously in good and bad years, and in some sections have considered themselves fortunate if their herds were not wiped out with cholera oftener than once in five years, and I have heard many eastern farmers say that without their hogs they could never conduct their farms on a profitable basis.

The California hog is still laboring under the old stigma that was attached to him when tule roots, acorns, etc., were his chief diet, and it sometimes happens even now, that a shipper will make the mistake of sending the packer something on this order.

The majority of our consumers have been so trained by years of listening to the propaganda that eastern smoked meats were superior to those produced here, that many eastern brands of meat and lard command a preference to which they are not entitled. The California housewife should ask for smoked ham, bacon, lard, etc., that are produced in California. She will not regret her choice.

In order to promote the work of

marketing choice finished hogs we have been paying premiums of 10 cents per cwt. on each full unit in the dressing percentage over 77 per cent, and this plan has worked out quite satisfactorily. The average yield of hogs handled at coast plants is, I would say, at least three per cent less than the general average at packing plants in the Middle West.

In speaking of our own business, our pork department has never been uniformly profitable, and I believe the same situation exists with other coast packers. I have always considered this business is one which needed constructive up-building, and we are just beginning to realize the first of the results that can be obtained only through close cooperation of producer and packer, and we believe the more direct the contact the more cordial will be the situation, we are willing to work along any legitimate lines that can be suggested for the ultimate benefit of the industry.

As regards the future of the market, it appears that we can look for high prices as long as the present export demand continues, as well as the heavy consumption in the manufacturing centers of our country. Right now the prices of live hogs, cured meats and grain are all abnormally high and I dare say that conditions governing hog raising will show further improvement with the advent of normal prices for feed, even though the hog market may be relatively lower.

Stocks of cured pork products and lard are quite heavy, and receipts at Eastern points are most generous, some enthusiastic boosters even predicting 12 cent hogs, but these high spots in the long run may be almost as detrimental as periods of depression.

In conclusion, I will summarize the principal handicap under which the coast packers are working, in spite of which we are paying on the average as good prices as they are in the East:

Excessive condemnation.

Lower yields.

Poor demand fresh pork cuts and sausages.

Prejudice against california cured meats and lard.

Excessive percentage of light unfinished hogs marketed.

Local packers get no benefits of high export markets on packing house products.

When these conditions are overcome and a well balanced demand created for all the products of the hog there is no reason why hog raising in California should not prove one of the most profitable industries on the Pacific Coast.

California Wool Growers Association

The California Wool Growers Association held its annual meeting at the University of California Farm at Davis on January 5 and 6, 1917, President C. A. Kimble presiding. There were about 35 sheepmen in attendance. It was considered the most successful meeting in the history of the organization. The 640-acre homestead law, increased grazing rates in the forest reserves, and the value of rice stubble for sheep were discussed.

A number of demonstrations were held, Professor R. F. Miller in charge. A carcass demonstration was given comparing the weight and value of the market cuts of a choice mutton lamb and an old Merino ewe. Two stud rams in full fleece were sheared, a Rambouillet and a Romney Marsh, the former shearing 27.2 pounds, while the latter sheared 19.8 pounds. Three methods of docking lambs were demonstrated, namely, the knife, the docking pinchers, and the Ellenwood docking iron. The docking pinchers and docking iron are used hot and prevent loss of blood, the latter having special advantages over the old way of cutting the tails off with a knife.

A very instructive feature of the afternoon was the result of the feeding-test with 424 old ewes, which had just been completed. After a discussion of the results of this test the feeding lots were visited where the differences would be more readily appreciated upon seeing the two lots of sheep. The various breeds of sheep at the farm were also on display.

At seven o'clock in the evening a mutton banquet was served at the University Farm dining hall, 37 being seated at the table. F. A. Ellenwood acted as toastmaster and the following speakers were called upon: George Pierce, Professor Gordon H. True, L. L. McCoy, D. O. Lively, Dr. H. J. Hammond, President C. A. Kimble, and Dean Thomas Forsyth Hunt.

Officers elected: President, L. L. McCoy, Red Bluff; Vice-President, C. A. Kimble, Hanford; Secretary, F. A. Ellenwood, Red Bluff; Treasurer, F. N. Bullard, Woodland.

At the 19th annual meeting of the O. I. C. Swine Breeders' Association, held in Chicago, officers elected were: President, A. M. Foster of Illinois, secretary and treasurer, O. C. Vernon of Goshen, Indiana. The association passed resolutions withdrawing support from the White Breeders' Companion, which had been the official organ of the association.

EASTERN JERSEYS ARRIVE AT RIVERSIDE

After thoroughly combing the Middle West for the right kind of foundation dairy stock J. M. Roberts, field agent in California for the American Jersey Cattle Club, has arrived in Riverside with a shipment of pure bred Jersey cattle for the Riverside Jersey Breeders' Association. Twenty-one head were in the shipment, including five cows, 12 heifers, and four young bulls, two grandsons of Golden's Fern's Noble, one of Oxford You'll Do, and one of Oxford's Majesty, while the females were of the Golden Love's Son breeding. Golden Love's Son blood is very popular in the Middle West and can be found in most of the high producing herds in that section. Every animal came through in splendid shape and they are now conveniently housed in spacious quarters awaiting their dispersal which will be done in the very near future.

Unsigned communications receive no attention.

Loss of Flesh

I have a cow that freshened in June with her third calf but has not come in heat since. She seems in good health but is thin in flesh and I am unable to put her in good condition. I am feeding stock beets, carrots, bran, alfalfa and oat hay. Am feeding what hay she will eat up without any waste. She was on rye pasture before coming fresh. I wish to breed her again if possible. What do you advise?—Subscriber, Beaumont.

Have her examined by a veterinarian as there may be something wrong with the genital organs from her last calving. Or possibly she may have tuberculosis. The case is one that is hard to diagnose without examination.

Scours

I have a heifer that was recently returned to alfalfa hay from salt grass pasture where she has been for a year. Upon calving she has contracted a severe case of scours that seems to be growing chronic. I feed her dry hay and have given her scalded bran and water for drink but have made no great headway in checking the disease. What would you advise doing for her? —Subscriber, Hemet.

Overfeeding of the alfalfa and the sudden change of feed may have started the scours. Feed her sparingly for a short time and give oat hay or corn fodder part of the time in place of the alfalfa. Also give her these powders: Powdered gentian three ounces, powdered zinziber three ounces, bicarbonate of soda three ounces, powdered nux vomica two ounces and tannic acid one ounce. Mix and divide into 20 powders. Give one powder twice a day for four or five days, then one a day while they last.

Shoulder Slip or Sweeny

I have a five year old riding and driving horse that suddenly became lame after being ridden in hilly country. Haxe examined leg and shoulder thoroughly but can find nothing unusual. There are no signs of splint, ringbone or similar troubles nor inflamation anywhere. Horse is just as lame whether used or not and on soft ground as well as on hard. I think the trouble is in the shoulder but have examined it in every way and can not make him flinch. Can you give me any idea what the trouble is and what to do for it? It has continued for over two weeks.—Subscriber, Ducor.

Probably the trouble is shoulder slip or sweeney. Somewhere in your travels in the hilly country the horse probably stepped on a rolling stone or a slippery place and the leg and shoulder were suddenly thrown forward. Such lameness might not show much until the next day when the muscles would be swollen but not noticeably. In time this swelling would subside and the muscles shrink below normal and still the change not be very noticeable. If it is shoulder lameness you can probably make him flinch by lifting the foot and pulling the limb straight forward or straight back. Or the lameness might be in the ligaments around the shoulder joint from the same cause. This would show by pressure on the joint with your knuckles. You may be able to cure him with this liniment: Equal parts of turpentine, spirits of camphor, tincture of capsicum, aqua ammonia, alcohol and olive oil. Shake well and apply once a day. If the muscles shrink away in spite of the liniment then it may be necessary to inject the muscles with equal parts of turpentine and alcohol. Inject the solution into the muscles in several places with hypodermic syringe. This treatment may need to be repeated in two weeks but one treatment is usually enough. You should have a veterinarian do it for you.

Buy Berkshires

--AT--

Public Auction

Thursday February 15, 1917

DAVIS, CAL.

Fifty head of Berkshire hogs, the choicest individuals from 15 leading Western herds, will be sold under the auspices of the

Western Berkshire Congress

at University Farm, Davis, Cal.

February 15th

At the International Live Stock Exposition, Chicago, Berkshires won Grand Champion and Reserve Grand Champion carload over all breeds, and Champion Dressed Carcass over all breeds. Berkshires are money-makers.

This sale affords wonderful opportunity for procuring the very best foundation stock, the best of breeding, the best of individuality, and they will be sold to the highest bidder.

Purebred Registered
HOLSTEIN CATTLE
Fifteen thousand dollars in prize money, for milk and butterfat production, was distributed among breeders of registered Holstein-Friesian cattle during the year ending April 30, 1916. The official supervision, by the Advanced Registry Office of the Holstein-Friesian Association, of all regularly conducted tests, and the award of liberal prize money have proven a mighty stimulus and an educational factor of great value, in the promotion of interest and progress in the breeding of Holstein cattle.

A Great Holstein Herd Under the Wing of Mount Shasta

Written for California Cultivator by C. E. Hughes

ABOUT two years ago the writer visited the registered Holstein herd owned by The McCloud River Lumber Company, located within some 14 miles of impressive snow-capped Mt. Shasta. Among other impressions of the herd I find this paragraph which I published in Livestock and Dairy Journal:

"The McCloud River Lumber Company was unfortunate enough to lose its herd sire, Sir Korndyke Hengerveld De Kol 31st. This bull was a son of Sir Korndyke Hengerveld De Kol and out of Grace Ormsby De Kol Hengerveld, an A. R. O. cow with a seven-day record of 29.60 pounds butter. A number of his calves are now in the herd, and they are a fine, straight, vigorous lot. The writer noted especially three heifer calves that should land right close to the top of our best calf classes at the fairs."

Recently the writer again visited The McCloud River Lumber Company, and my, oh my, how quickly those heifers do grow up into regular dairy cows! Of the three good heifer calves noted in the preceding paragraph I found two on official test. And before speaking of individual production I want to say that the records now being made in this herd are remarkable in that all of these heifers just ran in pasture until within a few days of freshening time, so there was absolutely no preparation for test, and they all freshened in thin flesh. Beyond this, as this is the first lot tested in the herd, they have not had the benefit of experienced feeding. In fact, their ration under test is exceedingly simple.

It does not always happen that the best individual heifer makes the best record, but is so in this story. McCloud De Kol Parthenea, a junior two-year-old that would look mighty well in any man's herd, started on test with more than one handicap. Besides lack of preparation she was so lame in one foot that she could not bear it on the ground. In spite of these things she went ahead and made over 17.5 pounds butter in seven days early in test. She recovered from her lameness and immediately began to increase in production. At this writing she has been in milk over 30 days and is still increasing in production, now milking around 72 pounds per day. Her best seven-day records to date are 505.1 pounds milk and 20.62 pounds butter, and her best 30 days 1919.8 pounds milk and 78.64 pounds butter. She thus becomes the California champion junior two-year-old for seven and thirty-day milk production under official test.

The other of the two heifers that caught my fancy two years ago is McCloud Hengerveld Geertje. Freshening as a senior two-year-old she has just completed official records of 436.1 pounds milk and 18.37 pounds butter in seven days, 1845.1 pounds milk and 76.83 pounds butter in 30 days. She also is a splendid individual carrying a good udder with rare veining.

Of the five other two-year-olds to be tested so far, McCloud Minita De Kol made 366.3 pounds milk and 17.03 pounds butter. McCloud Imogen De Kol made 322.5 pounds milk and 15.11 pounds butter. McCloud Quidee De Kol made 328.2 pounds milk and 14.63 pounds butter. McCloud Beauty Virgo made 296.8 pounds milk and 14.40 pounds butter, and McCloud Bonheur De Kol made 359.1 pounds milk and 13.63 pounds butter. All of these seven heifers are daughters of Sir Korndyke Hengerveld De Kol 31st, and are all of his heifers that have freshened so far. The seven average 16.25 pounds butter in seven days, which is an exceedingly good showing for heifers put on test right out of pasture and handled under test by men inexperienced in test work.

Several of the older cows have also been tested, and their records are not only creditable in themselves, but they will be of great value later on as their daughters go under test. Of these older cows Geertje Canary De Kol made 452.3 pounds milk and 19.86 pounds butter in seven days. The 10-year-old cow Geertje Marie De Kol made 437.8 pounds milk and 17.93 pounds butter, while her 14-year-old dam, Geertje De Kol, who is also the dam of McCloud Hengerveld Geertje, made 376.6 pounds milk and 17.05 pounds butter in seven days.

These are the records to date, but they are enough to show very conclusively that the right blood is in the herd, and that it will require only proper feed and handling to bring out some great records in this herd.

The herd now contains about 130 head of registered animals, and the writer sees a wealth of good material in it, particularly among the young heifers coming on.

Among the heifers in the herd are especially to be noted 15 daughters of Sir Korndyke Hengerveld De Kol 31st, seven of which have freshened and gone under test as previously mentioned. This is a particularly good group.

Then there are 24 daughters of McCloud Prince Ormsby. The writer picked out of the heifer calf herd what he believed to be the most promising youngsters on the place, not knowing their breeding at the time, and later on found that every one selected was a daughter of McCloud Prince Ormsby. This young sire is bred in the lines that are making dairy history today. He is sired by Sir Ormsby Hengerveld De Kol, 66 A. R. O. daughters, and is therefore half brother to Pietertje Maid Ormsby, 35.56 pounds butter in seven days, and to Gracie De Kol Ormsby, 33.32 pounds butter in seven days, and to Aaggie Texal Wayne 2nd, 30.59 pounds butter in seven days and 1077.72 pounds butter in one year. He is also

P&O
LIGHT DRAFT PLOWS
Built for the Field Test.
Three-Quarters of a Century of "Knowing How" Hammered Into Every One of Them.
The product of the Parlin & Orendorff Co. has always been noted for simplicity of construction, great strength and ease of operation. It was upon such a basis that the founders of this business made their implements, established their reputation, and built their factory. It is upon the same foundation that the business has been carried on to this day, and in 1917 we celebrate our Diamond Jubilee; 75 years of practical experience gained through constantly striving to provide for the exacting requirements of three generations of American farmers.
For an even three-quarters of a century we have met the demand, and today we operate the largest and oldest permanently established plow factory in the whole world. "It's the way we build them."
P&O
Light Draft Plows, Harrows, Planters and Cultivators are made in all types and sizes, to meet the conditions in all sections, and are Backed by an Unqualified Guarantee.
We also make the most complete line of Traction Engine Plows produced, and we have a special catalog devoted to these famous plows.
The P&O Little Genius Engine Gang Plow
was the most popular plow shown at all points on the 1916 National Tractor Demonstration.
We will send P & O Catalogs to any address. While P & O Implements are sold only through established implement dealers, we welcome correspondence from farmers in all sections.

Famous Blackhawk Shires

AGAIN demonstrated their superiority by their winnings at the 1916 California State Fair.

At this fair Blackhawk Shires won all first prizes except two, and in one of those classes had no entry.

A mare bred and developed at Blackhawk Ranch won Grand Championship over imported mares of the first quality, thus demonstrating the quality of stock we are breeding right here at home.

Anwick Arthur and his get again won the California Stallion Registration Board Special, for stallion and three of his get, over all breeds.

Do not Forget that Blackhawk Shires Won 68 Prizes at the Great Exposition Show at San Francisco in 1915.

If you need a first class Shire stallion or mare we can please you from a wide selection that have weight, quality and right draft type.

Our Shires are bred and raised under good healthy breeding conditions—they are not pampered—and we deliver to you horses in breeding condition that will breed, and at a price well within their value. Correspondence invited. Visitors welcome.

Get Rid of the "Boarders"

Do you keep cows or do they keep you? Do you know which are earning a profit and which are merely paying their board? One community increased the average net profit per cow 129% in a few years by testing. Cows from regularly tested herds sell for more money and so do their offspring. Knowing beats guessing in dairy work. Get our free booklet, "What is Accomplished by Testing Cows" and learn how to build up your herd from animals of known production. Every farmer should read this booklet. It's free. Send a postal today.

GOLDEN LAD
JERSEYS
YOUNG COWS, BULLS AND HEIFERS
G. B. Reeves, Mountain View, Cal.

Your chance for getting extras is certain when advertised goods are bought.

half brother to Sir Ormsby Skylark, the sire of Duchess Skylark Ormsby, the world's record butter producer, who made 2761.7 pounds milk and 1506.36 pounds butter in one year, her best seven days being 34.35 pounds butter. McCloud Prince Ormsby is out of Minita Inka, a 20.04-pound daughter of the 24.02-pound cow, Minita's Milk Maid.

Then there are in the herd eight daughters of Wisconsin Bess Chief Jr., whose sire is Wisconsin Bess Chief, sire of Spring Brook Bess Burke, 34.80 pounds butter in seven days, and she is the dam of four A. R. O. daughters, two of them above 21 pounds butter in seven days as junior two-year-olds. Of the other two, one is Bess Pietertje Ormsby Mercedes, 21,245 pounds milk and 889.9 pounds butter in one year as a junior three-year-old, and 787.3 pounds milk and 33.22 pounds butter in seven days as a five-year-old. The other is Spring Brook Bess Burke 2nd, with an official record of 792.3 pounds milk and 38.22 pounds butter in seven days. This is transmitting blood of the first rank. On the dam's side Wisconsin Bess Chief Jr. is no less notably bred. His dam is Jennie Ormsby De Kol, 22.94 pounds butter in seven days, record made at nine years of age. She is sired by Duchess Ormsby Piebe Burke, 33 A. R. O., daughters including Sadie Vale Concordia 4th, 41.06 pounds butter in seven days, and she is the dam of King Korndyke Sadie Vale, the only bull in the world to have three two-year-old daughters with seven-day butter records above 26 pounds, one of which made 31 pounds butter in seven days as a three-year-old.

In the herd are three daughters of Fobes Tritomia Homestead, whose sire is Homestead Jr. De Kol, 70 A. R. O., daughters including Grace Fayne 2nd's Homestead, 35.55 pounds butter in seven days. He is thus half brother to Bessie Piebe Homestead, dam of Jessie Fobes Bessie Homestead, 34.95 pounds butter in seven days, and the only cow to have three consecutive records above 33 pounds. She topped the great Detroit sale last summer when she sold at public auction for $3600.

There are also three daughters of Fobes Tritomia Homestead 2nd, whose sire is Fobes Tritomia Homestead and whose dam is Wonder Piebe Homestead, a daughter of Homestead Jr. De Kol.

These young females make a foundation upon which any breeder of black and whites might find delight in building, and while their dams are not all A. R. O. cows yet, it is likely that they will all be tested out as they freshen.

Heading these females is Sir Pietertje Ormsby Canary, a young sire of pleasing type and carrying an extraordinary middle. He is sired by Sir Pietertje Ormsby Mercedes, the great sire whose get have been for several years the sensation of the big shows in the East, and who have made production records fully as notable as their show ring winnings. One of them, Queen Piebe Mercedes, recently became the world's record junior four-year-old yearly producer when she finished a year's test with 30,230.2 pounds milk and 1389.45 pounds butter. Queen Ormsby Pietertje, another of his daughters, recently finished a year's test as a senior three-year-old with records of 21,302.1 pounds milk and 993.2 pounds butter. Several more of his daughters are making great yearly records at the present time, and these will add new laurels to his list of over 50 A. R. O. daughters, many of which already have excellent yearly records. This sire shows transmitting ability of a rare order, his dam being Pietertje Maid Ormsby, 35.56 pounds butter in seven days.

The dam of Sir Pietertje Ormsby Canary is Buffalo Lizzie, 19.32 pounds butter in seven days, and 17,610.4 pounds milk and 862.88 pounds butter in one year as a three-year-old. Her dam, Spotted Lizzie 3rd, is also a producer of note. She has records of 25.19 pounds butter in seven days, and 24,347.9 pounds milk and 1009.87 pounds butter in one year. She also has a sister, Pauline Queen Johanna, with records of 25,660.1 pounds milk and 1024.65 pounds butter in one year.

To develop the splendid blood now in the herd, conditions are gradually being adjusted. The McCloud River Lumber Company is one of the very largest lumber producers in the West, and the presence of a herd of 130 head of registered Holsteins does not make much of an impression when lined up alongside the main operations of the company. But there is a town of something like 2500 population that looks to the company for a supply of good milk, butter and ice cream, and the registered Holsteins are performing nobly to meet the demand. The rich, logged-off lands along Squaw Creek raise abundant crops of alfalfa, and experiments are being carried on each season to determine the best crops that can be grown to supplement alfalfa. Within a comparatively short time many of the feeding problems will have been solved, and then look out for more big records up Shasta way.

While McCloud is somewhat isolated from the principal dairy centers of the state the company has enjoyed a splendid demand for bulls. They have gone to points all over California, from the Oregon line to Imperial County. In fact the writer went in to McCloud on the train with an Imperial Valley dairyman who had purchased several bulls from the company, and who made a good, round offer for the two-year-old heifer, McCloud De Kol Parthenea, but could not seem to interest the company in the idea of parting with her.

WONDERFUL BUTTER MAKER

Regarding the wonderful performance of Winnie Korndyke Cornucopia De Kol Mr. Gibson gives more information as to her monthly record:

Winnie was bred July 6, 1916 to Prince Alcartra Korndyke and at the completion of her year had been carrying a calf over five and one half months, thus making the record all the more remarkable and equaled by no other cow.

Her records are as follows: December, 7 days, 498.7 pounds milk, 14.811 pounds fat; January, 31 days, 3113.5 pounds milk, 92.471 pounds fat; February, 29 days, 3152.4 pounds milk, 91.420 pounds fat; March, 31 days, 3128.2 pounds milk, 95.097 pounds fat; April, 30 days, 2898.4 pounds milk, 87.822 pounds fat; May, 31 days, 2972.6 pounds milk, 81.449 pounds fat; June, 30 days, 2497.5 pounds milk, 71.928 pounds fat; July, 31 days, 2573.3 pounds milk, 81.831 pounds fat; August, 31 days, 2488.9 pounds milk, 77.405 pounds fat; September, 30 days, 2314.8 pounds milk, 74.764 pounds fat; October, 31 days, 2338.2 pounds milk, 75.524 pounds fat; November, 30 days, 1939.1 pounds milk, 72.910 pounds fat; December, 23 days, 1118.6 pounds milk, 43.353 pounds fat. Total 365 days. 31,034.2 pounds milk, 960.789 pounds fat or 1200.99 of 80 per cent butter.

Seven days (40 days after calving). 789.0 pounds milk, 28.73 of 80 per cent butter; 30 days (40 days after calving), 3215.4 pounds milk, 117.2 pounds of 80 per cent butter; seven days (274 days after calving), 558.4 pounds milk 22.58 of 80 per cent butter; 305 days—ten months' record, 27,443.3 pounds milk, 1034.1 pounds of 80 per cent butter.

Raise Your Calves on
Blatchford's Calf Meal
and Sell the Milk

More calves have been raised on Blatchford's Calf Meal than on all other milk substitutes combined.

100 lbs. makes 100 gallons of milk substitute, costing only one-third as much as milk.

Prevents scouring and insures the early maturity of sleek, handsome calves.

It is steam-cooked and no trouble to prepare or use.

Write for Pamphlet "How to Raise Calves Cheaply and Successfully with Little or No Milk." At dealers, or Blatchford Calf Meal Factory, Dept. 8 Waukegan, Ill.

Boys and Girls! Fathers and Mothers!

WE GIVE AWAY SHETLAND PONIES TO BOYS AND GIRLS!

Send Us Your Name Today

Just the Prize Every Boy and Girl Wants

Chas. Teague, Hanford, Cal.
And his prize outfit from the California Cultivator.

Do You Want a Shetland Pony?

Send in your names, boys and girls, California Cultivator, the big California weekly, is going to give away more Shetland ponies and you might just as well have one as anybody. It costs you no money to enter or take part. You can get one of these fine young gentle ponies, the same as many others have, for doing a little work for us that you can do during your spare time. Many other boys and girls say it is easy, and I believe you will say it is, too.

You Couldn't Own a Nicer Playmate

A Shetland pony is the nicest pet and playmate any child can have. They are fine to ride and drive to school, for they are perfectly gentle for a child to ride and drive, and what fun you can have! Many boys and girls who have to walk to school have sent to me for a Shetland pony. These ponies we give away are children's ponies and are gentle and kind and well broken and safe for any boy or girl to handle who is old enough to go to school.

In the past three years the Pony Man has given away 142 Shetland ponies and he had never heard of any of the boys and girls who got them until they sent him their names and addresses so he could write and tell them what to do. Three more fine Shetland ponies and outfits will be given away Saturday, March 24, 1917, to boys and girls who do some work for us that will be easy to do. The sooner you send your name the sooner you can get started.

A PRIZE FOR EVERY BOY AND GIRL

And here is another important point. If you send us your name and address at once you will be entitled to take part in the Extra Prize Awards and you can sure earn a fine camera and gold watch or other valuable prize. You cannot lose, everyone taking part will receive a prize or cash for the work done.

"Sparkle," a beautiful young Shetland and pretty outfit consisting of a fine four-wheeled pony runabout and nickel mounted leather pony harness is the first prize, and that is the one you want and you might just as well have "Sparkle" as anybody. Send us your name and address right away so you can get started at once and get a pony for yourself. Besides "Sparkle" we are going to give away two other fine Shetlands, "Ranger" and "Lightfoot", and a pretty saddle outfit with each one. As soon as we hear from you we will send you pictures of other boys and girls and the ponies they got and tell you how to go ahead. If you already have a pony and know some other boy and girl who would like to have one, please tell them about these ponies we are going to give away.

DELIGHTED WITH THEIR PONIES

I have already given away 142 Shetland ponies and pony rigs to boys and girls and if you haven't a pony now is your time to get one. You will be just as well pleased as the others. I have not the space here to print all the nice letters the boys and girls have written me, but I will send many more when I hear from you. Some have been offered $200 for their ponies and outfits, and would not accept it, so you see these are valuable prizes we give away.

Every Pony Is Safe for Children to Ride

MUCH PLEASED WITH HIS PONY

Hemet, Cal., Dec. 6, 1916.

Dear Friend:

I am writing to tell you that I am very much pleased with my pony. He is the best pet I have ever had. He is gentle and friendly with every one. I named him "Teddy" because I thought the man at the livery stable was joking. I named his middle name "Woodrow".

I am sending you a picture of me on the pony. I like my camera fine.

Your friend,
Raymond Moyer.

Hanford, Cal., Dec. 30, 1916.

Dear Pony Man:

I received "Mary" the day before Christmas, and brother Arnold and I went with Grandpa to get her. I was so pleased to get her and the outfit. Many thanks, and I would advise all little boys and girls that want a pony to enter as I did. I want to thank the many friends that helped me to get my pony. I wouldn't take a good deal for my outfit.

Brother and I had our picture taken and will send it to you. Brother Arnold is five years old, and I am seven. I must thank you again.

Charles Edwin Teague.

Downey, Cal., Dec. 29, 1916.

Dear Pony Man:

Words fail me when I try to thank you for the beautiful little bay and white Shetland pony which you sent me with saddle, blanket, and bridle. He is as clever as he is beautiful, and I know there was no boy more happy than I was when my pony came to me.

You have been only too good to me for the amount of subscribers I sent in. Thanking you again for my pony and your kindness to me, also wishing you a very happy and most prosperous New Year, I am

Sincerely,
Leslie B. Riggins.

Ventura, Cal., Oct. 27, 1916.

Dear Pony Man:

I want to thank you very much for the fine pony "Trixy" which you sent to me. We all think a great deal of her. She is as gentle as can be, and she lets me on her back without either saddle or bridle. We were very much surprised to see such a fine buggy and harness—surely it was far above our expectations. It is certainly fine and dandy and of course with little "Trixy" it is surely a pretty little outfit. We are well pleased with it.

Thanking you again for my dear pony, I am ever

A friend,
Beulah De Witt,
Ventura, Cal.

Extracting Clean

Written for California Cultivator By M. H. Mendleson

DOES it pay to extract close at the end of honey flow? Many believe in extracting supers clean, expecting the brood chamber to contain sufficient stores to winter the bees, others extract also part of the brood chamber, thinking 15 to 20 pounds of honey will last until the new honey flow commences.

I have tried various methods on various locations, near and far from the coast, from an elevation of 50 feet to over 2000, and the amount of honey consumed throughout the winter varied considerably. Forty-five years of experimenting have proven to me that colonies left rich in stores, from at least 35 to 75 pounds or more of honey, will go through the winter in good condition and ready for a honey flow, while those with limited stores will come out weak and poor, and many have to be fed and stimulated, and others too weak to feed. The rich colonies have a surplus of honey in spring, combined with increase of the working force, which much more than pays in the increased amount of surplus gathered, aside from the stores carried over.

The loss of colonies through the winter from queenlessness would run from two per cent to three per cent but when an apiary is entirely and carefully requeened, the loss is exceedingly small.

Should there be a cool late spring (as we have had in former years) the surplus honey carried over increases the working force much more, while the poor weak colony is almost at a standstill. Another advantage of a rich colony over a poor one is that the full combs of honey leave that much less cool air space for the bees to keep warm. It has been proven time and again that a poor colony has to exert itself much more to generate sufficient heat than a rich, strong colony, the latter having a quiet hum, the former having a disquieting hum, excepting too weak and chilled to make any.

There is another point in favor of rich colonies and that is in seasons of dearth the surplus stores will carry colonies over with less expense of feeding. One season in particular, when we had a dry winter I removed in the spring all supers, stored them away and fumigated them and in June I returned them to these colonies and carried them through the winter without having to feed. With capped combs of honey there is much less honey consumed than when feeding in liquid form as feeding in the liquid stimulates them to consume much more by starting brood rearing and also in the exertion of storing and capping.

Contracting entrances to one, two and three inches will add to better wintering by economy of heat as but little draft is necessary for fresh air. Entrances should be mouse proof to prevent destruction of combs and honey. A 1-16 inch entrance will prevent a mouse from entering.

I carry over several hundred three L framed nuclei with young queens in three compartment hives, near the coast, and it costs nearly as much in stores to winter them as it does full colonies. The center compartment being stronger, caused by the heat from the side colonies, a cushioned cover filled with chaff would winter them with less stores and in better condition, as the chaff would absorb the moisture that collects and cools the top, and at the same time the chaff would confine the heat and consequently the colonies would come out much stronger in spring. This I have tested. It has an effect similar to packing colonies in the Eastern cold climates. Moisture on top of colonies or combs causes unhealthy conditions. It molds combs, causes a cool, damp atmosphere within. When this dampness is taken up by an absorbent, the colony comes out in a much more satisfactory condition.

Bees will cluster close up to a packing of this kind with comfort. Spring dwindling is not bad with a comfortably packed colony. Even if we are in a mild climate I hope to try it extensively another fall.

Fumigated section honey is not as natural or as good as that not fumigated. The odor is more or less affected by sulphur fumes.

TIME TO LOOK HIM OVER

"The suggestion comes to us that farmers contemplating buying a tractor for next season's plowing and other work should get the iron critter early enough to have an opportunity to get acquainted with his likes and dislikes, eccentrics and eccentricities, before the heavy pull ahead of the plows comes. Buying a tractor and putting it immediately to plowing without previous experience is courting failure, the record shows. The advice sounds sensible. A farm tractor is a piece of machinery that will keep on running right if handled right, but that won't run smoothly if handled foolishly. No farmer new to automobiles would think of buying one and starting in it the same day to visit his wife's relatives in New England. He would run it around the square and to town a few times first. Same with the tractor. Plowing a 40 or a 60-acre field is a long ride, best made on a tractor previously handled to some extent by its driver."

PEAR GROWERS

THREE YEARS SINCE
we first preached a new gospel to the pear men of California—the gospel of the BLIGHT-RESISTANT ROOT.

THIS WAS THE FIRST NURSERY
in the United States and the only one in California to declare that the old, blight-susceptible French root MUST GO.

SINCE THAT TIME
Scientific experiments have furnished ABSOLUTE PROOF of the great superiority of the Chinese or Japanese seedlings as a root for the pear. To-day, all well-informed Western nurserymen are coming to the position then taken by ourselves, and the blight-resistant root is a FIRMLY-ESTABLISHED IMPROVEMENT in Pacific Coast nursery practice.

WE WERE NOT
the first nursery in the state to use the blight-resistant root, but we were first to make its great advantages known to orchardists from San Diego to Del Norte, and our propaganda has compelled the nursery trade generally to furnish the California pear man THE BEST ROOT that is available to the horticultural world today.

NEW WINTER PEAR
For years we have specialized in pears. This year we introduce the NEW WINTER PEAR, A. J. COOK, believed by some of the leading shipping authorities to have excellent qualities for the Eastern market.

AT YOUR SERVICE
Every fact we know about pears is yours if you ask for it—whether customer or not. If we can help you, give us that pleasure.

NOW BOOKING ORDERS

Letters to a Beginner

Written for California Cultivator By Jean A. Koethen

THE INCUBATOR

DEAR GEORGE: Incubator hatching depends on three factors, the eggs, the machine and the operator, and the three are interdependent. Your eggs must be fresh. Every day they are kept after the animal heat has cooled weakens the germ and diminishes its chances of hatching into a strong chick. Two weeks is the limit.

In selecting an incubator you will have to be guided by the poultrymen in your own neighborhood, for a machine may do excellent work in one locality and be a failure in another. I remember talking with a woman who was running two large hot water machines in her home in an interior valley not far from Los Angeles and having the best of success with them. She said that while living in a beach town she had used a hot-air machine, but when she moved away from the coast she had to give it up. The moisture problem is the most perplexing of all incubator problems. Whatever machine you use, in dry weather or a dry climate, you will probably have to add moisture in some form, whether the machine provides for it or not, but the experience of those who have studied a given climate is your best guide. The machine they use and their practice in using additional moisture will be safest for you.

The best motto for a novice who is beginning to handle incubators is. "Let him that thinketh he standeth take heed lest he fall." The incubator is a wonderful invention and largely responsible, no doubt, for the rapid rise of the poultry industry the last 20 years, but no make is perfect. Neither is the hen when it comes to that. An incubator has even less intelligence than a hen and it lacks her maternal instinct. You have to supply both, and more. Running an incubator isn't a matter merely of intelligence but of absolute fidelity in attention to a large number of apparently unimportant details; such a trivial matter as testing your thermometer before the hatch begins, for instance. You say, "Oh, well, it's about right; I won't bother", but that won't do. You have to bother. If your thermometer registers half a degree higher than it ought, and the center of the bulb is a quarter of an inch above the top of the eggs, what should it register when the directions in your book say "Run at 103 degrees when the center of the thermometer bulb is on a level with the top of the eggs". It's a case of mathematical exactness or a spoiled hatch. Then that little matter of levelling the machine. Every direction book says: "Be sure that your incubator stands perfectly level." If you are careless about this you will find, if you investigate, that the air at the upper end of the egg chamber is warmer than it should be, and that at the lower end cooler. As for turning and cooling the eggs there is a chance for infinite care. In this you are imitating the mother hen who keeps moving her eggs from one side of the nest to the other and wiggling them around with her toes. She doesn't know that she is wiggling them to keep the germ from sticking to the shell nor that they must be shifted from the center to the edge of the nest and back again so that each has its chance at the warmest place, which is right under her breast. When she leaves them for half an hour while she rolls in the dust and chases a bug or so, she doesn't know she is giving each growing germ a little cooling. It doesn't matter whether she knows it or not. We know it and we must follow her lead as nearly as maybe.

Your lamp must be cleaned and filled every day and at the same hour. That is a good deal of trouble. I wonder how many incubator operators there are who have never neglected this direction and then suffered the humiliation of finding the light out and the eggs chilled. We learn through bitter experience always, and it is strangely hard to profit by that of others, even when it is before us in black and white.

I have not time to give you full directions for running your incubator. You will receive a direction book with your machine, and your first duty is to follow it explicitly. The manufacturer knows his machine better than you do. When you have learned to follow his directions understandingly you will probably find that you can improve upon them, for every incubator has some fault, but follow directions and learn your machine before you experiment. Circular 99 of the college of agriculture of the University of California will be a great help to you in studying artificial incubation. You have only to send a postal card and you will receive it free of charge. The following brief rules may be a help to you in formulating the information you gather from various sources:

Run the incubator in a cellar, if possible, to secure uniform temperature, which should be about 60 degrees.

Provide abundant ventilation, but avoid drafts. This may be done by removing windows and inserting in their place frames covered with muslin.

Before each hatch, wash and disinfect the incubator.

Start the machine two days before you wish to put in the eggs and keep it running steadily at 102 degrees for 24 hours.

After the eggs are in, keep it running at 102 degrees the first week, then raise temperature gradually to 103 degrees.

Do not open the door of the egg chamber for 48 hours after the eggs are put in. After this turn morning and night until the 19th day. Do not disturb after they begin to pip.

Begin cooling the seventh day and cool every evening when the eggs are turned, gradually lengthening the cooling period to 40 minutes or more. Cool till the small ends of the eggs feel warm when placed against your eye.

Test out infertile eggs and dead germs on the seventh and 14th days.

Begin each new hatch with a new lamp wick and perfectly clean lamp. Fill lamp and clean wick after the eggs are turned each night.

Provide moisture, when it is needed, by keeping the floor wet.

Be sure the machine is level and the thermometer correct.

Here's hoping you will be as successful in learning to use the incubator as you were with your hen hatching.

Affectionately,

Aunt Jenny

Mammoth Bronze Turkeys

Written for California Cultivator By Geo. A. Smith

MAMMOTH Bronze turkeys are by far the most popular in the world today. They have beautiful brilliant plumage, grow large, are strong and vigorous, good foragers and well adapted to our climatic conditions. They mature in time for the holiday season, are easily fattened, have a yellow skin, and their large frames carry a considerable amount of fine grain meat, which makes them for market purposes without an equal When purebred Mammoth Bronze turkeys are crossed with the grade or common stock usually found on the farm they increase the size and hardiness of the young turks, making them easier to raise and when matured you have a bird that has the size and quality of meat that commands a higher price in the market than ordinary common stock.

It costs almost nothing to raise turkeys, for if allowed their freedom during the day, as is most consistent with their nature, they gain most of their livelihood themselves and will destroy multitudes of injurious insects. Skim milk, which is to be had on almost every farm, is an excellent food for both young and old turkeys, either made into a curd or given to them fresh. Such easy feeding requirements makes turkeys one of the best friends of the farmer, doing him the greatest kindness and bringing him the greatest net profit for the amount invested.

The cry that "turkeys are hard to raise" keeps quite a few people from starting in the turkey business. You should give them curd for the first six weeks, being careful not to feed the young turks too much at one time, for the natural habit of the turkey is to hunt for its food, and they do it slowly and deliberately all day long, thus the process of eating and digestion are simultaneous. When they are fed with a lavish hand they gorge themselves and soon fall victims to their greed. Do not allow them to get chilled when young and see that they are free from mites. A few precautions for the first few weeks will give you good results and help to increase your net profits at the end of the season.

You will, I am sure, find that there is no animal on the farm which will return such profits as the turkey when sold at the ordinary prices, and we may look now for prices quite beyond the ordinary, as the prices for this year broke all records.

Good turkeys always find a ready market at remunerative prices, but poor breeding stock will never produce good birds. By always breeding from the most perfect birds and purest strains you can increase the size of the common stock fully 25 per cent. Don't buy inferior birds for your breeding stock, for if you do you will regret it and will lose several times the cost of good stock. Secure well bred toms, as you will find it pays much better to breed only from the best as "like produces like," and the tom is half the flock.

On account of the extra high prices of market turkeys this season there has been the greatest demand for breeding stock I have ever known.

STORRS EGG LAYING CONTEST

The continued cold weather for the past two weeks is having its effect on the hens in the laying contest at Storrs. Some of the birds are holding up finely under the unfavorable weather conditions, but all of the pens taken together were more than 200 eggs under last week's production and about 50 eggs under the production for the corresponding week a year ago, the exact yield for the week being 1720 eggs.

The three best pens in each of the principal varieties are as follows:

Barred Rocks

Jules F. Francais, 213; Fairfields Poultry Farms, 192; Rodman Schaff, 121.

White Wyandottes

Merrythought Farm, 232; Brayman Farm, 195; A. L. Mulloy, 180.

Rhode Island Reds

Pequot Poultry Farm, 204; Jacob E, Jensen, 202; Hillview Poultry Farm, 171.

White Leghorns

Hilltop Poultry Yards. 291; Clifford I. Stoddard, 267; A. P. Robinson, 261.

Miscellaneous

Cloyes & Sullivan (Buff Wyandottes), 223; Koshaw Farms (Buff Rocks), 210; Obed G. Knight (White Orpingtons), 188.

Report for ninth week ending January 2, 1917, Storrs, Connecticut.

The total output in the ninth week of the laying contest at Storrs amounted to 1731 eggs. This is less than the corresponding week a year ago but a little bit better than last week's production. It now seems probable that a steadily increasing yield may be expected each week from this time on until the height of the season.

The three best pens in each of the principal varieties are as follows:

Barred Plymouth Rocks

Jules F. Francais, 251; Fairfields Poultry Farms, 218; Rodman Schaff, 136.

White Wyandottes

Merrythought Farm, 262; Brayman Farm, 213; A. L. Mulloy, 205.

Rhode Island Reds

Jacob E. Jansen, 227; Pequot Poultry Farm, 218; Hillview Poultry Farm, 208.

White Leghorns

Hilltop Poultry Yards, 316; A. P. Robinson, 306; Clifford I. Stoddard, 303.

Miscellaneous

Cloyes & Sullivan (Buff Wyandottes), 257; Koshaw Farms (Buff Rocks), 241; Obed G. Knight (White Orpingtons), 209.

EGG LAYING CONTEST AT MOUNTAIN GROVE

By C. T. Patterson, Director

The 290 hens in the sixth egg laying contest at Mountain Grove, Missouri, produced 2872 eggs during December, which is almost ten eggs each. The highest producing pen for November and December has produced 210 eggs, which would average 252 eggs each if they continue at the same rate throughout the year.

The highest producing individual for the two months produced 54 eggs, which means 324 eggs during the year at the same rate. It is not safe to make this prophecy but it goes to show that if pullets are properly developed it is possible to get a good egg yield during the winter months.

The five highest pens for the month are as follows: R. C. R. I. Whites, New Jersey, 113 eggs; White Wyandottes, New York, 102 eggs; White Wyandottes, Missouri, 102 eggs; White Orpingtons, Missouri, 94 eggs; S. C. Reds, Iowa, 93 eggs; R. C. Reds, Missouri, 92 eggs.

AMERICAN EGG LAYING CONTEST AT LEAVENWORTH, KANSAS

By T. E. Quisenberry

The egg yield for December was much better than the previous month, but 14 pens have not laid an egg. Most of the pens are in good condition, and we look for them to do extra well from now on. White Wyandottes led for December. The Wyandottes, Reds, Rocks and Orpingtons were affected less by the zero weather than the Leghorns and smaller varieties. The highest individual record was 28 eggs by White Wyandotte pullet from West Virginia and one of the same variety from Indiana laid 25, Buff Orpington from Missouri, 25.

The ten highest pens of five pullets for December:

White Wyandottes, Illinois, 94 eggs; Buff Wyandottes, Missouri, 80 eggs; R. C. R. I. Reds, Missouri, 75 eggs; S. C. R. I. Whites, Michigan, 69 eggs; S. C. R. I. Reds, Mississippi, 68 eggs; S. C. Buff Orpingtons, Kansas, 67 eggs; S. C. W. Leghorns, Pennsylvania, 65 eggs; Barred Plymouth Rocks, Missouri, 62 eggs; Barred Plymouth Rocks, Illinois, 62 eggs; S. C. Buff Orpingtons, 57 eggs; S. C R. I. Reds, Missouri, 57 eggs.

Wonderful Egg Producer

Any poultry raiser can easily double his profits by doubling the egg production of his hens. A scientific tonic has been discovered that revitalizes the flock and make hens work all the time. The tonic is called "More Eggs." Give your hens a few cents' worth of "More Eggs" and you will be amazed and delighted with results. A dollar's worth of "More Eggs" will double this year's production of eggs, so if you wish to try this great profit maker, write E. J. Reefer, poultry expert, 4261 Reefer Bldg., Kansas City, Mo., who will send you a season's supply of "More Eggs" Tonic for $1.00 (prepaid). So confident is Mr. Reefer of the results that a million dollar bank guarantees if you are not absolutely satisfied your dollar will be returned on request and the "More Eggs" costs you nothing. Send a dollar today or ask Mr. Reefer for his Free poultry book that tells the experience of a man who has made a fortune out of poultry.—Adv.

Fruit and Nut Trees grafted. Chas. Pfeffer, 39 Clifton Ave., San Jose, Cal.

HOGS

Smith's Poland-Chinas—Sows and gilts bred to Joker, first prize boar at Wisconsin State Fair 1915. These sows and gilts were sired by Iowa Wonder, who is a son of the great A Wonder, the most celebrated Poland-China boar living or dead. Litters from this mating are the best I have ever seen anywhere. Prices low, quality considered. Will sell one or a carload. As a special inducement each purchaser will be given a year's subscription to the American Swineherd, the best swine paper published, and a copy of the Handbook on the Sow, also a copy of the Pig Feeders' Manual. Geo. A. Smith, Corcoran, Cal.

Grape-Wild Farm Berkshires — World's Fair Grand Champion Grand Leader 2nd heads our herd, not only himself a champion but the sire of champions. At the 1916 California state fair his daughters won all of the senior sow classes including the grand champion sow. At the 1916 Oregon state fair a Grand Leader sow was junior champion. We are offering a number of choice boars of exceptional breeding and are also booking orders for fall pigs. A. B. Humphrey, Escalon, San Joaquin Co., Cal.

Make Big Money with our Big Type Poland-Chinas. Smooth, easy feeders that make greatest weight in shortest time at lowest cost, topping the market at 225 lbs. in 6 months 300 head, both sexes, all ages, reasonable prices. Best Eastern blood lines. Satisfaction guaranteed. Ranch in Tulare County, but address owner, R. H. Whitten, 610 B. Security Building, Los Angeles.

Billiken Herd of Chester Whites—The big prize winners at the 1916 California state fair. The breed that makes money for the rancher and dairyman. Have 4 nice young service boars left and 20 young open gilts that will be bred as desired by buyer. Write for the Chester White booklet that tells all about them. C. B. Cunningham, Mills, Cal.

Poland-Chinas—Twenty good gilts and three 2-year-old sows for sale. Either sired by or bred to I. B. A. Wonder, reserve champion at P.P.I.E. A few good young boars ready for service, sired by I. B. A. Wonder. A fine lot of fall pigs. I please you or refund your money. W. A. Young, Lodi, Cal.

Large Yorkshires—Choice spring boars, gilts and weaned pigs from champion sow P.P.I.E. or from breeding of champion boar and sow Sacramento, 1916. If you see them grow you will like them. Riverina Farms, Paradise Road, Modesto, Cal.

Superba World's Grand Champion Poland-China boar and one of the greatest sires of the breed. Spring boars ready for service, also few sows bred to this noted sire, reasonably cheap. Rough's Greenfields, Arlington Sta., Riverside, Cal.

50 Bred Sows and Gilts, 50—Of true Berkshire type and quality; bred to grand champion boars are included in our private sale list now ready for mailing. Write for it today. Silver Birch Farms, Box C. C., Newport, Wash.

For Exchange or Sale—Registered Berkshire boar, not quite two years old. Fine type and splendid breeder. Will exchange for Berkshire boar of equal merits. Want new blood. W. M. Chambers, Miraflores Ranch, Anaheim.

Registered Poland-Chinas, prolific, fabulous, profitable, porkers. Choice young boars now ready for service, $25 each, weanlings $15 each. Dr. J. A. Crawshaw, Hanford, Cal.

Thirty Medium Big Type Poland-China boars for sale. Shipped on approval. We will send a good one for $30 and a crackajack one for $50. Bernstein Ranch, L. C. Trewhitt, manager, Hanford, Cal.

Rancho Rubius Durocs all sold except a few extra good July and September gilts. Write for prices. Elmer Lamb, Ceres, Cal.

Choice Boar Pigs for sale. Sired by Superba 220620 champion Poland boar at San Francisco. Prices right. C. R Hanna, Riverside, Cal

Large Yorkshires—The ideal hog for the progressive farmer. Service boars and fall pigs, both sexes, for sale. A. L. Tubbs Co., Calistoga, Cal.

COMMERCIAL HELPS AND HINTS

If you buy harness of the Hercules brand you will be satisfied. It is made right and will give excellent service.

Mr. Z. A. Macabee of Los Gatos makes a particularly good gopher trap. You can get it of your dealers or from him direct.

Have you seen the De Laval line of dairy equipment? Their catalogue shows it. Everything from milk bottles to Alpha Engines.

Get your sprayer now. Write to the Bean Spray Pump Company, San Jose, or to Theodore Poindexter, 338 Brannon Street, San Francisco. Catalogues free on request.

If you have crop troubles it would be a good plan to write to the Pacific Guano and Fertilizer Company, San Francisco, for special information and free booklets concerning your particular case.

Don't forget to oil your harness. Eureka Harness Oil will prolong the life of your harness and make it more pliable and easier handled.

Have you ever tried Ghirardelli's Ground Chocolate? It is a delightfully refreshing hot drink and leaves no bad after effects.

Legal Queries

Louis B. Stanton, attorney, 243 Wilcox Building, Los Angeles, will answer legal queries in this department.

Immediate mail replies cannot be given except where fee to Mr. Stanton is paid. When replies are wished in Cultivator address query to 115½ N. Broadway, Los Angeles.

Unsigned communications receive no attention.

Trees on Line

How near to the property line may I plant trees?—Subscriber, Los Angeles.

You are entitled to plant trees up to the line of your land. Due regard should be had, however, that the trunk of the tree is at least wholly upon your own land as in case it is upon the boundary line the tree becomes the common property of both.

Joint Deed

Does the surviving party to a deed written "either or survivor" continue possession of the property without any court procedure?—Subscriber.

The surviving party may continue in possession of the property without court procedure, but in order to vest salable title it is necessary to file a petition setting forth the death, whereupon the court makes its judgment, which judgment, on being recorded in the office of the county recorder completes the chain of title and enables the survivor to execute a good and sufficient deed. In such instance there need not be any general administration of the estate of the deceased as the property is not in any sense a part of said estate, nor would it be liable for the debts of the decedent.

Look for the waste places on the farm. Some of these may be on fields that wash; some on the overflowed fields; some the poorly drained places. The barnyard manure may be wasting, the implements being left out in the weather to deteriorate. The waste may be in trying to do with the hands what should be done with implements and machines. Look for wasted energy and wasted opportunity.

VALUABLE TRACTOR ATTACHMENT

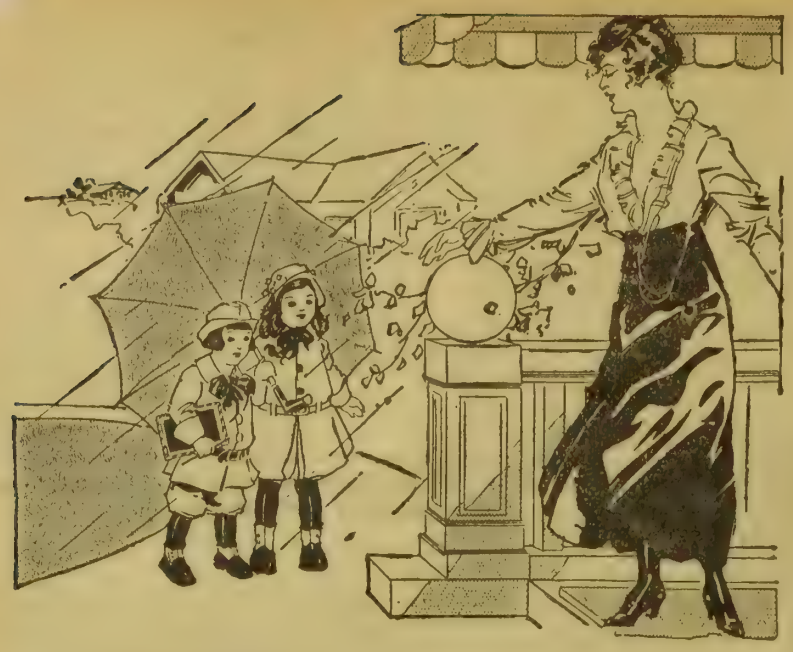
Of all the "universal tools" the Ford is probably proving the greatest winner. It will take the family to town, grind the grain, churn the butter, and furnish almost every other conceivable form of power. It has also been used to do the cultivating of the orchard but until now has not proved entirely satisfactory. Now comes an attachment for Ford cars which is so successful that first purchasers are coming back with the "I-want-another" look on their faces. Furthermore, some have already purchased their second attachment. Fortunately, this attachment is of California construction. The manufacturer says that for hauling heavy loads to market there is an attachment for slipping over the rear wheels, giving a wide smooth tread, permitting use on improved roadways. It takes about 20 minutes to make the attachment. One grower says that with this attachment he can do the work of six horses on his ranch. This is merely to call attention to the value of this improvement. More particulars may be seen in the advertisement of the Los Angeles Auto Tractor Company, Los Angeles, appearing in this issue.

Overhead expense, which few farmers consider, perhaps, but which should be taken into account by all, will dictate that as small investment as possible consistent with sufficient equipment should be the rule. To invest in a tractor is beyond possibilities of many small farmers. Here is where the new attachment will prove a winner. Look up the Ford Tractor Attachment.

New blood has recently been introduced into the company manufacturing this appliance, and it has resulted in preparations for manufacturing on a large scale. Only this week arrangements were made for the sending of 500 of these tractor attachments to Messrs. Sims and Darr of Portland. This one order involves $75,000. The inventors of this appliance are Messrs. James R. Fouch and Harry R. Fouch. The officers of the company, as recently organized, are Harlan W. Brush, president; G. R. Fouch, vice president; Walter S. Brush, treasurer; Charles Rhodes, manager, and Harry Fouch, superintendent.

PRIZE TREE

The Silva-Bergtholdt Company of Newcastle are mailing their new catalog of "Prize Trees of California Fruits". Mission olives on Picholine root, prunes on Myrobolan, cherries on Mazzard and Tuscan cling on natural peach seedlings are leaders with this firm. Much could be said regarding the worth of this catalog but those interested in deciduous fruits can learn more regarding it by writing at once to the nursery for a copy.



"Hurry, children—I've got a real treat for you."

Ghirardelli's Ground Chocolate

is a fortifying food beverage for all—from childhood to old age.

It comes **PROTECTED**—as all chocolate should—in ½-lb., 1-lb., and 3-lb. hermetically sealed cans.

LIFE

Two men toiled side by side from sun to sun,
And both were poor;
Both sat with children, when the day was done,
About the door.

One saw the beautiful crimson cloud
And shining moon;
The other, with his head in sadness bowed,
Made night of noon.

One loved each tree and flower and singing bird
On mount or plain;
No music in the soul of one was stirred
By leaf or rain.

One saw the good in every fellowman
And hoped the best;
The other marveled at His Master's plan
And doubt confessed.

One, having heaven above and heaven below,
Was satisfied.
The other, discontented, lived in woe,
And hopeless died.

—Selected.

THE VENDETTA

By Arthur Wilkes Colton in the Youth's Companion.

IT was in October that Moses Durfey's dog, Ulysses, and Willy Flint's terrier, Samuel J. Tilden, came from opposite directions through the tall ferns, and so into the opening on top of the hill that we called Pisgah, just as the red fox came from the cattle ridge, slipping over the ground like the shadow of a cloud on the grass. Ulysses and Tilden made for him with all the tumult posible to them, and he slipped like a shadow into his hole. Then the disappointed dogs fell foul of one another, bit where they could find a bite, and filled the top of Pisgah with excitement. Thus the trouble began, and in election time, too.

The next afternoon men built a platform in front of the town house, with planks across the steps and soap boxes under the planks, so that it was very shaky. The platform was for the speaker, who was expected to tell us exactly what we should do. There were benches on the platform for prominent citizens to sit on, in order to show that they were prominent and upright, and agreed with the speaker.

In due time the citizens sat on the platform in a row, the speaker in the middle. There were Mr. Atherton Bell, the minister, Deacon Crockett, and the rest, including Ulysses, who lay under Mr. Durfey's bench, quite unaware that Tilden was not far away on the same platform. Then Mr. Atherton Bell made a speech to introduce things.

"I count myself happy," he said, after a while, "that I stand today in this fair sunlight, under this blue arch of American freedom, to introduce to the steadfast upholders of that freedom the honorable gentleman and distinguished orator, the Senator from—"

Now the Senator was a short, stout, kindly-looking man. The top of his head was very bumpy. You could tell he was a great man from the way he said: "Fellow citizens." And presently he got into an excited state of oratory.

"Our platform is firm as truth. It may not be moved." He meant the party platform, not the one of the town house steps, which was shaky. Every one applauded. Ulysses got up, and said "Wow!" S. J. Tilden said, "Woof!" and bristled up. "My faith is pledged to this—"

"Hurrah!" "Wow!" "Woof!" S. J. Tilden was making for Ulysses. He had scrambled to the platform. They met in the midle. Snip! Snap! Rrrr!

"These are my principles. No power on earth can move my feet from where they stand—"

Bump! The dogs went against the back of the distinguished legs of the Senator from——, and he came down into an undistinguished bipartizan mix-up with S. J. Tilden and Ulysses, as if he had no principles at all.

The prominent citizens rose in a body. The audience tried to help. One of the right-hand soap boxes fell over and dropped a plank. Mr. Atherton Bell, Deacon Crockett, S. J. Tilden, Ulysses and the distinguished Senator slid down it together without distinction.

After the plank was set up again, and Tilden and Ulysses were carried away by a committee, the Senator mounted the platform gingerly.

"Gentlemen," he said, "if dogs are going into politics, I'm going out."

"Hurrah!"

"There must be a limit to the franchise." And all upholders of freedom agreed with him.

On the day following, "Chub" Leroy said he believed this thing between Ulysses and Tilden to be a vendetta, and Moses Durfey asked what was a vendetta?

"It's a row," said Chub, "that goes on forever, and you rope in all your relations."

"Oh! Angelica will like that." Angelica was one of the owners of Tilden. Probably she would like it. She was a girl of the kind that when there is a row and she does not immediately get into the middle of it, becomes unhappy.

It seemed probable that Angelica, as well as Willy Flint, her brother, the other owner of Tilden, would see how necessary it was, in order to establish the vendetta, that we should act in some violent manner toward each other. But none of the three backers of Ulysses fancied himself in the position of punching Angelica's eye. And it seemed probable that if a single combat were proposed between Willy Flint and one of the three, Angelica would club the heads of the other two as well. You had to walk very carefully with Angelica.

Now a vendetta, acording to rules, can only be called off by the principals; that is, as long as the first couple keep it up, the relatives have to stay in. It was set down in the minister's "Political and Social History of Corsica" that the principals were generally killed off to begin with, and the relations stayed in as long as there were any of them left who had energy.

We thought we would go and see Mr. Atherton Bell. He was a lawyer, and besides, he never took our ideas frivolously, as elderly people were apt to do. We went down the hill from the Cross Roads, leading Ulysses by a string, and found Mr. Bell on the steps of the postoffice, together with Harvey Cummings and Mr. Paulus, the postmaster.

"Oh! Ah! Yes!" said Mr. Bell. "A vendetta, a feud. Dear me! Do you think Ulysses is serious?"

Moses was doubtful about Ulysses. Ulysses was seldom serious. But S. J. Tilden was serious. He was never anything else.

"Ha! But the presence and character of Angelica are embarrassing. She insists on her rights."

"Yes, sir."

The Cultivator Patterns

8043—Children's Dress. Cut in sizes 4, 6, 8 and 10 years. The dress is cut in one-piece from the shoulder to the lower edge.

8044—Ladies' Middy Blouse. Cut in sizes 36, 38 and 40 inches bust measure. The blouse slips on over the head and is made with yokes.

8052—Ladies' Waist. Cut in sizes 36 to 42 inches bust measure. This waist may be made with or without the deep cape.

8029—Ladies' Dress. Cut in sizes 36 to 42 inches bust measure. The dress is cut in one piece and has a yoke at the back.

8015—Maternity Gown. Cut in sizes 34 to 44 inches bust measure. Side of body and sleeve are in one piece and the skirt is cut in one piece.

8047—Ladies' Skirt. Cut in sizes 24 to 30 inches waist measure. The skirt is cut in four gores and is plaited at the sides and joined to yokes.

8032—Girls' Dress. Cut in sizes 6 to 12 years. The dress closes at the front and has a three-gored gathered skirt.

PRICE OF ANY OF THE ABOVE PATTERNS 10 CENTS EACH.

HOW TO ORDER PATTERNS

Write your name and address plainly in full, give correct number and size of each pattern you want, and send ten cents in coin or (1 or 2c) stamps for each number. In order to furnish our readers with the very latest New York City styles, all pattern orders are filled in New York City. Therefore, we promise to deliver all patterns ordered within two weeks; we guarantee safe delivery of all patterns. Address

California Cultivator

Los Angeles

"Very embarassing. Chivalry, you know. Why, dear me! This is a most interesting, a most extraordinary case!" Mr. Bell took off his hat and walked up and down with increasing excitement.

"What, what! Harvey, you don't mean to say you never heard of such a case before! Never, upon my word! Chivalry, vendettas, political dogs, women's rights, all mixed up! Never, never! Where's the other dog? Bring the other dog! Gracious! Will no one bring the other dog? Paulus, those dogs upset the platform, they did. The Senator has a bump on his head to my certain knowledge. What! Paulus, Paulus, they must refrain. Those dogs must be persuaded. They will involve their families in this—a—deadly struggle. They will. I foresee it."

Mr. Bell's eye was shining ,and he nearly got into a state of oratory, as the Senator had done. We children thought it grand when any one got into a state of oratory. It was better than fits.

At about this time Willy and Angelica Flint came up the hill, leading S. J. Tilden, and turned into the post office. Mr. Bell saw them coming. He got out of his state of oratory slowly, and rubbed his hands.

"There now," he said. "There you are."

"Where?" asked Harvey Cummings, indignantly. "You goin' to set dem dogs a-fightin'? I say, 'taint righd."

"Nonsense," said Mr. Bell. "I'm going to persuade them to—a—refrain, for—a—the sake of their families. How? I—I don't know how."

Ulysses and S. J. Tilden were tugging at their strings and growling angrily. Mr. Paulus turned and went slowly into the store. Mr. Bell looked about him helplessly. Mr. Paulus came out with a bottle in his hand. His left eyelid, which drooped naturally, drooped lower in a heavy wink.

"Let 'em go!" he said.

"What, what! Paulus, what's that? What's that?"

Ulysses and S. J. Tilden flew at each other, gripped, rolled and mixed themselves. Mr. Paulus emptied the bottle over them calmly. "Ammonia," he said. "It's good for dog fights."

Ulysses and S. J. Tilden put on expressions that could not be forgotten. They backed off and looked at each other with intense dislike. Then they each gave a mournful howl and went in opposite directions.

They never met in friendship or enmity again. I think it was the opinion of each that the other had played a low trick and knew all about the smell. If you put ammonia on the nose, it smells considerably. Whenever they saw each other, they remembered it, and backed off and went different ways.

HOW TO MAKE FASTENERS STAY ON

A neat, durable way to sew on hooks and eyes, snaps, and patent fasteners is to buttonhole them into place, letting the purl of the buttonhole stitch come to the outside of the ring.

Fasteners put on in this way will outwear any ordinary garment. Once on they are always on.

CHICKENLESS CHICKEN PIE

The hungry man in the restaurant lifted the lid of his chicken pie, called the waiter and protested the absence of any chicken therein.

"It doesn't require chicken to make chicken pie," the obliging servant explained. "Did you ever see any dog in dog biscuit?"

SCOTTICISM

McTavish and Macpherson are adrift at sea in an open boat.

McTavish (on his knees)—O Lord I ken I've broken maist o' they commandments. And I've been a hard drinker all my days. But, O Lord, if we're spared this time, I promise never—"

Macpherson—I widna commit mysel' over far, Donald. I think I see land."—Life.

A COMPROMISE

"Look here, Hiram," said Si, "When be you goin' to pay me them eight dollars for pasturin' your heifer? I've had her now fer about ten weeks."

"Why, Si, ther critter ain't worth more'n ten dollars."

"Well sposin' I keep her fer what you owe me?"

"Not by a jugful. Tell you what I'll do; keep her two weeks more and you can have her."

TIT FOR TAT

Little Boy (to stout old lady who was hauling herself into the street car with difficulty)—If they'd given yer more yeast, missis, when yer was young you'd been able to rise better.

Stout Old Lady—An' if they'd given you more yeast, my boy, you'd a' been better bred.—London Mail.

The truly good wife is a good housekeeper, but her house is a home where everybody can be comfortable and where one's friends are made welcome. She is thrifty, but not parsimonious; religious, but not fanatical; bright, but never sacrificing her family to her intelligence. She is like a bright fire and a cheery lamp on a dark winter evening; a living expression of love, comfort, and hominess. The family wants to be where she is; her absence leaves the house only four walls, the magic of the home removed. She is the supremest gift a man ever receives on earth, for she brings all other good things with her.

To be interested is to be happy, and to be happy is simply to be in accord with your world. A sense of this truth may come to you anywhere, over the wash tub, out in the garden, in the poultry yard, listening to the sleepy chirp of the little chicken under its mother's wing. If we wish to be happy we should find out early in life what we can best do, and cultivate a philosophical way of thinking.

Reward the boys and girls who were so diligent and faithful last year by giving them animals and crops this year. Give them an opportunity to use their own originality in producing for themselves. This need not interfere with their loyalty and help with the general crops. It is quite likely to encourage them and cause them to take greater interest.

Salad dressings of various kinds are improved by the addition of cream. It may be whipped and added to a boiled dressing and making a most rich and tasty dressing. Simply adding sour cream with sugar and salt to sliced cucumbers or cabbage, with a dash of salt and pepper, you have a most appetizing salad ready to eat.

SIGNS OF SPRING

The violets soon will bloom again,
The skies are getting blue,
The milliner will send her bill,
And we shall get so, too.

All things announce the gentle spring:
The grass is growing greener;
Far down the pleasant street doth sing
The sweet-voiced vacuum cleaner.

MIRRORS AND FACES

If you smile into a mirror
Of course therein will be
A clear reflection of your face,
On which a smile you see.

So really are the faces
Of friends and strangers, too,
The mirrors where our smiles are caught
And pictured to our view.

So, too, when we are frowning
Our scowling ever tends
To be reflected back to it
From faces of our friends.

So here's a plan to follow—
A plan that's tried and true;
At other faces smile—and watch
The smiles come back to you!
—Unknown.

If the home is not provided with a certain degree of comfort then there is bound to be unhappiness.

TREATING A WOUND

Tincture of iodine is now considered by surgeons to be the king of antiseptics. A solution of weak tincture of iodine can be poured right into a fresh cut and no harm will come from it. It will smart a little at first, but not for more than a minute. Next a clean soft cloth is saturated with the iodine solution and the wounded member is wrapped up securely. In about two days the cloth is replaced by a clean one, daubed with a little iodine ointment, which may be secured at any drug store. At the end of a week all bandages may be removed and the wound allowed to heal. No pain, no pus and a very slight scar are the usual things when a wound is treated thus.

All wounds on animals should be treated in the same way. Barb wire cuts, sore shoulders, nail wounds and sliver wounds heal up very quickly if thoroughly saturated with a solution of tincture of iodine.

RABIES GERM WAS A HORNET

As Mrs. Ben Hutton was visiting a neighbor, a cry of "mad dog" was heard. A large brindle cur, frothing at the mouth and with all the earmarks of rabies dashed through the yard and crawled under the house, uttering agonized howls.

Demands were made for a gun, but Mrs. Hutton would not let the dog be shot. Believing that something else besides madness ailed the dog, she went under the house after him to find out.

When she emerged, the anxious watchers were relieved to see the animal follow her, wagging his tail and apparently grateful for help of some kind.

Wasn't the dog mad?" asked one of the onlookers.

"Possibly he was," replied Mrs. Hutton. "You'd be mad, too, if you had a hornet caught in your mouth."—Los Angeles Times.

MISSES DON'T COUNT

Two Irishmen arranged to fight a duel with pistols. One of them was distinctly stout, and when he saw his lean adversary facing him he raised an objection.

"Bedad," he said, "I'm twice as big a target as he is, so I ought to stand twice as far away from him as he is from me."

"Be aisy now," replied his second. "I'll soon put that right."

Taking a piece of chalk from his pocket, he drew two lines down the stout man's coat, leaving a space between them the width of his lean opponent.

"Now," he said, turning to the other man, "fire away; ye spalpeen, and remember that any hits outside those chalk lines don't count."

THIN AND SALTY

A sea captain and his mate went ashore on getting into port and made for the nearest restaurant.

They ordered soup. When it arrived the captain examined the curious-looking fluid and shouted: "Here waiter, what d'ye call this?"

"Soup, sir," said the waiter.

"Soup," said the captain turning to the mate; "blame me, Bill, if you and me ain't been sailin' on soup all our lives and never knowed it."

KEEP UP COURAGE

When things seem twisted and out of joint,
Don't get discouraged and quit the game;
The corkscrew never goes straight to the point
But it gets there just the same.
—William Thomas, Wyoming.

THE BIGGEST JOB

The biggest, finest job in all the world is just being a man or a woman in whatsoever station chance happens to place you. It may be true that it takes courage to do the big things of life, but the real test of bravery comes in doing the little things that lead up to the big things.

NO CONTROL

"Don't you think Miss Howler has wonderful control of her voice?"

"No, I don't. She sings every time anyone asks her to."

A NEAT WORLD

How very neat they used to be—
The heroes of the days of yore!
They "scoured the plain" and "swept the sea"
And with their plumed hats "brushed the floor."

PHILOSOPHY

"Pa, what is philosophy?"

"Philosophy, my boy, is the gentle art of letting your creditors do all the worrying."

SO OFTEN TRUE

"I understood the text, all right," remarked Aunt Ann Peebles, after the sermon was over; "but the preacher's explanation of it puzzled me a good deal."

IS SOON APPEALED

When a man attempts to boycott his stomach, he generally finds that it is unconstitutional. — Spokane Chronicle.

A polish for stained wood floors is made of eight ounces of yellow beeswax, two quarts of spirits of turpentine and one quart of Venetian turpentine. Cut the wax in small bits and pour the spirits over it. When dissolved, as will soon happen, bottle. Dust the floors well before using the polish and apply it with a soft cloth.

A sure way to remove ink stains from wash materials is to pour a tablespoon of kerosene on the spots and rub well. Rinse in kerosene and the spots will disappear. Then wash in the usual way.

Did you ever make sandwiches of warm cheese mixed to a smooth paste with home made chili sauce? Cut the bread thin and butter it as in other sandwiches. They are delicious.

Buy a ten-cent pair of rubber heels and when you want to wear a low-heeled shoe with high-heeled rubbers; put them in the heels of the rubbers. This saves the rubbers and adds to tne comfort in walking.

Sour cream used in a white sauce in place of milk to serve with fish is not half appreciated or known.

Sometimes it does a man good to reflect that he is but a hundred-millionth part of the people of the United States.

If some people can't make a stir in the world in any other way they stir up trouble.

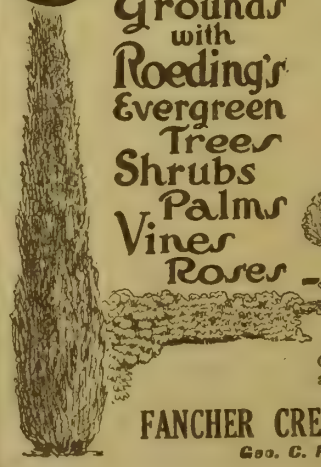
Ornament your Home Grounds with Roeding's Evergreen Trees Shrubs Palms Vines Roses



FREE LANDSCAPING SERVICE

Service is becoming a great factor in every business, and the Nursery business is no exception. Many people who have both small and large places to improve are at a loss in many cases as to the plan to follow in laying out their grounds, and also in the selection of the trees, plants and shrubs, which will as their place grows older, add to its beauty. In order to assist interested parties, we will on application mail you our SKETCH PLAN CROSS-SECTION BLANK, upon receipt of which you can make a rough sketch and mail to us, and our Landscape Department will send you a rough outline and recommendation for planting. No charge is made for this service.

PEACH PRICES

The California Peach Growers announces price list No. 6. Please note the following advance in prices, effective Saturday, November 18, 1916, at 6 p. m. All prices are f.o.b. factories, California common points, but no orders will be confirmed by us, at the following prices, unless f.o.b. factories where grades and varieties desired are available. All quotations are subject to our approval of variety and assortment, subject to our confirmation and subject to advance without notice: November, December and January shipment.

Price list No. 5 is hereby withdrawn, and ineffective after 6 p. m. Saturday, November 18, after which time prices herein quoted shall apply.

	Yellows.	Muirs.
Standard Peaches	.06¼	.06¼
Choice Peaches	.06½	.06½
Fancy Peaches	.07¼	.08⅛
Extra Fancy Peaches	.08	.08⅝
Slab Peaches	....	.05½
Choice Peeled Peaches	....	.09¾
Fancy Peeled Peaches	....	.11

Above prices bulk basis.
For 50-lb. bxs., unfaced, add ..... ½c
For 50 lb. bxs. faced, add ..... ⅝c
For 25-lb. bxs., unfaced, add ..... ⅝c
For 25-lb. bxs., faced, add ..... ⅞c
For 10-lb. bxs., unfaced, add 1¼c
For 10-lb. bxs., faced, add 1½c

For prices on graded peaches, original, in bags, add ⅞c to the bulk basis prices above quoted.

	—Per Lb.—	
Ungraded, original bags	.07⅛	.07⅜
Choice Unpld. 1-lb. cart.	.08½	.08⅝
Choice Unpld, 5-lb. cart.	.08¼	.08⅜
Fancy Unpld, 1-lb. cart.	.09¼	.09⅜
Fancy Unpld. 5-lb. cart.	.09	.09¾

	Per Lb.
Choice Peeled 2-lb. Cartons	.12
Choice Peeled 5-lb. Cartons	.11¾
Fancy Peeled 2-lb. Cartons	.13¾
Fancy Peeled 5-lb. Cartons	.13¼

The above prices are guaranteed against our own decline to March 1, 1917, and apply only to sales and shipments made direct to the recognized jobbing trade. No goods will be confirmed at above prices to Coast or Eastern brokers, or to speculators, it being our object to eliminate speculation in dried peaches, we preferring to carry our stock in storage here on the coast until actually required by the jobbing trade.

DRIED FRUITS

Wholesale quotations:
PRUNES—Bulk basis, per lb.: 30s and 40s, 6½c; 50s, 6¾c; 60s, 7¼c; 70s, 7¼c; 80s, 7½c.

Citrus Fruit Market

LOS ANGELES, Jan. 24, 1917.

A large quantity of low grade fruit is going to market, and especially into the auctions, which makes a rather distressing situation. Good fruit, however, is commanding fairly satisfactory prices.

The lemon market is materially better.

Shipments

Shipments of oranges from Southern California to date since November 1, 1916, 4264 cars, lemons 1081, total 5345; to same date last season, oranges 4384, lemons 1187, total 3571. From Central California to date this season, oranges 3909, lemons 135, total 4034; to same date last season, oranges 4097, lemons 97, total 4194. From Northern California to date this season, oranges 841, lemons 594.

FROM THE AUCTION

January 17

New York: Twelve cars navels, 1 mixed, 1 lemon. Navels, $1.30@2.75; lemons, $2.95.

Cincinnati: One car, navels, $1.75.

Boston: Five cars, navels, $1.10@2.15.

St. Louis: Six cars, navels, $1.15@2.15; lemons, $2.20@2.80.

Cleveland: Six cars, navels, $.90@2.30.

Philadelphia: Three cars, navels, $1.50@1.80; lemons, $2.10@2.45.

January 18

New York: Ten navels, 1 lemon, $1.40@2.75; lemons, $2.05@2.35.

Boston: Nine cars, navels, $1.55@2.60.

January 19

New York: Eight navels, navels, $1.50@2.65.

St. Louis: Six cars, navels, $1.45@2.20; lemons, $2.40@2.90.

Cleveland: Eight cars, navels, $1.25@2.50; bloods, $1.45; lemons, $3.05.

Boston: Two cars, navels, $1.85@2.55; lemons, $2.10.

January 22

New York: Eighteen navels, 2 lemons. All stock slightly higher. Navels, $1.40@2.80; sweets, $2.00; lemons, $1.90@3.10.

Boston: Twelve cars. Slightly better prices. Navels, $1.50@3.00; lemons, $3.90.

St. Louis: Four cars, navels, $1.70@2.25; lemons, $2.60.

January 23

New York: Twelve cars navels, 2 lemons. Navels, $1.50@2.90; sweets, $1.45@1.65; lemons, $2.60@3.05.

Boston: Eight cars, navels, $1.50@2.65; lemons, $4.00.

SULPHUR IN THE SOIL

Sulphur is as truly a plant food as is potassium, phosphorus or nitrogen. There is often a deficiency of sulphur associated with a low nitrogen content. This condition seems to be responsible for much dropping of the fruit. In some soils sulphur is so deficient as to be negative to a test showing as little as .0004 of 1 per cent. The complete failure of fruit production in many orchards of the state has been prevented by the mere accident of having fertilized with phosphorus in a form carrying incidentally some sulphur.

WEATHER CONDITIONS

For the Week Ending Jan. 20, 1917

THE SANDUSKY TRACTOR

"THE LITTLE FELLOW WITH THE BIG PULL"

15-35 Model E---Burns Kerosene

THE recognized standard of excellence in tractor construction is found in our Model E. This fact is endorsed by hundreds of users, and admitted by all engineers who are familiar with its construction.

Tractors can give only the service that is built into them. They are called upon to endure strains no other machine is expected to stand; to do their work under conditions that rack and tear any machine with a weak spot.

It is essential, therefore, that they be built of the best possible materials, by the most skilled workmen, after designs originated by the highest engineering ability, and then proved most rigidly in actual field service.

Real performance cannot be assured in untried, hasty designs or cheap construction with which the market is flooded. The Sandusky Tractor is built for service, durability and economy, and represents the greatest attainment in tractor building yet accomplished. You buy tractor certainty when you purchase the Sandusky.

It is sold on a guaranteed basis, after an actual demonstration on your own farm has shown that it is adapted to your needs and capable of doing your work, whether that be plowing, harrowing, discing, harvesting, hauling, threshing, filling the silo, shredding fodder, sawing wood, making roads or operating any belt machinery.

Brief Specifications

Our own four-cylinder, four-cycle 5 x 6½ heavy duty, slow speed, vertical motor; positive self-contained combination force feed and splash oiling system; Bennett air cleaner; three speed selective transmission, 2 to 5½ miles per hour with direct drive on low; ideal three-point spring suspension; all steel construction; small over-all dimensions and short turning brakes; easily handled; surplus cooling capacity.

A NEW PLAN—FREE SERVICE

We announce an entirely new departure in tractor selling. A coupon book for 200 hours of service goes with every Model E. This means expert service and help without charge when you want it. See catalog for details.

Our Binding Guarantee

We guarantee The Sandusky Tractor full 15 horsepower at the drawbar and 35 on the belt pulley; capable of handling at least four 14-inch moldboard plows eight inches deep where a big team can pull a 12-inch plow six inches deep; to run belt machinery up to a 32-inch separator; to have one-third reserve over its drawbar rating, and for one year against defective workmanship and material.

BOOK E-12 FREE—A 40 page book which fully describes and illustrates the distinctive design, high grade construction and exceptional ability of the Sandusky Tractor. A copy will be mailed you upon request.

If the Model E is too large for your requirements, let us send you information covering our 10-20 Model J. Ask for booklet J-12

THE DAUCH MFG. COMPANY

SANDUSKY, OHIO

The Sandusky Tractors—both Models—are ready for inspection at and delivery from our principal Factory Branches and Service Stations at: Indianapolis, Ind.; Bloomington, Ill.; Milwaukee, Wis.; Lewistown, Mont.; Minot, N. Dak.; Fargo, N. Dak.; Sioux City, Iowa; Lincoln, Nebr.; Wichita, Kans.; Dallas, Texas; Leesburg, Fla.; Los Angeles, Cal.; Sacramento, Cal.

Plowing Under Green Manure Crops

THE NEW DE LAVAL

A Bigger and Better Cream Separator for the Same Money

THE FARMER who buys a De Laval this year will get bigger and better value for his money than ever before.

Not only will he get a better machine, a simpler machine, a machine that will skim even closer than any previous De Laval, but he will get a machine of larger capacity.

And the price has not been increased one cent.

Just think what that means to cow owners in the face of rising prices on almost everything else the farmer has to buy, including other cream separators.

Only the tremendous volume of De Laval sales makes it possible to give the farmer more for his money when others are giving less.

The NEW De Laval is the culmination of nearly forty years of experience and development by the largest and oldest cream separator concern in the world. It represents

The greatest improvement in separator construction in the last thirty years

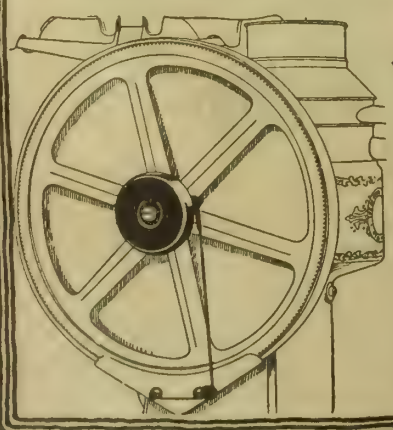
If you are trying to get along without a cream separator, or with a half-worn-out or unreliable machine, why not get a NEW De Laval NOW and stop your cream waste? You don't need to count the cost, because the De Laval will soon pay for itself.

There is a De Laval agent near you who will be glad to explain all the improvements and advantages of the NEW De Laval, and who will set and start a machine for you on your farm and let you try it for yourself.

If you haven't the spare cash right now, that need not stand in the way of your having the use of a NEW De Laval the rest of the winter. We have an arrangement with De Laval agents which makes it possible for any reputable farmer to secure a De Laval on the partial payment plan—a small payment at the time of purchase and the balance in several installments—so that your De Laval will actually pay for itself while you are using it and getting the benefit from it.

Why not see the nearest De Laval agent at once? If you do not know him, write to the nearest office for any desired information.

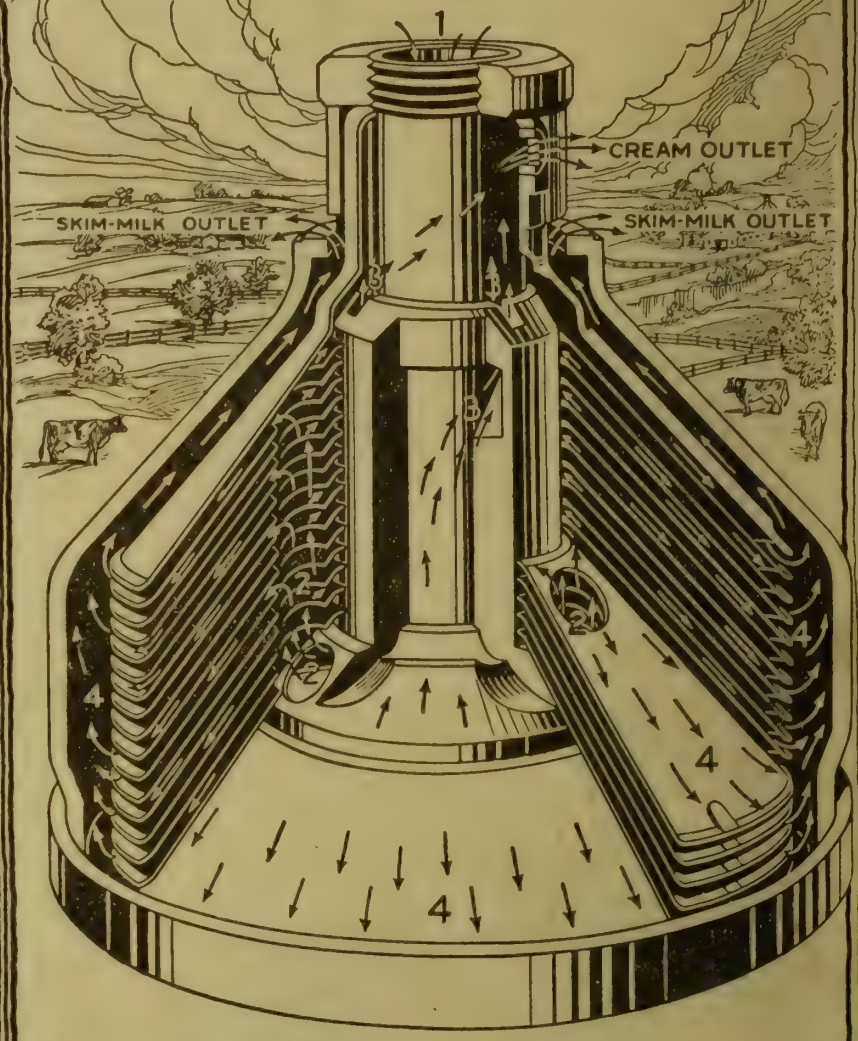
Every NEW DE LAVAL is now equipped with a Bell Speed-Indicator



"The Warning Signal" which insures proper speed and uniform cream

Because nine people out of ten turn the separator handle too slowly and because this always means loss of cream and cream of uneven thickness, every cream separator should be equipped with a reliable speed indicator.

Every NEW De Laval is now so equipped. The De Laval Bell Speed-Indicator is simple. It is accurate. It is reliable. There is nothing to wear out or get out of order. No matter who runs your De Laval, the "warning signal" will tell you when the speed is not right. You hear it and do not need to see it.



THE NEW SELF-CENTERING DE LAVAL BOWL

Some of the points of superiority of the NEW DE LAVAL

The New De Laval bowl design and the new method of delivering the milk into the discs give increased capacity without increasing the weight or size of the bowl or increasing its speed. The incoming whole milk is delivered beyond the cream wall, and this, in conjunction with the improved design of the bowl, makes possible closer skimming than ever before, especially under the more difficult conditions of separation, such as skimming a very heavy cream or separating milk below usual temperature.

The much lower speed of the De Laval than other cream separators (in most cases from one-half to one-third less) insures minimum wear of gears and much longer life of the machine.

The New De Laval concave-bottom, self-centering bowl is so designed and so supported by the detached spindle that it will run true and do perfect work even after long wear, the great importance of which every separator user will appreciate.

There are fewer discs in the New De Laval bowl, and all discs are unnumbered and are interchangeable.

By reason of its simpler construction and the fewer number of discs, the New De Laval bowl is more easily washed and cleansed.

All New De Lavals are automatically oiled, every moving part of the machine being bathed in a constant film of oil. There are no oil holes anywhere on the machine, and the sight feed oil cup on the top of the frame provides for a constant supply of fresh oil.

The gears, pinions and other moving parts of the De Laval are exceedingly simple in arrangement, substantial in dimensions and always interchangeable.

The De Laval tinware is sturdy and heavily tinned, well suited for long and hard wear, and easy to clean.

The low speed of the De Laval bowl, in combination with greater capacity for a given size and weight of bowl than is found in other separators and the automatic De Laval oiling system, make the De Laval the easiest cream separator to turn.

New Catalog will be mailed upon request

Handling Green Manure Crop in the Spring

Prof. R. S. Vaile of the Citrus Experiment Station Staff Gives Information as to Time of Turning Under. He Says That Cover Crops Should be Plowed Under in Preference to Disking and Discusses General Fertilization of the Orchard

ESTIMATES made from the amounts of cover crop seed distributed in Southern California indicate that some 94,000 orchard acres are at present planted to one of the legume crops as against about 70,000 acres one year ago. There is doubtless a considerable additional acreage planted to non-leguminous crops. With so large an acreage growing green manure crops it is fitting that considerable attention be given to the handling of such crops in the spring. All of the good which the cover crop is capable of doing may be dissipated, and actual injury may be done by wrong methods during the next few weeks. The following suggestions have come to the writer through observations made throughout Southern California during the past several seasons.

As a general rule the turning down of the cover crop should be completed before the middle of March.

Cover crops should be plowed under in preference to disking.

A large proportion, or possibly all, of the fertilizer material to be applied during the season may well be plowed under with the green manure crop.

Plow Early

It is frequently true that green manure crops have not reached their maximum development by late February. If left standing until April the tonnage might be increased in considerable amounts. This increase in tonnage of organic material would possess considerable value. On the other hand, however, there is a large risk involved of allowing the ground to become too dry or too low in available nitrogen just at a time when the trees are putting forth a growth that particularly requires both moisture and food for successful development. Last season, with the absence of late rains —and frequently late rains are absent —there was a very large acreage where the trees apparently suffered either for lack of moisture or nitrogen, or both, before the green manure crop turned under in April or May could possibly be available. Whenever the plowing was done during February or early March, while the moisture conditions were right, groves went through the spring in fine vigor.

The opinion is sometimes expressed that when cover crops are plowed under early they decay too rapidly, while the mature crops are of more lasting benefit to the soil. It is not, however, the material which remains visible to the eye that feeds the tree. The object of soil management is not to increase to any great extent the amounts of plant food or organic material in that soil, but rather to maintain a sufficient, readily available supply for the demands of the crop. In order to meet the demands of citrus trees the moisture and nitrogen supplies must be large and readily available during the spring. If an ample supply of cheap water is available to supplement light rainfall, and if a small amount of soluble nitrogen is added during February, it may be a justifiable practice to leave the plowing until late. Even then it is difficult to plow after irrigation when the ground is in as uniform a condition as following a rain. It is surely a safer practice, and over a long period of years almost as surely a better practice, to plow early so that the ground may be naturally settled by the late rains, and the processes of decay may furnish abundant soluble plant food.

Plowing Preferable to Disking

With our present system of summer cultivation the deep incorporation of all plant foods is to be desired. During the summer the surface soil is exposed to extreme heat and dryness, thus burning out organic material and checking bacterial action. Furthermore, the roots are kept out of the cultivated soil entirely. Therefore, in order that the contents of the cover crop may be in reach of the trees, a large part of it must be turned under deeper than the point of summer cultivation.

The suggestion is occasionally made that in plowing, while the tops are inverted, the roots with their nodules are turned to the surface. In part this is true, but estimates made carefully by many different investigators throughout the country indicate quite clearly that the tops contain between two-thirds and three-fourths of the total nitrogen of the plant. While the bacteria which form the nodules are the agency responsible for any collection of nitrogen from the air, yet the plant can and does assimilate a large part of such nitrogen in its growing top.

It is frequently desirable for expediency in handling the work to disk the orchard crossways to the irrigation furrows and then plow with the furrows. This may be a very satisfactory method. Usually the growth between the trees is shorter than with the furrows because of less moisture during the fall, and also there is frequently less demand by the tree roots for plant food because moisture is not maintained to make it available.

Plow Under Fertilizer

The same problem which has been mentioned above, namely, getting the plant food down to the roots, applies to other fertilizing materials as well as to green manure crops. Doctor McBeth has gathered a great deal of evidence that furrow irrigation tends to concentrate a large percentage of the soluble nitrates in the surface soil from which tree roots are excluded. The deeper the plant food is originally placed, the better chance it has of being carried on down to a zone where the roots can utilize it.

These studies of McBeth have suggested that fertilizer should be applied deeper than the summer cultivation. A fairly satisfactory method to employ is to scatter the fertilizer broadcast and plow it under with the cover crop. The writer is inclined to think that some day a practical drill attachment to be used directly on the plow, dropping the fertilizer into the bottom of the furrow, will be devised.

Plowing itself is, of course, an art. The tool, the horse power, and the operator must each be fitted to the requirements. The writer favors a moldboard to a disk plow as a general thing for covering green manure crops. The moldboard, with a good colter and chain, can certainly be made to do very fine work. On the other hand a 14-inch moldboard does much better work than a smaller one, and where horse power is available even a 16-inch plow is to be desired. This of course necessitates four horses. When a disk plow is used attention should be given to the size and position of the scrapers so that the soil may be as completely unveiled as possible.

An Exposition of Citrus Fruits

Oranges and Lemons Will Make California's Greatest Show of Citrus Fruits at San Bernardino

THE management of the National Orange Show is proposing to make this the greatest exhibit of citrus fruits and products ever. The show will open on February 20. World honors will be awarded for the best quality fruits. There will be many striking features. Northern as well as Southern California citrus districts will compete. Several large tents will house the exhibits. California has some of the finest citrus fruits ever grown and this year's show should be the most successful one.

Besides citrus fruits there will be many orchard and packing house appliances. How to plant, cultivate, irrigate, prune, fumigate, spray, fight frost; how to pick, pack and handle the fruit, and a thousand and one other questions as to the how of the citrus industry may be answered, also the question of "what with?"

Go if you know all about the industry. Go if you don't.

There will be fun provided for the kiddies.

All may go on the railways at reduced rates.

Spraying for June Drop of Navels

By J. Eliot Coit

ORANGE growers in the San Joaquin Valley have recently taken considerable interest in the possibility of controlling June drop of the navel orange by spraying with fungicides during the winter and spring. In view of the present state of our knowledge in regard to the life history and habits of the fungus which is responsible for black heart rot of the navel and in all probability is also vitally connected with the June drop it is but fair to state that spraying experiments have only just been started and the final results will not be known until next fall. At present we do not know whether spraying will have any effect on the June drop. It is to be hoped that spraying may prove efficacious but hopes and facts are far from being the same. Spraying can do no harm, and if some growers decide to take a chance and spray anyway with the idea that some good may be accomplished, there can be no objection, provided such growers do so with the full understanding that spraying has not yet been recommended by those most conversant with June drop problems; that they are getting ahead of the game and are spending their money in anticipation of results which may or may not materialize during the next year.

There are a number of points in connection with the mode of infection of the blossoms which cannot be cleared up before the next blossoming season. If it is found that infection takes place only in the blossom it is difficult to conceive how spraying the trees in winter could have any effect other than producing a more sanitary condition around the trees. If it is found that the fungus overwinters chiefly in the black rot oranges lying under the trees, spraying had better be directed toward soaking these mummied fruits. Again it may prove cheaper to gather up these mummies after the harvest and burn them rather than to attempt to sterilize them with fungicides. Because a certain trouble may be due to a fun it does not always follow that spraying with fungicides is the proper remedy.

The June drop problem is a very complicated one and while much progress has already been made, the final solution is yet to be achieved.

Citrus Canker in Florida

"The importance of preventing the entrance of citrus canker into the state cannot be overemphasized," is a warning just issued by the state horticultural commissioner. Two telegrams were recently received by Commissioner Hecke. The first is a statement of the cost of eradication in Florida by Dr. Kellerman, assistant chief of the bureau of plant industry, as follows:

Federal appropriation for citrus canker 1915, $35,000.

Federal appropriation for citrus canker 1916, $550,000.

Florida legislature appropriated $195,000.

Florida fruit interests appropriated $100,000.

Estimated total cost this year, $600,000.

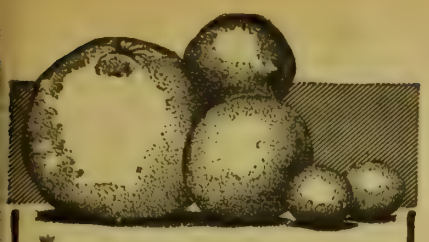
The second telegram came from Professor Wilmon Newell, plant commissioner of Florida, in response to an inquiry regarding compensation to the grower for the destruction of his trees. This message stated:

"Florida growers are not compensated for destruction of trees on account of canker either by state or government."

From these two telegrams it will be seen that there is a very heavy expense attached to the attempted citrus canker eradication work in Florida and that the grower whose trees are diseased suffers the loss of his property with no compensation. Consider what this disease would mean should it get started in California. If at any time there should be a suspicion on the part of a county commissioner or inspector that this disease exists in any part of the state, this office would be grateful for immediate notification and details regarding the supposed infestation. While we greatly hope that it will never get into our groves, should it do so we would like to be able to detect it at the start and if possible eradicate it before the expenditure of large sums of money, as in Florida, would become necessary.

LOAD AND UNLOAD

The Railway Age Gazette gives some interesting information in an analysis of a typical freight car's journey. There are several columns given to the story of this car. In this item we note the average time per trip for each car is 17.72 days. Out of this nearly 18 days devoted to each trip the time in trains, both loaded and empty, is 1.6 days, the time allowed for loading by ordinary demurrage rules, two days, for unloading two days. Other time required, such as in repair yards, at terminals and interchanging points between carriers, and time necessarily idle and of course occasionally in company service aggregates another 12 days. The Gazette suggests a necessary reduction, and to accomplish it recommends a slight increase of speed, reduction of time in repair yards, still greater reduction in time at terminals and interchanging points, and reduction of the time the car is idle. It still leaves two days for loading and two days for unloading. It appeals to us that this time might also be reduced. Take for instance the orange shippers of California. We believe there are but few packing houses which require an average of two days for loading, and except in cold weather on Eastern sidings their unloading should be accomplished in much less than two days. Sure it is there is a shortage of cars and when the orange shipping season is in full swing the shortage will be still more serious. This of course is only one phase of the car shortage but until more cars can be provided or crops reduced every precaution should be taken.



PROFIT comes from fruit, not foliage. On Citrus fruits use immediately available

PLANT CITRUS

Written for California Cultivator

AND now comes the shortage in citrus trees and as a result everybody wants them. The larger nurseries are reporting stocks already low, and some orders from those who wish to make large plantings have of necessity been refused. Two years ago citrus stock went begging and, not stopping to think that it takes years to produce a bearing citrus orchard, planters preferred to wait until the prices of citrus fruits and the demand for them was such that the immediate prospect was good. The Cultivator might preach from now until doomsday, and the same conditions would prevail. The same spirit is shown in large cities where it is proverbial that when prices of material are high and labor almost impossible to secure, then the greatest building operations proceed. This season and some others within the past few years have shown many sections to be fitted for citrus culture and many that were not. So it is possible the backward planter has done well to wait and make careful observation of all the conditions. It costs a great sum and takes years to make a bearing orchard so thorough consideration of all the conditions which will confront the orchardists should be given; then plant.

REGULATIONS FOR IMPORTING ORANGE SEED

The season for importing orange seed into California for propagation purposes will soon be at hand. Florida is the one source of supply of sour orange seed available to our planters at this time, therefore the quarantine division has made the following regulations covering the bringing into California of orange seed from Florida:

The shipper must obtain a certificate from the plant commissioner of Florida for each individual shipment, and the certificate must be produced by the consignee before the seed will be released. To obtain this certificate the shipper must swear to an affidavit naming the location in which the seed was collected and the fact that the same has been treated as prescribed. No certificate will be issued for seed collected in any locality where canker has been found or within a fixed distance of the nearest recorded infection.

COLD STORAGE OF CITRUS

We note in Cold, a paper devoted to refrigeration that:

"The best holding temperatures for citrus fruits are somewhat higher than most other fruits demand. Grapefruit should be held at 45 to 50 degrees, oranges at 42 degrees, and lemons at 42 degrees. At lower temperatures the brown stain which is the most common source of loss in stored citrus fruit develops more rapidly than at the temperatures given above. In all cases frequent inspection should be made so that the fruit can be sold as soon as decay appears.

"As in the cases of other fruits intended for storage, it is necessary to practice the most careful handling at all stages and to store promptly after picking. Bruised or punctured fruits will not only spoil themselves, but will quickly cause decay in other fruits that are packed with them."

Wood ashes contain lime and in addition some other valuable plant foods. Two and a half tons of wood ashes have about the same value in correcting acidity as one ton of burnt lime.

TALKS ON
Nitrogenous Fertilization

Number 8

IT is a fact that California soils respond promptly and generously to intelligent fertilization. This is particularly true concerning nitrogen, in which important plant-food element so many soils are deficient. But as is always the case, some forms of nitrogen are better than others.

SULPHATE OF AMMONIA

Sulphate of Ammonia, because it is in the form of a sulphate, gives particularly good results on California soils, not only because of the nitrogen it supplies, but because it aids in bringing the soil into good mechanical condition.

It benefits *all* crops, in the orchard, garden and field.

The Kadota Fig

PROF. IRA J. CONDIT of the division of citriculture, Berkeley, has made extensive investigations as to the behavior of the Kadota fig in different sections of the state. This fig has proven of remarkably fine quality, and from a history of the fig and description of its good points we quote:

By Ira J. Condit, Division of Citriculture, Berkeley

Commercial fig culture in California has so far depended mainly upon three varieties, the Calimyrna, Adriatic, and Mission. Other aspirants for favor have appeared from time to time but these three seem to predominate especially as regards the production of dried figs. Recently a variety commonly known as Kadota has been propagated and distributed in large quantities principally in Tulare County. The history of this variety so far as determined by the writer is as follows:

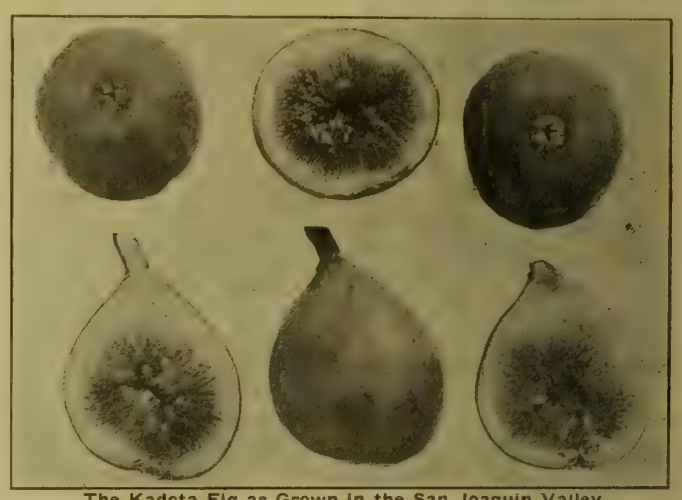
In 1887 a nurseryman of Orange County obtained some fig cuttings from Southern Europe under the name Dottato. Some of these were planted by Theodore Hockett on his place near Orange where they grew and fruited. (A recent visit by Mr. Roy Bishop and the writer to the old Theodore Hockett place near Orange failed to reveal the presence of any fig trees except one which appeared to be the Brown Ischia. The place has changed hands several times since Mr. Hockett owned it.) In 1895 Cyrus Way of Whittier obtained three cuttings from Mr. Hockett and planted them in his dooryard where one of the trees is still growing. In 1898 Stephen H. Taft of Sawtelle gave an address in Whittier and stayed over night with his friend Mr. Way. In the morning they were in the yard looking at various plants, among them the fig tree, and after sampling the fruit Mr. Taft remarked that it was of unusual excellence. Mr. Way replied that he also thought very highly of it and that he got better prices for the fresh figs than for those of other varieties.

* * *

The history of different trees which are planted in Tulare County, some under the name of Datato, others under the name of the White Pacific, is traced by Mr. Condit. One planted at Pomona under the name of the White Dottato, which was regarded as an exceptionally fine white fig, is also thought to be the same fig. Comparison of these figs in different parts of the state is shown in engravings above.

The Kadota Fig as Grown in Los Angeles and Orange Counties

The kadota figs as grown in Los Angeles and Orange Counties are larger than those grown in Central California. They have a distinct neck, are green and glossy and have more or less distinct violet tint to the flesh.



The Kadota Fig as Grown in the San Joaquin Valley

—Photos by Division of Citriculture, University of California.

There is material difference in the appearance of the kadota fig as it grows in the San Joaquin Valley, where it is lemon yellow, amber-fleshed, oblique in shape, without distinct neck.

New Secretary to State Horticultural Commissioner

Mr. E. J. Vosler, secretary of the state horticultural commission, will leave California on January 30 for collection work in Australia with the particular purpose of finding parasitic enemies to control the beet leaf-hopper, which as carrier of the germ of the beet leaf curl disease, has caused considerable loss to the sugar beet farmer. Mr. Vosler was assistant superintendent of the state insectary before his appointment to the secretaryship of the commission. His thorough entomological training and his valuable experience in the state insectary will enable him to carefully

investigate and search for suitable parasitical material.

His successor to the secretaryship of the horticultural commission will be H. S. Maddox, who as manager of the Yolo horticultural exhibit at the P. P. I. E. exposition and the secretary of the board of trade of the same county, has become known throughout California as one of the foremost publicity men of the state. The commission has felt the need of service in this line of work, and Mr. Maddox is well qualified to become a valuable additional to the staff.

ARIZONA EXTENSION SCHOOL

The agricultural extension service of the University of Arizona is planning a series of institutes in Cochise County, Specialists from the university and farm advisers and others connected with the department of agriculture will unite in the programs. The first will be held in Webb school house Wednesday and Thursday, February 14 and 15. The first day's program will be a formal one in which E. P. Taylor, director of agricultural extension service, will talk upon potato growing and gardening, Mrs. Salisbury on household conveniences, G. W. Barnes, live stock specialist, on getting started in the dairy business, E. P. Taylor on the home orchard with pruning demonstration and A. L. Paschall, county agent, on crop rotation. At noon there will be a basket lunch and in the evening illustrated lantern slide lectures.

The next day the forenoon will be given to discussion of foods and cooking by Mrs. Salisbury and the remainder of the day to that most valuable of all institutes, field meetings and demonstrations. These will be in charge of A. L. Enger, irrigation engineer.

On February 16 an institute will be held at the Stewart school house seven miles north of Willcox, and the meeting of Saturday, February 17, will be at the San Simon school house. In both of these latter meetings the program will be somewhat similar to the formal first day meeting at Webb school house.

TO EXPOSITION PARK

We recently gave an item regarding the permanent exposition located in the city of Los Angeles. The article attracted the attention of some of our subscribers to this excellent institution mainained by California and free to all visitors who wish to inspect its magnificent exhibits and inquiry was made as to how to reach the grounds. In answering such inquiry we referred to certain car lines. Mr. Davison now sends correction. In order to reach the grounds take any of the following cars: University lines, Vermont-Georgia, and cross-town Vermont, on the west; East Jefferson (Ascot Park-Exposition Park) and the Santa Monica air line, on the north; Grand Avenue lines (one from North Broadway and one from North Main), Hawthorne-Eagle Rock, and the Vermont Heights cars on the south.

SHORT ON GRANDFATHER

The lady of good family was showing her ancestral home to her small son. She pointed with special pride to a bust of her father.

"And that, Robbie," she said, "is your grandfather."

"Is that all there was of him?" he asked.

AS OTHERS SEE US

She (at the opera)—Don't you think Miss Screecher strains her voice when she sings?

He—Perhaps; but if she does, she uses a mighty poor strainer.

JOHN DEERE IMPLEMENTS

BETTER FARM IMPLEMENTS AND HOW TO USE THEM

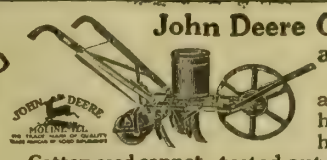
BOOK FREE 156 page reference book—tells all about a complete line of farm implements and how to adjust and use many of them. A practical encyclopedia of farm implements. Worth dollars.

Describes and illustrates Plows for Tractors; Walking and Riding Plows; Disc Plows; Cultivators; Spring Tooth and Spike Tooth Harrows; Disc Harrows; Alfalfa and Beet Tools; Farm and Mountain Wagons; Manure Spreaders; Inside Cup and Portable Grain Elevators; Corn Shellers; Hay Loaders; Stackers; Rakes; Mowers and Side Delivery Rakes; Hay Presses; Kaffir Headers; Grain Drills; Seeders; Grain and Corn Binders.

This book will be sent free to everyone stating what implements he is interested in and asking for Package No. X-111.

JOHN DEERE, MOLINE, ILL.

John Deere Combined Cotton and Corn Planters



John Deere Cotton and Corn Planters are highly successful. They have been thoroughly tested out through years of satisfactory field use. A cotton picker wheel extends through the bottom of the hopper. This wheel revolves in one direction and the cotton spider in the other—separating the seed without damaging it. Change in quantity is made by turning a thumb nut on the hopper.

Hoppers are beaded. Seed plates fit perfectly. All the seed in the hopper is planted. Peanut plates or a special hopper can be furnished for planting shelled or unshelled peanuts.

Cotton seed cannot choke up in the hopper—a cotton picker wheel prevents it.

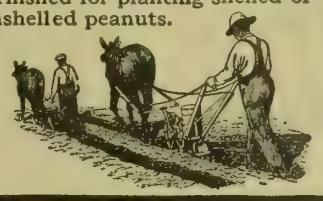
John Deere *OBLIQUE SELECTION, HORIZONTAL CELL DELIVERY SEED PLATE* for corn—an accurate drop.

Positive gear drive with dirt-proof gear case.

Special shaped shovel with reversible points opens furrow and pulverizes the soil without throwing it up on the face of the shovel. Soil falls behind and covers the seed.

Adjustable press wheel can be furnished. No lever used on this press wheel.

Depth of planting can be regulated with the foot while planter is in motion.



John Deere Plows for Light Tractors

So far as quality of John Deere Plows for Light Tractors is concerned, they are built for the farmer who realizes that it is business judgment to buy a high grade tractor plow. Don't forget that a tractor plow is not an everyday purchase.

John Deere Plows for Light Tractors are noted for their high grade work in the field—the real test of tractor plow value.

Before you make your purchase, be sure to see John Deere Plows for Light Tractors. A careful purchase means a permanent saving.

The John Deere Light Tractor Disc Plow works with any standard tractor—the hitch is adjustable.

Three or four discs.

Discs have a double setting. Taking care of all conditions where a disc plow can be expected to operate.

Adjustable scrapers keep discs clean and lighten the draft.

No choking in trashy ground—frame is high, beams are dropped, which gives good clearance under the frame, and there is plenty of room between the discs for trash to pass through.

John Deere Spreader

The Spreader with the Beater on the Axle

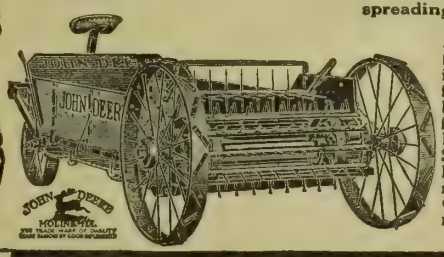
Mounting the beater on the axle simplified the construction, eliminated troublesome parts and made possible a successful low-down spreader with big drive wheels. There are no shafts to get out of line, no chains to cause trouble, and no clutches to adjust. The only spreader with beater and beater drive mounted on axle.

Low down, with big drive wheels out of the way. Easy to load.

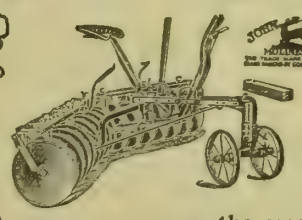
Revolving rake, driven by manure moving toward the beater—no bunching of manure. Ball bearing eccentric apron-drive—a new and exclusive driving device.

Makes uniform spreading certain.

Wide spread attachment for spreading seven feet wide can be furnished for the John Deere Spreader. No chains nor gears. Quickly removed.



John Deere Model "B" Disc Harrow



Using a disc harrow before plowing pulverizes surface lumps, works trash into the seed bed and prevents the escape of moisture. Then when the furrow slice is turned, the trash decays rapidly and no large air spaces are left between bottom of furrow and the turned furrow slice. Water in the subsoil can make its way into the seed bed and plant roots can penetrate to deeper soils.

Discing after plowing removes the weeds, and makes the seed bed compact, but not hard. The discs break up lumps of soil.

The Model "B" pulverizes at even depth its entire width.

Patented spring pressure third lever—inner ends of gangs can be given light or heavy pressure to disc over ridges or cut out dead furrows without burying the harrow.

Independent gangs. All tendency of gangs to crowd to one side is easily overcome by giving them the proper relative angle.

Flexible—only that part of the Model "B" harrow passing over an obstruction is lifted out of the ground.

Rear section can be furnished to make a double action harrow.

John Deere Syracuse Plows

Syracuse Plows have an enviable field record among farmers in chilled or combination plow territory

Here is a feature that is appreciated by the man who buys a Syracuse Plow. Extras ordered will be duplicates of the original parts. Bolt holes will be in the right place. Every part will fit. In fact all necessary parts that go into a Syracuse Plow could be ordered as repairs and when received built into a complete plow. Extra parts are exact duplicates—no trouble results.

Remember, Syracuse quality is uniform.

John Deere-Syracuse Sloping Landside Chilled Plows are unsurpassed for general purpose work in light soils. They leave a clean, open furrow bottom.

Share and shin piece combined—a fresh, clean cutting edge obtained with each new share.

Index or set-over style of beam—easily shifted to give the plow more or less land.

Equipped with Syracuse Chilled Moldboards—noted for satisfactory scouring qualities, strength and uniformity. Right and left hand styles.

John Deere-Syracuse Sloping Landside Chilled Plow

THE JOHN DEERE TRADE MARK

To designate and brand their goods, "Deere & Company," use the "leaping deer" trade mark. It is the best known implement trade mark in the world.

The reason that it is so well known is because of the high quality of the implements themselves.

Prestige in farm implements is obtained solely through the superior merits of the goods.

The permanent prestige of John Deere implements has been maintained by the company's strict adherence to principles of manufacture that originally made the goods popular.

The "leaping deer" trade mark is Deere & Company's stamp of approval. It distinguishes John Deere Implements from inferior goods. It means that the implement was made in a John Deere factory, in the John Deere way. It is a guarantee of satisfaction and an insurance policy against disappointment.

Look for the John Deere trade mark when you buy.

The Vegetable Garden

February Planting Calendar for Southern California

Written for California Cultivator By D. F. Reichard

CALIFORNIA ranchers are many times criticized for not growing their own vegetables. The ranchers plead that in specialized farming there is no place or time for home vegetable growing. This is true where the crop grown produces over $150 per acre, but where the yearly return from an acre is less a part of an acre set aside and cultivated for the home supply of vegetables will pay, if well cared for, better than the rest of the ranch proportionately.

Aside from doing away with the vegetable bill the home garden gives the fresh, crisp product at the time it is to be used, which is an important part of the vegetable portion of one's diet. It is very wise, too, especially in Southern California, that we should eat more vegetables than meat on account of the warm climate. The vegetable garden is also conducive to sociability. Did you ever notice how, when people gather where there is a well kept garden they always want to go out and "see what there is" and "sample" the different things? It brings you to know others as you would never know them.

Having selected a spot for the garden draw a plan of it, no matter how rough, jotting down what you want to plant and where and how much. If you do not know how much seed or the number of plants needed for a given space ask a seedsman. A well planned garden on a plot of ground 50 by 50 feet will produce enough vegetables, except potatoes, for a small family by one person working in it only an average of an hour a day.

If one is planning a permanent garden arrange so that the perennials, such as artichokes, rhubarb and asparagus, are in rows at the side of the plot. If berries are desired put them also at the side. The center is kept clear for the annual quick growing stuff.

February is our heaviest planting month provided the weather is warm. Plant all the hardier varieties of vegetables. The tender plants, like beans, tomatoes, peppers, squash and cucumbers can only be planted in very favorable spots that are free from frost.

It will be wise this year to work up the ground again as the heavy rains of the last month or so have made a crust and unless this is broken up the moisture soon evaporates.

Potatoes may be planted this month in all but low ground; even though the tops are cut back by frost they will sprout out again. Plant stock and sugar beets. As the winter garden is used up fertilize and work it up in preparation for more summer stuff.

Spray your trees and shrubs for fungi either with Bordeaux mixture or lime-sulphur solution before the buds begin to swell. Lime-sulphur is also a good spray to treat black scale.

Any plant that needs pruning should be attended to at once as not to lose too much sap. Paint the fresh cuts over with some old stiff paint or grafting wax. Paint a strip of Tanglefoot around the trees to prevent insects from crawling up. It will be a big saving in fighting pests.

February Planting Calendar for Northern California

Written for California Cultivator By A. R. Gould

OWING to the very severe weather we have experienced we shall find that although we put in a few subjects early they are hardly through the soil yet, and small wonder when for a few mornings in January in many places in the Northern and Central parts of the state the temperature was down to 20 degrees and even 18, with some portions of the garden frozen all day long and unworkable, but happily this does not come every year nor does it last long, and it also has its good points and beneficial effects upon the soil, and that portion of the garden which had been plowed or dug a month or so ago was after the recent frost in fine working condition, the surface actually working to a powder. The writer took the opportunity of sowing several rows 100 feet long of carrots, turnips, lettuce and peas (varieties mentioned last month) in open spaces in the orchard, not forgetting to leave ample space between the rows for cultuvating later on. Such a scheme allows of more extended planting in the vegetable garden, and the rains which we hope to see shortly will do their good work and should carry these crops through to maturity. After the peas are off we shall follow up with tomatoes, which later crop will then secure the benefit of the reserves of nitrogen left in the soil. I feel sure that these records and practical observations will prove of interest and some value and that more than one reader will keep all these points in mind.

Peas

The frost has been hard on this crop which had reached the flowering stage around San Leandro and Hayward, and several acres in the former district were practically ruined where it happened to be growing on flat open ground, but one fortunate grower at Hayward who has 100 acres on the warm side of a hill escaped with a small fortune as he expects to start picking some time this month. There are planting lessons to be learned here. Look to your location when planting on a large scale.

Successional sowings of Little Marvel, Blue Bantam, Stratagem, Senator, Hosford's Market Garden and Melting Sugar may be made this month.

Onion Sets

These miniature onions if planted now on fairly rich soil in rows 15 inches apart and three inches apart in the rows will prove valuable for use in the green state in a few months or may be grown on for an early crop.

Carrots

Continue to make sowings of French Forcing and Danvers Half-long. If your soil is somewhat heavy sow Oxheart, which is a short, stump rooted type, a fine cropper.

Cabbage, Broccoli and Kale

If these were sown too thickly they may require thinning out, which should be attended to, and this will then allow those remaining enough room for further development. We presume these were sown last month as advised. Have your ground also selected and prepared for putting out

these plants in due course.

Turnips

Make another sowing this month of Early Snowball and Early White Milan. Also sow Orange Jelly, a fine flavored yellow variety.

Lettuce

Continue to sow Big Boston, Early Curled Simpson and White Paris Cos; also try May King and Deacon, both splendid varieties.

An economical way of growing lettuce in the early spring is to sow in rows across the garden and thin out plants later to 10 or 12 inches apart, using the surplus plants to plant up other rows. Young plants may also be planted between the rows of peas providing the space between is 18 inches or so wide and has been kept clean weeded. The lettuce will derive nitrogen from the pea crop and it will also prevent a waste of space. The writer has adopted this method for several years successfully and is a firm believer in intensive culture.

Radishes

Sow on a well prepared border the following varieties: Early Scarlet Turnip, Early Scarlet Globe and Scarlet Turnip White Tipped. See that this crop is well supplied with water.

Rhubarb

Plant roots of Myatt's Victoria and Strawberry varieties in beds which have been richly manured. Plant the crowns well under the surface of the soil at distances of three feet apart in rows.

If you desire to secure some rhubarb early take a deep box, make up a mixture of stable manure and garden soil, plant your roots in this and water well. Place this in a dark shed or in the cellar and water every three weeks or so. You will by this method be able to secure forced rhubarb. Plant good strong roots for this purpose.

Tomatoes

Secure seed of the following varieties for sowing next month: Victoria Whole Salad, one of the very best, Trophy, Earliana and San Jose Canner.

Celery

You may also get the seed of this for next month. White Plume, Golden Self-Blanching and Columbia are all good varieties to grow.

Asparagus

Roots of these may be planted in well manured and prepared beds which should be about three feet wide and quite four feet apart. This then allows space between for irrigation. Plant the roots in single rows the length of the beds three feet apart in the row. The best varieties are Concover's Colossal and Palmetto.

Labor Saver in the Garden

The Ornamental Garden

February Planting Calendar for Northern California

Written for California Cultivator By A. R. Gould

THIS is the busy month for planting trees and shrubs, as it is now getting late, and such work should soon be completed or the largest part of it.

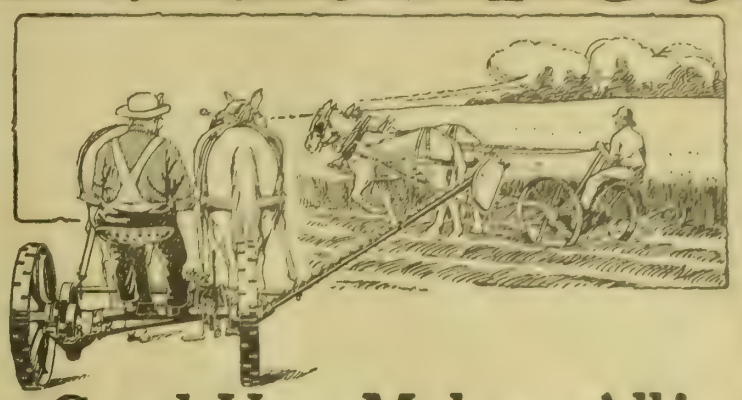
Some of the late flowering shrubs may still be planted and the following are very desirable: Symphoricarpus racemosus, Weigela candida, Viburnum Opulus, Spirea "Anthony Waterer" and S. "Van Houten", Tamarix Africana (also very suitable for situations close to the sea); Genista tinctoria, Deutzia gracilis, Deutzia crenata Watereri, Kerria Japonica and Hypericun densiflorum, Hydrangea hortensis is especially useful for planting in shady situations.

Conifers

No garden is complete without a few of the beautiful subjects which make up this group, and the following are the best and make noble specimens if planted alone: Cedrus deodara, Cedrus atlantica glauca, Cedrus Libani, Cupressus guadalupensis glaucus, Juniperus Bermudiana, Picea pungens glauca, Pinus excelsa and P. Strobus, Retinospora plumosa, Thuya globosa aurea, Tsuga Canadensis Sargentii pendula. An ideal conifer to plant as a hedge to keep out the dust is Cupressus macrocarpa (Monterey Cypress).

Palms Versus Deciduous Trees

One of our contemporaries recently put forth a great plea for palms and preached little else, as they were evergreen the year round and the deciduous trees gave things a winter look. However there is hardly a more beautiful tree even without its leaves than Betula alba and its variety B. a. lacinata pendula and an avenue of the red or white flowering chestnut (Hippocastanum rubicund and H. flore pleno), is a sight to behold when in flower. Palms look their best in the tropics and only Phoenix canariensis, Washingtonia robusta and Livistonia Australis appear to do very well in our section of the state, but even these should not be mixed up with conifers and deciduous trees when a place is being laid out. We are inclined to the view that considering the wide range of selection that conifers are ideal as



Good Hay-Makers All!

HAY fields without **International Harvester** mowers, rakes and tedders upon them at some time in the season, give you almost as strange a situation as hayfields without hay. That is how popular **Champion, Deering, McCormick, Milwaukee, Osborne and Plano** hay tools have been on thousands upon thousands of farms for seventy-five years.

Last year 40,000,000 American acres were mowed by mowers on each of which was one of these names. That means they are very good mowers. Just as good rakes and tedders followed. If your own hay making is not being done by hay tools chosen from these lines, at least it is certain that they are doing the work for the majority of your neighbors. This year there will be more than ever sold, and they will be better built than ever.

Choose an **International Harvester** mower, rake and tedder. That means good, easy hay making, long service, prompt repair service if you need it. **Champion, Deering, McCormick, Milwaukee, Osborne and Plano**—safe names in the haying season. Write us for a catalogue on any line. Get posted early.

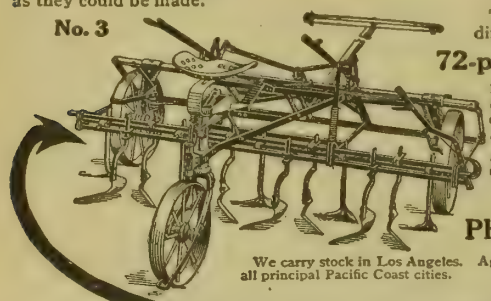
Greatest time and labor-saver for beets and beans

This No. 3 Planet Jr 4-row Sugar Beet and Bean Cultivator is a real money-maker for extensive beet and bean growers. It thoroughly cultivates 4 rows of beets at one passage 18 to 22 inches apart. The patent shield hoes run close without covering plants or injuring roots. All steels, specially hardened, hold shape, keep sharp, and add 50 per cent. to wear.

Planet Jr Beet and Bean Cultivator

"I consider your Beet Cultivator by far the best I have ever seen or used" writes H. H. Castwood, Oxnard, Cal. "I consider the knives and sweeps as near to perfection as they could be made."

No. 3



Two styles of beet cultivators—different prices. Fully guaranteed.

evergreens for our part of California, even the native coniferous trees which abound in the forests, prove this.

Flower Borders

Considerable attention should be given to the flower borders, and much of the planting of perennials can be completed. If you are planning new borders secure those perennials which are useful for cutting and make your selection with a view to having plants which will give you bloom practically until the end of the season, and if you secure a few of each of the following and group them, placing the tallest in the background, you will have a delightful show throughout the year.

Aquilegia in varieties as follows: A. chrysantha, A. coerulea, A. Californica (a long spurred hybrid), Anchusa myosotidiflora, A. italica, "Dropmore variety". Anemone Pulsatilla, Dianthus barbatus mixed D. plumarius, Doronicum excelsum, Geum. coccineum, "Mrs. Bradshaw", Helenium Hoopesi, Heuchera sanguinea, Iris liberica Lychnis Chalcedonica, Paconia officinalis rosea fl. pl, Papaver nudicaule, P. orientale hybrids, phlox divaricata in varieties, Pentstemon "Newbury Gem", P. grandiflora, Primula veris, P. veris superba, Veronica spicata, Achillea "The Pearl", Campanula persicifolia, Althaea rosea (single and double), Digitalis gloxiniaeflora, Erigeron speciousus, Gaillardia, Kelway's hybrids, Gypsophila paniculata, Anthemis Kelwayi, Aster grandiflorus, A. cordafolia, Boltonia asteroides, Chelone glabra, Cimicifuga racemosa, Delphinium formosum, D. hybrids, Heliopsis Pitcheriana Eupatorium ageratoides, Linum perenne, Lavendula vera, Rudbeckia Newmanni, Statice latifolia, stokesi cyanea chrysanthemum maximum vars, Tritoma hybrids, Gerbera Jamesoni hybrids. Any vacant spaces in the border can later on be filled out with annuals.

Rockery—Suitable Plants.

If you can construct a small rock garden or have your paths edged with stones, plant the following between: Aubretia deltoides grandiflora, Arabis alpina, Alyssum saxatile fl. pl. and saxifraga sarmentosa.

Lawns

These should be top-dressed with well decayed cow manure. Those sown with Kentucky blue grass were almost ruined by the recent frosts.

February Planting Calendar for Southern California

Written for California Cultivator

IF the lawn has any Bermuda—and what lawn hasn't—it is probably one shade of brown. At this time of the year it may be quickly changed by a liberal application of commercial fertilizer. Give a good raking and apply a little complete fertilizer and more of fine ground bone meal. The warm days which will soon be here will quickly bring out the green. For those who have no Bermuda mixed with the blue grass, or rather for those where Bermuda is just encroaching, the next few months will be busy ones, that is if it is desired to give the blue grass an opportunity to show its greatest beauty. The continual raking and following after every indication of Bermuda helps wonderfully in keeping down this pest, but if one must put up with it reasonable care will make of it an attractive lawn and one which will stand almost unlimited abuse.

The lawn which is to be planted this spring should now receive attention. In hoeing kill out all weeds and level up surface in order to prepare a perfect seedbed. Have it ready by the end of February for the planting.

For some of the more tender plants it is perhaps a little early for planting but it is none too early to spade and improve soil conditions and have the ground in readiness for later planting. In more protected situations, however, and with the hardier plants, seed and bulbs may be planted at once. Gladiolus may be planted any time from now until June or even earlier.

Deciduous shrubs and trees should be pruned at once. It is a little late but it is barely possible that rose cuttings may be made and planted in sand or sandy loam. Vines, such as English Ivy, Virginia Creeper and others may be headed in or pruned at this time. In this connection we may remark that English Ivy makes a remarkably fine covering under trees or any place where blue grass or ordinary lawn will not grow. By a bit of clipping with sickle it may be kept fairly close to the ground and make of an unsightly place a beautiful spot.

For iris, daffodils, tulips, anemones, ranunculi, and other spring flowering bulbs a mulch of well-rotted manure is particularly acceptable at this season.

If there is a nook on the place where an abundance of water can not be given scatter a few seed of Shirley poppies, or in another section may be scattered seed of our native California poppy. They will make beauty spots three or four months later. It is of advantage to have these plants where they may be watered if possible for a drouth or lack of spring rains may cause them to dry off rather early in the season. They will stand neglect, however, if forced upon them.

The old-time friends, such as phlox, aster, zinnia, marigold, petunia and others, may be planted now. Later in the month will be an opportune time for putting back into the ground the tubers of dahlias. The dahlia is becoming such a favorite that the demand for the later improved varieties is almost equal to a boom.

Questions and Answers

ANSWERS BY EDITOR AND STAFF

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Preserving Citron

A subscriber writes but fails to give address, requesting formula for curing citron. We would refer the subscriber to the issue of the Cultivator of June 3, 1915, in which full information is given.

Name of Flowers

Please give names of flowers enclosed. One has a yellow flower, the other a pink, both the general form of a daisy.—Subscriber, Whittier.

The yellow flower is the African Daisy, Gazania Splendens, the other the New Zealand Daisy, Vittadinia Australis.

Reclamation Lands

Are there any lands in Southern California with irrigation under government management which a farmer

with small means may file upon?—Subscriber, Long Beach.

We believe there are no such lands in Southern California. There is only one reclamation project in Southern California and this is along the Colorado near Yuma, Arizona. All these lands have been filed upon. There are lands on the Arizona side, however, which will soon be open to entry. Information regarding these may be had by addressing "Manager Reclamation Project, Yuma, Arizona."

Poisoning Sparrows

Please give an efficient method of poisoning sparrows. Poisoned wheat does not seem to do the work and shooting is too expensive. They eat all the young plants in the flower garden and it is impossible to raise vegetables except under screen.—Subscriber.

In some sections the English sparrow has proved one of the worst of pests, but plainly our inquirer has evidence of this fact. Probably the best and surest way of destroying them is by means of the trap. Methods of making different types of traps are shown in "The English Sparrow as a Pest," Farmers' Bulletin 493, published by the United States department of agriculture, Washington, D. C. This same bulletin says: "Wheat has proved to be a good bait as well as an excellent vehicle for administering the drug. A convenient method of preparing poisoned bait is as follows: Put one-eighth ounce of pulverized strychnine into three-fourths of a gill of hot water, add one and a half teaspoons of starch or wheat flour moistened with a few drops of cold water, and heat, stirring constantly till the mixture thickens. Pour the hot poisoned starch over one quart of wheat and stir until every kernel is coated. Small-kerneled wheat sold as poultry food, if reasonably clean, is preferable to first-quality grain, being cheaper and more easily eaten by the sparrows. A two-quart glass fruit jar is a good vessel to mix in, as it is easily shaken and allows the condition of the contents to be seen. If the coated wheat be spread thinly on a hard, flat surface, it will be dry enough for use in a short time. It should be dried thoroughly if it is to be put into jars and kept for future use. Dishes employed in preparing poison may be safely cleansed by washing.

"Other seeds, as oats, hemp, or canary seed, may be used instead of wheat in the above formula, but they are less economical because much of the poison is lost when they are hulled, though enough of it usually sticks to the mouths of the sparrows to produce fatal effects. As wheat has no hull that a sparrow can remove it is ordinarily preferable to other seeds. Bread in thin slices spread with the strychnine-starch mixture may be used to advantage alternately with seeds."

We give this formula notwithstanding we note subscriber says "Wheat has not succeeded," but careful following of the formula given above may bring better success.

As to trapping and shooting, we may add that this pest offers a dainty dish for the table. Of course their bodies are very small, but where plentiful, and especially where caught in traps and fed well for a few days before killing, they make a satisfactory addition to the menu.

A most complete study of this pest is made and reported in Bulletin No. 1 of the Division of Economic Ornithology and Mammalogy, published by the department in 1889. We presume this is out of print.

Siphoning From Well

I propose to dig a well on the side hill and siphon water to tank below, using three-fourths inch pipe. How deep will a siphon work?—Subscriber, Los Gatos.

In theory a siphon will work to a depth of 33 feet; in practice 20 to 25 feet is the limit. We do not think this arrangement will be at all satisfactory. All water contains some air and practically all pipes will leak more air, and unless the pipe is absolutely air tight the siphon will work but a short time until the pumps have to be started again to extract the air and start the siphon. The more satisfactory way would be to tunnel instead of digging the well, then gravity cares for the flow permanently and economically.

Gummosis

Having been troubled with gummosis in my eight year old Valencia orchard last year I was planning to take precautionary measures this winter by thoroughly spraying the ground under the trees and also letting it flow copiously into the basin formed by digging the dirt away from the tree, with blue stone (one pound to the gallon), but have been told that it would be very injurious to the trees, even kill them. Not wishing to injure the trees I thought it best to get advice through your valuable paper. Also please tell me if bluestone alone is efficacious or if lime should be mixed with it.—Subscriber, Anaheim.

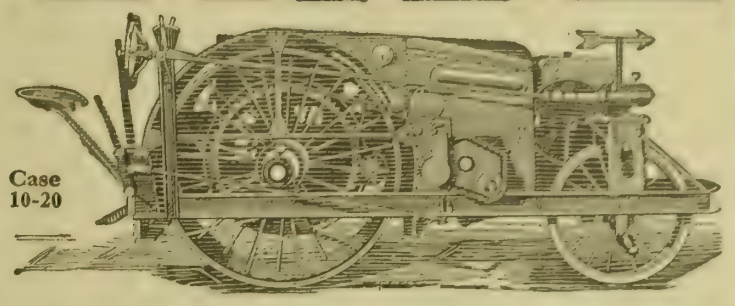
One should not allow copper sulphate solution in the strength referred to above in any quantity about the roots of trees. Prof. Fawcett in a former issue of the Cultivator gave the following instructions for cutting out diseased portions of tree and treating with Bordeaux paste:

"Use a sharp knife with a heavy blade. First determine to what extent the bark is killed to the wood in the vicinity of the exuding gum. Then cut all around the area about one-half to one inch into the live, unstained bark and a little farther at the top than at the sides, as the fungus usually extends faster upwards than in other directions. Then dissect out this entire area of bark that is killed to the wood and treat the wound and the entire trunk as well with Bordeaux paste. Experience seems to indicate that it is unnecessary to scrape the discolored wood.

"A good formula for a small quantity of Bordeaux paste is: One pound of blue stone (copper sulphate) dissolved in three quarts of water in a wooden, earthen or glass vessel; and two pounds unslaked lime slaked in three quarts of water in a separate vessel of any kind. When the lime is cool, stir the two together, making a slightly pasty light blue mixture. On a larger scale the formula would be 12 pounds of blue stone to eight gallons of water; and 24 pounds of lime to eight gallons of water. The blue stone is easiest dissolved by suspending it in a sack at the top of the water over night. If the blue stone is pulverized and suspended in warm water it dissolves rapidly. Good lime that is not air slaked should be used, and after slaking it with the water it should be allowed to cool before being used in making paste. If covered to avoid evaporation each ingredient will keep indefinitely, but after mixing the paste slowly deteriorates. Where it is being used over a number of days or weeks, just enough of the wet slaked lime and the blue stone solution should be mixed to make paste enough to last for one or two days, leaving the remainder unmixed in separate vessels. It may be applied with large brushes as is whitewash."

Continued on Page 142

CASE



Not Merely for Plowing

The Case 10-20 Tractor is adapted for all kinds of farm work. It pulls manure spreaders, harrows, planters, hay tools, harvesters, road-scrapers, etc. It will drive silo-fillers, threshers, balers, feed-mills, lime pulverizers and do many other belt jobs.

The Product of 75 Years' Experience

Because of this long experience in the manufacture of farm implements it is natural that Case products represent values that cannot be duplicated. The Case 10-20 weighs only 4800 lbs.—much less than other tractors of equal capacity. It has a four-cylinder Case-made motor which our experience has proved absolutely essential in any light tractor. The Case 10-20 tractor is designed with utmost simplicity and freedom from complicated parts. All parts of the motor are easily accessible, so no dismantling is necessary for any adjustment.

Designed and Built in Case Shops

Every Case tractor is designed and built by Case-trained workmen, right in Case shops. It is not bought piece by piece outside and assembled. This includes our specially designed tractor motor. We *know* that Case Tractors represent the best that experience, money, time and modern machinery can produce. That's why *every* Case product is backed by an absolute guarantee to perform as well, or better, than any other product of its kind.

All Case Products Lead

Case steam engines, Case threshing machines, Case road machinery are all leaders in their own field. Each one offers the utmost at a reasonable price, performance, reliability and service.

Write today for our complete Case catalog. It is an album of information that should be on the table in every farm sitting room. It is beautifully printed, with many interesting scenes and reproductions in color.

J. I. Case T. M. Co., Inc., 240 Erie St., Racine, Wis.
Founded 1842

There are five sizes of Case Tractors—the 9-18, 10-20, 12-25, 20-40, 30-60. A size for every farm.

Write TODAY for more information about the Case 10-20 tractor or whatever size you need.

Crop Rotation for the Sugar Beet Nematode

A ROTATION of four or five years is recommended by specialists in the United States department of agriculture as a means of controlling the sugar beet nematode, a pest which has been known to close a number of sugar beet factories in Europe and is already sufficiently prevalent in the United States to be a serious menace to the industry. The rotation should include beets or other suspected crops only once, and it is regarded as safer for the farmer to extend it to six years rather than to content himself with four or five years, the common European practice. In Farmers' Bulletin 772, "The Control of the Sugar Beet Nematode", a list of the crops suitable for such a rotation in the various sugar beet regions of this country is given.

Sugar beet nematodes are exceedingly fine, threadlike, colorless creatures, so small that, except under certain conditions, they can not be discovered by the naked eye. When they first hatch from the eggs they find their way to the nearest rootlet, force their way into it and proceed to feed upon the plant juices. This ultimately results in the production of a characteristic dense mass of rootlets, a condition which in Europe is described as "hunger roots," "bearded roots," "hairy roots," etc. In severe cases the beet itself is stunted and resembles the root of a celery plant. For this reason it is sometimes called "celery root."

The first evidence, however, of the trouble that is likely to be noticed by the farmer is the change in the foliage. Toward the end of July or early in August infested areas become lighter in tint, the leaves of the affected plants droop until they lie prone upon the ground and do not recover during the night. The outer leaves become yellowish, spotted, and generally discolored. Ultimately they wilt and die. The inner leaves fail to reach their normal size and may die as well. In severe cases the whole plant is destroyed and sharply defined bare spots are left in the beet fields.

The reduction in the crop caused by this pest is very great. The average weight of foliage of sugar beets infested with beet nematodes may fall as low as one-fifth that of healthy beets, and the average root weight suffers in proportion. Furthermore, the content of sugar is very materially reduced. Experiments have shown that an average of 14.9 per cent of sugar in healthy beets may be lowered to 8.4 per cent in badly infested stock.

Once the sugar beet root nematode has been introduced into a district it is easy for the pest to spread. Infested soil may be carried from one field to another in a number of ways, one of the most common being the waste water from sugar factories. Owing to the fact that the eggs are frequently preserved in a brown cyst, or sack, into which the female ultimately turns and which effectually protects them from the cold, they may continue in a dormant state for months or sometimes even years, and this obviously greatly facilitates the dissemination of the pest. For this and other reasons it is essential that a rotation of crops adopted to eliminate the nematode should be continued for five years or more.

In this bulletin the beet zone of the United States is divided into four groups. For California and Arizona rotation recommended is: Cowpeas, soy beans, sweet clover, rye, the millets, tomatoes, asparagus, lettuce, cantaloupes, strawberries, barley, corn, Lima beans, wheat.

Where only small areas are found infested the adoption of a crop rotation may be avoided by immediate action. A survey of suspected fields should be made as soon as the hot season has set in. Wherever wilting and yellowing of the leaves is noticed, the beets in this area and those for several feet around should be pulled and destroyed by covering with quick lime. A narrow trench about one foot deep should then be dug around the area and filled with unslaked lime. The ground inclosed by the trench must also be heavily spread with lime, which is thoroughly mixed with the soil. This mixing should be repeated frequently during the hot weather.

It has also been ascertained that even when protected by the brown cysts the beet nematodes can be destroyed by a brief exposure to a dry temperature of 145 degrees Fahrenheit. This does not injure but, on the other hand, improves the germinability of the seed to which the pests may be attached. It is therefore possible that such treatment of beet seed may be a wise precaution on the part of the farmer who fears the introduction of the nematode into his fields.

CATERPILLAR
Reg. U.S. Pat. Off.
Time is the test of a tractor:
—Time as demonstrating the experience of its manufacturers in tractor building.
—Time as measuring its length of life and service.
—Time as reckoning its working hours, unhindered by weather and soil conditions, or by delays for breakdowns or repairs.
Years of Caterpillar building—years of steam tractor building experience before that—have made Holt the world's best-known tractor manufacturer.
Thousands of owners in thirty countries testify to the length of the Caterpillar's life and service.
Lowest cost per working hour through continual operation and freedom from repairs is the secret of the Caterpillar's success.
We will gladly send you details on all models.

SUGAR BEET THRIPS

The sugar beet thrips is an imported insect recognized as a greenhouse pest and also injuring outdoor plants, principally sugar beets and sugar cane, according to the United States department of agriculture.

The insect is dark brown or black in color and about 1.3 millimeters in length. The injury caused is similar to that of other species such as the onion and bean thrips. The plant is attacked by adults and young in the same manner. The leaf cells are pierced and the plant juices withdrawn, causing the cells to shrivel and turn white. When a number of these cells are destroyed they appear as irregular white or light brown spots. If the attack is severe the whole leaf surface becomes invested by these spots and finally shrivels and dies.

Spraying Best Method of Control

Spraying has been found the most satisfactory and effective means of control of this insect. The following solution used in one experiment killed all adult insects and about 95 per cent of the young: Nicotine sulphate, 6 ounces; fish oil soap, 4 pounds; water, 50 gallons. Spray should be applied to both sides of the leaves; if possible on a dull or cloudy day. The adults are not so active at this time and are less likely to move out of reach of the spray.

RELATIVE TO GASOLINE

In a statement recently given out by the United States bureau of standards effort is made to correct two erroneous opinions generally held by the public regarding motor fuel. According to the report, specific gravity is practically worthless as a check on gasoline when it is desired to gauge its value for use in motor cars. Just what is the proper test is still a matter of some doubt, and in this regard the report states:

"It seems most probable that the definition of gasoline will have to be

based on the percentage that distils over between specified temperatures, when the distillation is carried out under specified conditions. This distillation test, speaking in non-technical terms, is a measure of the freedom with which the gasoline will vaporize. The gasoline must not vaporize too freely for two reasons—one that it would not be safe, and secondly, its loss in storage by evaporation would be too great. Hence, the specification may have to contain limitations of the percentage distilling below a certain temperature, coupled, perhaps, with a proviso that certain percentages shall distil below other fixed temperatures, in order that requisite amounts of low-boiling constituents shall be present to insure easy starting of an engine. Likewise the specification must contain a provision that all must distil over below a certain maximum temperature in order to exclude from the gasoline the heavier petroleum distillates, such as kerosene."

Resolutions of National Conference

RESOLUTIONS are not always effective in accomplishing all their words would indicate and too often their fine sentiments are not fully sustained by follow-up work on the part of the organization which fathered them. Again they are the outward manifestations of serious work being done by an earnest body of workers.

Here are resolutions which belong, we believe, in the latter class.

At the national conference on Farm Marketing and Rural Credits in Chicago Dr. Elwood Mead of California was made chairman of the committee on resolutions.

Resolutions indorsing rural credits and urging better marketing methods were passed. As to land colonization:

"If we are to have a scientific land settlement policy it should include the following features:

"Detailed soil and economic surveys of unsettled lands to determine the character of the soil, the need for drainage and irrigation and the kind of agriculture or horticulture best suited to the locality. The results of such surveys should be published as a guide to public and private enterprise in the preparation of plans for colonization and the disposal of land to settlers.

The adoption of a policy under which the federal or state government or the two cooperating, will provide "ready-made farms" that will be habitable and can be made immediately productive. We endorse plans similar to those formulated in the "Report on Land Settlement in Wyoming", which provides for cooperation between the federal and state authorities for the creation of settlements in which community as well as individual needs are cared for. This policy includes provision for town, schools, roads and the determination of the size of farms needed to furnish employment and give a living income to the settler. The Wyoming plan also provides homes for farm laborers which will give them economic independence through the ownership of sufficient land to enable the laborer's family to grow its own fruits and vegetables and keep a cow, pigs and poultry. The object of this is to enable settlers to earn a living income from the soil in less time and with smaller expenditure of money than is possible where each one works unaided and alone. Such expenditures or loans should be repaid by the settler with interest under such conditions and in such time as will permit the money to be earned out of the soil.

Such supervision of private colonization and the private sale of lands as shall prevent misrepresentation and fraud and aid the settler in selecting lands suited to his needs.

"The creation of institutions and the employment of competent farm advisers for beginners as will prevent costly mistakes and promote the spirit of agricultural cooperation, and of community rather than individual action.

"There is an evident need for the establishment of comprehensive, reliable and disinterested national agencies that will furnish: Information to would-be farmers, whether American born or immigrants from other countries. The opportunities for settlement in different sections of the country; and assistance in securing homes and becoming established comfortably upon the land.

"This conference again urges its recommendation of 1915 for the appointment of a federal commission having authority to employ a body of expert assistants to carry on inquiry in all parts of the country which will show: Methods and results of unregulated private settlement; the need for more favorable financial terms of purchase by tenants and would-be farmers of small capital; and the feasibility and value of adopting in this country some of the policies of other countries which have done so much to improve agricultural and social conditions in those countries."

Book Review

"JUDGING FARM ANIMALS"

Judging Farm Animals, by Charles S. Plumb, Professor of Animal Husbandry, Ohio State University, and author of "Types and Breeds of Farm Animals," published by Orange-Judd Company, New York.

With the interest in high school agricultural clubs and the growing appreciation of the need of better judgment in the selection of farm animals on the part of the farmer this book should meet with a hearty reception. It is written by one of the best authorities in animal husbandry, who says clearly what he wants to in good English. The book has many illustrations showing types of animals and making plain the text. The author says in the foreword:

"The study of animal form becomes an instinctive process on the part of most persons who take a natural interest in farm live stock. The form and its suitability for specific purposes is sure to cause discussion and argument, if but two parties are interested. Thus do men think themselves critics and judges of animals, even though their knowledge is based on very limited experience. There are men, however, who have grown up among flocks and herds, who, during the years, have absorbed wisdom through experience, and have naturally become qualified to judge the merits or demerits of certain kinds of animals with which they are familiar.

"Another class of men, lacking in experience, yet with the stockman's instincts, seek information that will enable them to judge animals intelligently, thereby better serving themselves and mankind. In the agricultural school or college, this latter class may secure systematic instruction relative to the principles and practices of judging, whereby they may become better qualified to pass on the comparative merits of farm animals."

There are 53 chapters and an appendix. Two chapters are devoted to form and function, then several chapters discuss the matter of judging the horse, others the judging of cattle, and still others sheep and swine. Every farmer who has to do with live stock will be interested and this book should be in his library.

Get this valuable free book

Do you own an orchard? Or are you going to plant one?

If so, you will find information worth many dollars to you in the Giant TREE BOOK, "Better Orchard Tillage." This book is written especially for Pacific Coast fruit growers. It tells how to have thriftier, faster-growing, earlier-bearing trees by planting in beds blasted with

GIANT FARM POWDERS
STUMPING — AGRICULTURAL

It tells also how to secure better drainage and increased moisture-storage capacity in established orchards, and how to get larger yields and save money on fertilizers.

The book contains illustrations that show exactly how to do the work. There are chapters on preparing the beds for trees and increasing the plant food by deep tillage. Also there are directions for blasting in established orchards or groves, and interesting letters from many prominent fruit growers.

Mail the Coupon

Mark and mail the coupon—or a post card—and this valuable book will be sent *free*. Do it *now*—before you forget it. Other illustrated books on Stump Blasting, Boulder Blasting, Subsoil Blasting and Ditching, will also be sent on request.

Worn Out Soils Made Productive

by using

Hauser's Organic Fertilizers

Science and practice both indicate that Nitrogen and Phosphoric Acid are necessary to produce the best results from the Citrus Orchards, and these two essentials are most prominent in organic fertilizer. Hauser's Organic Fertilizer is a concentrated soil builder and fruit producer. Put back into the soil at least a portion of the natural elements the orchard has taken out.

Home Products

Send for booklet "Good Reasons," tells you why "Natural Fertilizers" fertilize and return you many times the money spent for this unexcelled plant and tree food.

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertiser in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

THIS WEEK'S COVER

Time for plowing under cover crops will soon be here. Prof. Vaile's article on leader page is an excellent reminder, as is the photograph on the cover page. Many orchardists formerly "disked in" the cover crops, but more recently the conclusion has been reached that plowing under secures better action. The most important question, however, is not the one of detail, but of securing a heavy crop of vegetable matter to work into the soil.

SOME AUTOS

California has one automobile for every 12 persons within her boundaries. She almost leads the world, but because of big prices for wheat and other general farm products of Iowa her farmers have bought so many machines within the past year that that state has passed her. Iowa has an automobile for every 11.2 persons. During 1916 there was paid into the treasury of the state of California $2.-116,227.85 for licenses on 230,608 autos. New York, Ohio and Illinois all have a greater number of automobiles than has California, but they have not one-half the number per capita.

INCREASED PRODUCTION

Fertilizer companies and some farm organizations are appealing to the railway companies in consideration of the present dearth of transportation facilities to give shipments of fertilizer the right of way over other higher classed freight. Their appeal is addressed to the selfish interests of the railways—more fertilizer, more crops; more crops, more freight; more freight, more profit. In European countries fertilizer, at this period of the year when early arrival means successful and larger crops, is given right of way. The appeal is a reasonable one, for plentiful use of fertilizer means greater production, and greater production means cheaper crops.

BOOST YOUR BREED

Of all California boosters we think the Berkshire boosters boost their favorite hogs with greatest vigor. Not content with having far more Berkshires at the P. P. I. E. than any other breed, they organized at the time of the Exposition the Western Berkshire Congress. This congress has its membership in the Coast states and has been a strong factor in increasing the popularity of the Berkshire hog. At the last congress held in Sacramento at the time of the state fair plans were made for a spring congress at which there should be a sale of pure bred Berkshires. President Guilford and Secretary Steele are some workers, but not content with their own efforts have drawn into line Booster Frost of the Berkshire World. Not only a successful sale but a royal good time is promised to all who attend the congress at Davis.

MEALY BUG CONVENTION

The mealy bugs are not to hold the convention, but the hosticultural commissioners of Southern California are planning for action which might make such a convention wise. State Commissioner Hecke has called a meeting of all horticultural commissioners of Southern California at Riverside on February 6. It is to be hoped that plans for extermination, or at least for more effective control, of the mealy bug may be devised that day.

Mealy bugs were formerly considered a mild mannered sort of a pest, but years of inhabiting the citrus orchards of California have convinced them that climatic and other conditions are ripe for making themselves very much at home, hence they are becoming more of a menace than was dreamed possible a few years ago. Their natural enemies have been encouraged, sprays and double fumigation have been tried, and while millions have been slaughtered, other millions remain. More effective control methods must be devised. Strength to the arm of the commissioners.

GREATEST CITRUS CROP

According to figures secured by the Riverside Press the coming citrus crop will be the state's biggest. That paper estimates that during the present year Northern California will produce nearly 900 cars of oranges; Kern, Tulare and Fresno Counties, or rather Centrol California, will produce 5250 cars; Southern California, 37,000. Central California will produce about 185 cars of lemons, while Southern California will produce 7815. This makes a total of 51,150 carloads of citrus fruits, considerably more than any preceding year.

The largest orange producing district is Pomona, which will ship this year 4700 carloads. The second largest district is Redlands, 4150 cars. Riverside, formerly the queen of citrus producers, will send out 3400 carloads. The banner lemon producing section is Ventura County which it is estimated will ship about 1250 cars. As a county Riverside practically equals Ventura in lemon production, but the Press has divided citrus sections according to natural rather than county lines. The Riverside district will produce about 500 cars, while the Corona district, which is in Riverside County, will produce 780 cars.

LITTLE ECONOMIES

"On account of the war," string, as well as some other things, is high. A great deal of string is used in tying up Thompson Seedless and some other varieties of grapevines which are pruned long. Last week we were in some of the vineyards of Fresno County. In Mr. Roeding's vineyards we noted a little economy which might well be practiced in many sections. He had taken the ordinary fan palm leaves and shredded them into narrow strings, using them to the saving of many thousands of skeins or balls of expensive cord. On another place, that of the University of California, the Kearney vineyard, stacks of hay, green to the very roofpole, caused inquiry. Other stacks were pointed out which were covered with a thatch of fan palm leaves. The hay had been protected from the weather and came from the stack as fresh and green looking as when put in.

The Coachella Valley in Southern California is cutting out some of its date palm leaves and sending to Eastern centers where there is demand for them in certain Jewish rites. This last use of what might otherwise be a waste product is a special and most limited one; it merely illustrates how many things may be made to bring additional income to the producer.

BEST OF MUSIC

Today the home without an instrument to reproduce the voices of artists, the genius of musicians, is like a house without a library."

So speaks a New York daily paper. It is a good text for a sermon, and we may almost add it is a sermon in itself. Most modern farm homes have a telephone, electric lights, even an auto. The latter enables the family to attend entertainments and perhaps hear the best of music. Unfortunately, instead of leading in that direction at all times, it leads toward the cheapest of movies, which are anything but elevating. Good music is not so common as the cheap picture, but it may be, and, what is more, it may be in every home, and this through "canned music." There was a time when the "talking machine" in the neighborhood was an argument in favor of low rents, but the modern phonograph is a vastly different instrument, and today music, and we mean real music, of the highest quality, by the best artists in the world is possible in every home. The farm home should welcome this modern educator. A library of good records is as educational as a library of good books.

SELLING TO HOME FOLKS

For years the Cultivator has argued the use of home markets for our own home products, whether it be fresh fruits, nuts, cured fruits, canned fruits or other farm proudcts. As a rule the entire energies of the marketers have turned toward developing far away markets while home trade was neglected. The prune growers recently observed home prune week, the raisin men have encouraged local consumption, and now comes the Citrus Exchange with the announcement of a local agency in Los Angeles. That market has largely been supplied with culls. It is worthy a better grade of fruit and will use it. The Federated Women's Clubs and the Retail Grocers' Association have united with the Exchange to bring about this change.

Now if as much attention can be given to California orange and lemon consumers as to the Eastern why should not the consumption be far greater proportionately?

Agricultural Notes

Georgia employs practically all her able-bodied convicts in road building.

The allotment from the federal fund for 1917 road building in national forests in California is $140,988.

Increased interest in poultry raising is being taken in all parts of the Union of South Africa. There are now five government poultry experiment stations in the union. Imports of eggs are rapidly decreasing.

The Mediterranean fruit fly has been seriously destructive the past season in western Greece, especially to orange, tangerine, peach, pear and apple crops. Fruit infested largely drops to the ground before maturity.

A proprietor of summer hotels in Maine reports that out of 9181 guests at his hotels during the past season, only 1851 came by railroad; that is to say, more than four-fifths of all these travelers came in their own automobiles.

A bonus amounting to about 16 cents per bushel for wheat harvested in France will be paid for the 1917 and following crops in consequence of a bill just passed through the chamber of deputies—this to cut necessity for importations as much as possible.

A trial order of 40 American made agricultural tractors recently reached the Russian department of agriculture via Vladivostock. These have already been bought up by land owners, payments to be made in two years. The department has ordered another 100 of 8-10 and 60 horsepower.

In "The Fruit World of Australasia" we note: "California sends to Australian markets large shipments of dried apricots, which invariably sell at higher rates than the local article. The California article is no better than the Australian product, but the get-up of the package is far and away ahead of the Australian."

No final statement as to the outcome of the campaign against citrus canker can be expected within a period of at least two years is the opinion expressed by the secretary of agriculture in his annual report. The campaign, however, is progressing very satisfactorily in the commercially important orange and grapefruit regions of Florida.

The 12th Annual Australasian Conference of Fruit Growers met in Melbourne the first week in November. Delegates were present from New South Wales, Victoria, Tasmania, South Australia, and New Zealand. This is the first meeting of this body since the beginning of the war. Control of pests and marketing and shipping problems occupied most of the discussion time.

Cotton seed has vastly increased in value in recent years. The value of products made from seed grown in 1915 was nearly three and three-fourths times as great as the corresponding value for 1900; and during the same period the quantity of seed crushed increased by 74 per cent, although the amount produced was not much greater in the later year than in the earlier.

An insect destructive to the peach and kindred fruits has been discovered by the department of agriculture in the District of Columbia and its environs. In its adult form it is a brownish moth and in its larval stage a small white and pink canterpillar. It attacks both the tender shoots and fruit, causing serious losses. It has been found almost impossible to poison it.

Agricultural News Notes of the Pacific Coast

Northern California

Colusa County shipped out more than 50,000 hogs during 1916.

A farm loan association has been organized in Alturas, Modoc County.

Senator Duncan of Oroville has introduced a bill into the legislature for the control of the star thistle pest.

Grazing permits will be issued in the Stanislaus national forest for 19,000 head of cattle and horses, 9800 sheep and goats.

Members of the Placer County farm bureau are organizing a cooperative creamery. It will be owned by cattlemen and operated in Auburn.

A bill will be presented to the state legislature permitting rice growers to shoot birds at any time of the year when they are damaging their crops.

During the past year Novato, Marin County, shipped by rail over $115,000 worth of eggs. This amount does not include products sent out by auto truck.

Senator Benson of San Jose will introduce a bill into the legislature asking for an appropriation of $150,000 to establish a deciduous fruit experiment station.

Under the auspices of the Northern California Milk Producers' Association meetings will be held in Chico, Nord and Gridley the early part of February.

The rice mill at Biggs, Butte County, has been closed down owing to shortage of rice supply. The farmers are not disposed to let their rice go at the prevailing prices.

There will be a big irrigation rally at Paradise, Butte County, on the evening of February 3rd. There will be present speakers from other irrigation districts in the state.

A petition will soon be presented to the federal government asking construction of eight miles of wagon road through the Hoopa Indian Reservation and Klamath national forest.

At the recent meeting of the California Wool Growers' and Sheepmen's Association at the university farm at Davis a resolution was passed asking for a duty on wool for revenue.

The Anderson-Cottonwood Irrigation District is being gone over by the state engineering department. If the report of the state engineer is in accordance with that of the engineer of the district work on the project will be immediately begun.

Commercial and civic organizations of Yuba, Sutter, Colusa and Nevada Counties recently met at Yuba City and endorsed the proposed cross-counties highway connecting the four counties. The highway would run from Colusa to Nevada City.

Ray C. Hannan of Corning, Tehama County, writes that Beresford Brothers of Colusa have received drafts for the sum of $10,514 for their 1916 prune crop, which was taken from 1200 trees —about 14 acres—near the river. The weight tags, grade sheets, etc., are on evidence to prove the truth of the assertion.

The boundary between Shasta and Trinity Counties has been designated as the mountain divide between the counties. This is so indefinite that some property holders have felt it necessary to pay taxes in both counties in order to secure their titles. The present legislature will be asked to fix a definite boundary.

Central California

Turlock is asking for the next Stanislaus County fair.

The campaign is still on in Fresno for a county farm adviser.

Thirteen farm bureaus have been organized in Fresno County.

The Tulare irrigation district will hold election of officers February 7.

Madera will this fall hold its first county fair and live stock exposition.

A large acreage will be planted to prunes in the Poplar section of Tulare County.

West side settlers are complaining that cattle of the mountain ranges are overrunning their fields.

Sugar beet planting has commenced on over 1000 acres in the district about Livingston, Merced County.

Monterey is planning construction of an inner harbor to afford accommodation for increasing commerce.

The California Peach Growers' Association has decided to build a packing house and warehouse at Hanford.

Farm bureau locals are being organized in Merced County preparatory to securing appointment of farm adviser.

Cream checks paid to Kings County farmers during December of last year amounted to $30,000 more than in December of the previous year.

Practically all the orange packing houses in the Lindsay district have resumed operations. All of them are using separators to detect frosted fruit.

The Turlock Merchants' and Growers' Association will plant a big acreage to cantaloupes in that district. The association is now building packing sheds.

Many thousand head of sheep are shipped out of Visalia every week to San Francisco slaughter houses. The sheep are fattened on beet pulp and alfalfa.

Monterey and San Luis Obispo Counties hope to secure from the present legislature sufficient funds to build the coast highway from Monterey to San Luis Obispo.

The Reedley chamber of commerce has under consideration the building of a $20,000 peach packing house on the site of the old Madison-Bonheur packing house.

Grangers of Visalia, Poplar, Dinuba, Tulare and Alpaugh held a joint installation meeting at Visalia the middle of the month. All grangers report increase in membership during the past year.

J. W. Jeffrey of the state viticultural commission states that Eastern handlers of Emperor grapes find the drum pack unsatisfactory. Table grape growers met at Exeter Monday, January 22, to discuss this matter among others of importance to the industry.

Dr. Cady, the government expert who has been instructing swine growers in hog cholera treatment and prevention, is urging breeders generally to take care in local movements of swine, which he says are largely responsible for spread of the disease.

County Ground Squirrel Inspector Anderson of Fresno says that he will not permit ranchers to use poisoned wheat in killing ground squirrels. He says that barley holds the poison better so that it is not washed off by rains, also it is less readily eaten by birds.

Southern California

March 10 has been named as California Orange Day.

Frost damage to fruit in Ventura County is reported practically nil.

Riverside County has nearly 17,000 acres planted to oranges, nearly 3000 to lemons.

Growers of Arlington are interested in securing the establishment of a cannery in that city.

A local exchange of the California Citrus Growers' Association is being formed at Oxnard.

There was a canners' meeting at Ontario last week. Canners from all over the state attended.

Large quantities of jack rabbits are being secured in Antelope Valley and shipped into Los Angeles.

The Lemon Grove and Spring Valley Irrigation District will hold its annual election in El Cajon February 7.

The Garden Grove Bean Growers' Association recently held its annual meeting, re-electing all old officers.

Imperial Valley Malaga grape growers report sales of considerable acreages of these grapes at $40 a ton on the vine.

The Arlington Poultry Association is considering using auto trucks instead of express for taking their egg output to market.

Practically all the orange packing houses of Riverside County have installed water separators for eliminating frosted fruit.

A walnut pruning demonstration was recently held in the Puente district by an expert from the experiment station at Riverside.

The third Farmers' Free Auction Sale at Imperial was held January 27. Stock, produce and implements of all kinds were on sale.

The Garden Grove Citrus Association expects to enlarge its present equipment to handle next season's largely increased crop.

Half a dozen crate makers are busy hammering together lettuce crates in the warehouses at Brawley, getting ready for big shipments.

Lima bean growers of San Diego County met at Encinitas January 25 to form a local of the California Lima Bean Growers' Association.

Sugar beet growers of Southern California have formed an association. Temporary offices of the association have been opened in Los Angeles.

Supplies of lima beans on hand in warehouses January 1 totalled 513,925 sacks, as against 769,238 last year. Blackeyes this year total 139,641 sacks.

The Riverside County chamber of commerce at its recent meeting at Arlington recommended the securing of a farm adviser for Riverside County.

Fertilizer companies which are collecting kelp off the coast of San Diego County are reported to have "mowed" over 200,000 tons of seaweed last year.

A big addition is to be made to the packing house of the Sierra Madre-Lamanda Citrus Association. It is planned to handle from five to nine cars daily.

A mass meeting of citizens of Azusa, Glendora, San Dimas, Covina and Baldwin Park was held at Covina high school recently to discuss flood control plans.

The Coast

Seattle reports a pest of sparrows and robbins.

Eugene, Oregon, has organized a farm loan association.

Potato jobbers at Seattle are quoting Yakima Gems at $55 per ton.

The prune crop of Clark County, Washington, amounted to 7,500,000 pounds.

The Idaho State Seed Growers' Association recently held a convention at Pocatello.

Potato growers of Idaho organized a state association with A. H. Beasley of Idaho Falls, president.

The University of Arizona will conduct an extension school for farmers at San Simon February 17.

Cattle and horse growers of Idaho are working to establish a permanent live stock show at Lewiston.

The Arizona Cattle Growers' Association will convene at Globe March 5-17 for its annual meeting.

Idaho's output of alfalfa for 1916 was 888,000 tons, making it the heaviest alfalfa producer in the Northwest.

Spokane, Washington, is contemplating establishment of a city market on the site of the National Apple Show.

Bellingham, Washington, estimates some 300 carloads of potatoes still in that district, with a very firm market.

Wenatchee, Washington, will have a fruit by-products plant to manufacture cider vinegar, jellies and evaporated fruit.

Lakeview, Oregon, reports great activity in the wool and mutton market. Thirty cents is reported paid for large clips.

The state of Washington will spend nearly $10,000,000 on good roads the coming year according to figures of county engineers.

The farmers' union of Colfax, Washington, at its recent annual meeting elected F. B. Rogers, president, C. W. Perrine, secretary.

The Washington experiment station at Pullman has issued a bulletin giving soil survey of the proposed Palouse irrigation project.

The Idaho State Dairy Association recently held its annual meeting at Pocatello. The importance of testing cows was urged on attendants.

Spokane is going to try out four public markets on the school grounds in residence districts. No fees will be charged to farmers selling produce.

At the recent annual meeting of the Washington Wool Growers' Association K. O. Kohler of Ellensburg was elected president and Dr. Robert Prior, secretary.

The Egyptian Cotton Growers' Association of Chandler, Arizona, has elected G. R. Johnson president, P. M. James, secretary. This is a local of the central association which met in Tempe the middle of the month.

Utilization of fruit by-products is occupying much attention of Washington fruit growers. A by-products factory is in successful operation at Puyallup. Others are contemplated at North Yakima, Spokane, Hood River and Wenatchee.

The interstate commerce commission has ordered investigations of rates and regulations of the railroads in transportation of potatoes to Southern and Eastern points of the United States. This action was taken as a result of the petition of the Potato Association of America.

A Hog At His Best

He's never at his best if he's wormy. Neither is your other stock. Worms distress animals, retard thrift, bring on contagious diseases. Get rid of worms.

Dr. Hess Stock Tonic

Expels Worms **Makes Stock Healthy**

I tell you it pays to condition your stock now, in midwinter. Use Dr. Hess Stock Tonic and clean out their systems, purify the blood, then they will eat with a relish and digest their food. Buy it from the local dealer—the man you know in your town.

Why Pay Peddlers Twice My Price?

Costs you one-half less to buy and requires no more at a time to feed.

25-lb. Pail, $2.25; 100-lb. Sack, $7.00

Smaller packages as low as 65c.

My Guarantee

So sure am I that Dr. Hess Stock Tonic will positively rid your hogs of worms and keep your stock healthy and vigorous, that I have authorized my nearest dealer to supply you with enough for your stock, and if it does not do what I claim, return the empty packages and get your money back.

ABORTION IN CATTLE

PREVENTED AND CURED PERMANENTLY
YOUR COWS MADE PROMPT. REGULAR BREEDERS BY

STERILOID

STOP LOSING CALVES

TREATMENT: If STERILOID is used at the first sign of abortion the cow will go her full time and have a healthy calf. If your cows or heifers do not come in season, or fail to get with calf, use STERILOID. Cows get with calf after only one treatment. Write today for **FREE BOOK.** It explains the causes and symptoms of Abortion and tells how to cure Abortion, and make your cows regular, healthy breeders with STERILOID. Also contains letters from breeders who have used STERILOID successfully

GUARANTEE: We will refund money in every case when STERILOID FAILS to make good. Price $1.00. Mailed postpaid, in plain wrapper.

The California Swine Breeders Association

From Address By President C. B. Cunningham Before the Los Angeles Convention

THE swine industry in California for a number of years has not been much of a financial success. The producer has complained of prices received, often times selling for less than the cost of production; the buyers also have complained of the quality of the animals offered and that at even the prices paid there was no money in it for them. The consumer would not buy the finished product of our California raised hog, claiming that it was much inferior to the Eastern product. Something had to be done, for there is no reason why we cannot produce pork at a profit in this state, and why we cannot produce the quality as well. These were the causes that brought this association into existence.

The California Swine Breeders' Association was organized at the university farm at Davis on the 17th of April, 1913. At that time the California Live Stock Association existed, but as that organization was very large and embraced the horse, cattle and sheep interests of the state, it was thought advisable to form an association that would be comprised entirely of those who were interested in the production of swine. The initiative in this movement was taken by some of the professors stationed at the farm and Professor Thompson may rightly be termed the father of this association. Some thirty or more people met on that date and started this organization. In 1915 two meetings were held, both in San Francisco, at the exposition grounds; the first in April, the other in November. During the year just closed, 1916, three meetings have been held. The first at Sacramento in January; the next at Davis in May and the other at Hanford in October. In January, 1916, the first public auction sale of pure bred swine was held in Sacramento under the auspices of this association, and another held at Chico in May. We hope this year to hold five or more meetings in different parts of the state. Today our total membership is but little over 300. Every person who is interested in the swine industry of this state should be a member.

With a larger membership we can accomplish more; a body of men working along certain lines is reasonably certain of success where individual efforts often fail. This is the age of cooperation; we who are interested in the production of swine in this state want to make it a financial success. This association was not formed in the interest of any particular breed of swine, nor for the pure blood breeder. Its object is to promote the swine industry of this state in all its various channels, and this is of more interest to the producer of market hogs than to any other breeder. The slogan of this association is "More and Better Hogs in California". I believe that if it read "Better and More Hogs" it would be more desirable. We must have better hogs first and then after we get better foundation stock we will raise more of the better kind and be in a position to ask for better prices.

It is claimed that something like $30,000,000 is sent out of California every year for meat products. Just stop and realize what that amount would mean if it was spent in this state. What it would mean to every line of business operating in this state. Why should California be an importer? There is absolutely no reason why we should not only produce all we can consume but export as well.

California has had four well known historical eras. The first under Mexican rule as a cattle country, exporting quantities of hides, horns and tallow; next as the great gold producer; again as the great wheat state; today the fruit industry overtops all—but with our wonderful climate and natural resources and thousands of untilled acres, California is going to be known as the great live stock and dairy state and the hog will have a very prominent place therein.

The Swine Breeders in Los Angeles

Written for California Cultivator By J. L. Thatcher

IN writing of the recent meeting of the California swine breeders in Los Angeles one is under the unusual necessity of moderating his statements lest he be charged with exaggeration or at least with overmuch enthusiasm. I have been present at various national, state and breed association meetings from one end of the country to the other, yet I have never attended a swine breeders' meeting where I felt that as much definite good for the swine producing industry was accomplished as was achieved at the Los Angeles meeting.

Aside from the benefit that is always gained when a bunch of live stock men get together to talk things over, and the educational worth of the discussions that take place at such conventions—and there were some mighty good papers and discussions at that meeting—the really great result achieved at Los Angeles was the bringing together of swine breeders and packers. In fact, it was not just a swine breeders' meeting; it was a meeting of both swine breeders and packers, with both elements active participants in the work of the convention, and all striving for the betterment of the swine business on the Coast and the production of more and better hogs.

Swine breeders' meetings are ordinarily just gatherings of hog men for the purpose of discussing problems connected with the breeding, feeding, and management of hogs, and other topics intimate with swine raising, but this meeting of the California Swine Breeders' Association went infinitely beyond the ordinary in that it included in the program consideration and the discussion by packers of the all important subject of the selling price of hogs on the market and the factors which enter into the determination of whether those prices for pork hogs in California shall be high or low and consistent with the prices prevailing in other sections of the United States.

The men in charge of the program and arrangements for this meeting are to be complimented and congratulated for their farsightedness in thus bringing together the breeders and packers of the state.

That there is a decided movement toward improved methods of feeding and handling hogs and the raising of better and more hogs in California no one who is conversant with the facts will deny. Yet will those better hogs, hogs of better quality and properly fed and finished demand more on the market than will poorly fed and poorly finished stuff and get the recognition from packers which they merit and bring to the producer prices which will warrant swine breeders in raising not only the right kind of stock but giving that stock the kind of feed and care that are essential in the production of the highest grade of market hogs?

That question was answered definitely in the affirmative and by the packers themselves.

While the details of the plan have as yet to be worked out, and there are numerous factors to be considered, this definite result was accomplished at the Los Angeles meeting that the future price of hogs will be determined by the worth of the animals themselves, that is on a killing or per cent basis.

Whether the killing per cent on which the market price of hogs is based shall be 74, 75, or 76 per cent is yet to be determined. But this conclusion was reached, that hogs which dress out above the base per cent will demand a premium for every point above that base per cent, and those hogs which dress out below the base per cent will be cut in price for every point they fall below that line.

This is decidedly as it should be and will prove a greater factor in the promotion of the swine producing industry in California than any other thing that could have been achieved. The fact that properly fed and properly finished hogs will bring premium prices on the market will do more for the establishment of better feeding methods than all the talks and discussions one can listen to. It is the returns that count.

The Western Berkshire Congress Meeting

THE forming of the Western Berkshire Congress organization was a step in the right direction, and it is unique with breeders of Berkshire swine. The so-called "congress" is in reality a "get together" meeting, a place where brother breeders may meet and discuss the problems that confront the industry.

The annual meeting of this association will be held at Davis, February 13, 14 and 15. The university has offered the very best of facilities for holding the meeting. Some of the broadest and most able men in American agricultural educational work are connected with this institution, and everything is being done to make this meeting of real benefit to the live stock interests of the West. Every farmer and breeder of live stock in the United States is invited to attend these meetings.

At most such conventions, long and some times uninteresting papers are read which bring out long non-essential discussions, but the program committee of this meeting has done away with all such trite performances. The plans do not include any set program, but the whole meeting from first to last is to be one big informal discussion and Berkshire love feast.

During the evening of February 13 the barrows that the university authorities will select from a carcass demonstration will be judged and discussed. Arrangements are being made for a man of national reputation as a butcher to give this demonstration and later cut up the carcasses. The finished hog for market purposes is the ultimate aim of all swine breeding operations. So we think it very proper that the meeting should open with a discussion of this fundamental proposition.

In the evening a business meeting will be held, at which officers will be elected for the coming year. The following day, February 15, there will be a students' judging contest which will be participated in by several hundred students. This contest will be particularly instructive and interesting.

In the afternoon will be one of the big events of the entire meeting, the ladies' judging contest. There are a great many good judges among the wives and daughters of the Berkshire breeders of the West, and there will be some 30 handsome silver trophies awarded as prizes. The trophies will be silver water pitchers, beautifully engraved, so that they will be useful as well as ornamental.

In the evening there will be a banquet and love feast. This will be a grand event, and one that no one can afford to miss.

All of the third day will be devoted to a public sale, which is in complete charge of L. E. Frost, editor of the Berkshire World. Mr. Frost has had many years' experience in handling public sales, and everything will be done to make this sale a successful one.

The sale deserves particular mention, for at this time 40 or 50 head of the choicest animals from prominent Western herds will be offered. A secret meeting will be appointed to pass on all animals before going into the sale. If in the judgment of the committee the animals are not representative of the breed or are not such as should go into other hands as breeding animals, they will be excluded from the sale. This assures the high quality of the offering. This sale will begin at 12:30. The morning will be devoted to inspecting and discussing the sale offering.

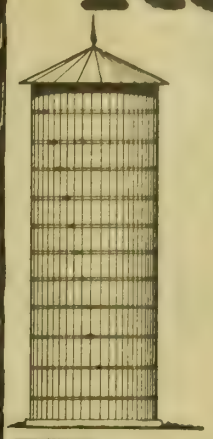
Mark these dates on your calendar now, February 13, 14 and 15.

"INTERNATIONAL 1916"

Messrs. Clay, Robinson & Co., Chicago commission men who broke the world's record in the sale of California Favorite for $175 per hundredweight, have issued "The International 1916", a magnificent brochure illustrated with some of the fat stock scenes taken at the International. Of course California Favorite is there, as is University of California Jock. One feature of the book is account of sale rendered to the University of California showing $1960, less $1.00 commission, paid to the university. One page is devoted to the agricultural college exhibit for which Clay, Robinson & Co. donated $1000 and in which the University of California in competition with seven other universities won almost a third. Regarding this the booklet says:

"In the class for two-year-olds the Angus, California Jock, exhibited by the University of California, won out against a very considerable field, second honors going to Iowa State College and third to Purdue University. In the yearling class a youngster shown by Iowa and bearing the great

Remco

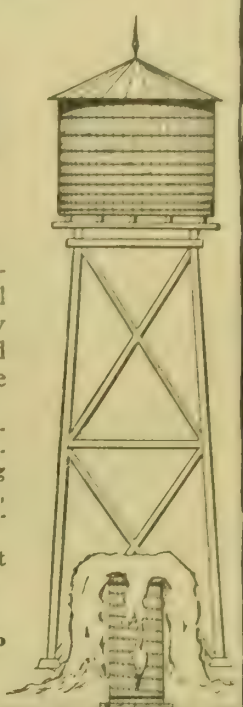


SILOS

For dairymen, farmers, feeders in all sizes and proportions.

TANKS

For water, wine, oil, vinegar, acids for storage, mixing, fermenting, pickling.



PIPE

For irrigation, power, water supply, in all diameters and for all pressures. Costs less than any other pipe of equal efficiency and endurance. Outlasts any pipe except cast iron.

All Remco products are manufactured to your order from clear, air-dried redwood. Their outstanding features are highest grade material, superior efficiency, maximum durability, true economy.

name of Carranza carried off first honors with quite a number of Villistas against him. In the calf class California Favorite was the natural victor, as also, of course, champion steer. In the class consisting of best five head the Kansas College won out, with Iowa such a good second we created a premium of $50 for it not in the catalog. Senor Duggan awarded the ribbons.

"The California College was also very successful with its sheep exhibit, having best wether (Wisconsin, second), best wether lamb (Ohio, second, Wisconsin, third), champion wether and best pen of five wethers. David Mackay awarded these premiums.

"Missouri showed the best barrow of the class, while for the best general exhibit of cattle, hogs and sheep—five of each—first honors went to Illinois and second to Kansas."

ARIZONA COMMISSION OF HORTICULTURE

It was our pleasure to meet at the recent State Swine Growers' Convention in Los Angeles Mr. Andrew Kimball, chairman of the Arizona commission of agriculture and horticulture. He was in California making notes and gathering information as to agriculture, and especially live stock conditions here, coming as an affiliating delegate to the state convention. Mr. Kimball said: "Reports and circulars concerning insect pests and means for their control are published from time to time. These may be obtained free of charge. For information and advice concerning insect pests and plant diseases address State Entomologist, Phoenix, Arizona. Whenever practicable, the commission, upon request, will arrange for institutes in agricultural districts in order to promote the agricultural and horticultural interests of the state. Correspondence concerning this matter should be addressed to the Chairman of the Commission, Thatcher, Arizona."

Goldie Nehalem Beauty, a three-year-old Jersey, owned by C. F. Reid of Portland, Oregon, has suddenly leaped into fame by acquiring the title of "Junior champion three-year-old Jersey". In a 365-day test, conducted under Register of Merit rules and supervised by the Oregon Agricultural College, she produced 12,367.7 pounds of milk and 750.51 pounds of butterfat. The new record exceeds that of Lass 74th of Hood Farm, the former title holder, by four pounds of butterfat.

GET A SHETLAND PONY FOR YOUR BOY OR GIRL

Boys and girls who would like to own a Shetland pony should send their names and addresses to the Pony Man, California Cultivator, 115-117 North Broadway, Los Angeles. We give away Shetland ponies to boys and girls, and if you will turn to the page in this paper with the pictures of the ponies you can see the pictures of some of the fine ones we have already given away and read the letters from those who have received them.

There isn't a nicer pet or playmate in the world for a youngster than a Shetland pony like these we give away. By nature these small horses are gentle and kind and are just the right size for boys and girls to ride and drive to school and to play with.

In the past three years the Pony Man has given away over 100 Shetland ponies to children for doing a little easy work that can be done during spare time. Send in your name and address on the blank printed with the pony pictures and we will write and send you more pictures and copies of many more letters and tell you all about it.

We ship these ponies in crates made especially to send ponies by express, and each pony is thoroughly broken to ride and drive and is perfectly safe for children to handle. Many boys and girls who have to walk to school have gotten our Shetland ponies so they could ride or drive.

Genuine Shetlands like these we give away are valuable animals and riding and driving them is the best

you do. One boy or girl has an equal opportunity with every other. We had never heard of any of these other boys or girls who got our ponies until they sent us their names and addresses. This places you under no obligation to us whatever, and if after you read all about it, you do not care to go ahead you can drop it entirely. You do not even have to be a subscriber to California Cultivator.

Veterinary

Answers in this column by Dr. Wm. Petrie, 2714 South Harvard Blvd., Los Angeles, are without charge. For immediate mail answer remit $1.00. In writing questions give full symptoms or particulars of injury of animal.

Unsigned communications receive no attention.

Worms

Please tell me what to do for a six-year-old horse that has intestinal worms. I noticed them last spring and gave him several different kinds of powders and had him at a veterinary hospital for a week, but still he passes a few worms. The horse has an awful appetite, eats anything and is in poor condition. The feed does not seem to do him any good. There is gas in his stomach as I can see it roll in his side, and his passages are loose and watery.—Subscriber, Orange.

You did not state the size of the worms, but we take it for granted they are stomach worms. Get eight ounces of tincture of iron. Twice a week make a bran mash by filling a clean bucket half full of coarse bran. Wet this with boiling water, cover it up and let it cool. When cool add a handful of salt and one ounce of the tincture of iron. Stir it well and let the horse eat it. Also get some good wood ashes, mix it with twice its weight of salt and give a large tablespoon of this in the feed once a day for two or three weeks. A little of the salt and ashes occasionally will probably keep him free from the worms.

Time For a Horse to Eat

What length of time should a horse have to eat his meals morning, noon and night, when not working?—Subscriber, Orange.

The horse should have all the time he wants to eat, and the longer time he takes the better. The horse's feed should not be regulated by his time of eating, but he should be given the right amount and then the slower he eats it the better. Food well masticated and well mixed with saliva will digest much easier and much more nourishment will be gotten out of it. Properly fed the horse should be able to eat his morning and noon meals in half an hour and then if going to work should have as much more time for rest before starting out. At night, when he should be given his largest meal, he should be able to clean it all up in two hours or less.

Locomotor Ataxia

Reporting again on the case of locomotor ataxia that you prescribed for in the Cultivator of January 13 will say that the prescriptions were filled and the medicine all given as directed, but so far can see no improvement in the horse. In fact he is not so well as he was, which may be due to the cold, wet weather. He seems to feel fine but staggers and can not control his limbs. One time when taking him out for exercise he scared at an automobile and fell very hard. We had some trouble getting him up and some difficulty keeping him on his feet after he was up. When taking him out for exercise we can only walk him a few steps at a time and then stop so he can get control of himself. When he falls he goes down like a ton of brick. One of the doctors who treated him for a while gave him half grain of strychnia once a day and he seemed to improve some on that. What do you think we had better do with him?—Subscriber, Charter Oak.

We are more than ever inclined to think that the trouble was started from a hard fall and that there is some pressure on the spine from the injury. Every fall he gets now only retards the healing. Try this as it will probably absorb any congestion that may be affecting the spine: Iodide of potash four ounces, strychnia sulphate 25 grains and water to make one quart. Give a large tablespoon of the solution in the feed twice a day.

Contagious Abortion

A neighbor has abortion among his herd of cows and our 15-months-old bull has, on several occasions, gotten in with those cows. I am not positive that the bull has served any of them. Now in your opinion do you think the bull is liable to carry the disease, and is there any way to prevent it?—Subscriber, Orland.

Yes, there is some danger of the bull carrying the contagion. Clip the hair off his belly and wash it well with soap and warm water with some carbolic acid in it. Also inject the sheath with a warm solution of permanganate of potash; ten grains to the pint of water. This will probably stop all the germs.

CLEANING MILK VESSELS

The first important rule to observe in cleaning dairy utensils is to rinse them immediately after use. This prevents the water in the milk from evaporating and the solid matter sticking to the utensils. If it is impossible to wash the utensils at once rinse them in cold or lukewarm water so that the most of the milk will be removed before it has a chance to stick. Hot water should not be used until the milky substances have been removed with cold or lukewarm water, for the hot water will coagulate the casein in the milk so that it will stick to the tin and require a greater amount of washing before it can be removed.

The Tagus Ranch has contracted with a Los Angeles packer to feed and ship fancy beeves. Their great herd of Aberdeen-Angus cattle is being brought to its highest efficiency. Mr. Merritt made a ten strike when he secured one of the men from Davis that assisted Alex MacDonald to fit the university steers which won so many honors at the Chicago International show in December. A large part of the beef that will be sent to market will be of the "Baby" variety and it will bring a premium over the market. The Tagus people are planning a number of improvements which when completed will place this ranch in the highest rank.

Arlington M. Smith has recently added to his Normandy Farms Berkshire herd three sows from H. L. and E. H. Murphy, three gilts from Chas. M. Talmadge, Washington, one gilt from the university farm, one gilt from F. R. Steel, Oregon, and two gilts from A. B. Humphrey.

Carruthers Farms First Annual Sale of
SHORTHORN CATTLE
will be held at the farms near
MAYFIELD, May 2nd, 1917

The Bulls:

20 Bull calves of rare Scotch breeding will be sold in the sale, two of them sired by Count Avon, the sire of our herd bull, Count Glory; there will also be six sons of Mayflower Sultan—everyone a good one: the balance are young bulls from sires of a national name.

The Females:

35 head will be sold, among them some of the greatest cows of the breed, rich in Crookshank blood; some of the tops will be in calf to Count Glory, California State Fair Grand Champion 1916; there will be two heifers sired by Count Avon, the sire of Count Glory; several heifers sired by Mayflower Sultan; eight cows in calf to Count Glory —all of them being of the rarest breeding. In this sale will be sold more Crookshank cattle than has ever been sold in a sale in the West. Make arrangements to attend the sale, and look over this great lot of Shorthorn cattle.

ALPHA AUTOMATIC HIGH PRESSURE POWER SPRAYERS
Drive the Solution into the Trees Under a Uniform Heavy Pressure

The satisfactory results obtained with either the Alpha Triplex or Alpha Duplex outfits are due primarily to the following unquestionable superior features of the Alpha Sprayers:

The Automatic Pressure Governor

which insures safety, secures uniform pressure, and eliminates unnecessary wear and strain on both pump and engine. No troublesome relief valves or diaphram pressure regulators are required on Alpha Sprayers. No liquid is pumped except it is forced through the nozzles.

The Perfect Power Plant

The Alpha Gasoline and Distillate Engine which is directly geared to the pump is a thoroughly first class machine. Built to stand up under continuous full load. Equipped with built-in, gear-driven magneto. No batteries required. Starts on the magneto without cranking.

You can equip the power sprayer you now have with an up-to-date reliable Alpha Engine. Write us for Special Engine catalog.

The Alpha Re-filler; the Flexible Suction Pipe connection between Supply Tank and Pump; the sturdy steel frame construction and accessibility of Alpha Sprayers are details which would be decidedly to your interest to investigate before buying any spraying equipment.

For full particulars and name of nearest dealer, fill in and mail the coupon.

Whey Separators Save Butterfat

California cheesemakers are wasting or feeding to hogs thousands of pounds of butterfat worth about 30 cents per pound. This was demonstrated to the cheesemakers by the University of California during the two-weeks cheesemakers' course held at the University Farm at Davis.

Through the courtesy of various separator companies whey separators were installed for this course. Much interest was taken in the operation of these machines, and those in attendance returned to their cheese factories with a good impression of the value of the whey separator. With conservative tests for whey, one should recover two pounds of butterfat for every 1000 pounds of whey when making Cheddar cheese, and 2.8 pounds when making California (granular) cheese. Assuming that a factory has 5000 pounds of whey, the fat recovered would be 10 pounds when making Cheddar, and 12 pounds when making California (granular). At 30 cents per pound, this fat would be worth $3.00 and $3.50 respectively. Under these conditions the average cost of operating the separator, depreciation and interest on the investment would be about $1.00 per day. This leaves a net of $2.00 per day when Cheddar cheese is made and $2.50 per day when California (granular) is made.

Disregarding the feeding value of the butterfat, the whey separator, under these conditions, would pay for itself in 115 to 150 days.

Cause of Bitter Cream

Bitterness in cream and milk is a frequent trouble during winter months. Percy Werner, Jr., of the Missouri college of agriculture, attributes it to the following causes: If milk is bitter when it is drawn, the trouble is with the cow or her feed. Very often cows give bitter milk toward the close of their lactation period. The old dry weeds of winter pasture also give rise to a bitter flavor in milk. The remedy in this case is to keep the cow from such pastures.

However, if the bitterness develops after the milk is drawn, which is most often the case in winter, it is due to the growth in it of a certain variety of bacteria. These bacteria get into the milk usually from pieces of dirt or manure from the barn. At low temperatures they will develop a bitter flavor before the milk or cream sours. When the dairy is once infested with such bacteria they may remain in the separator, pails, strainers or cooling tank for a long time. To prevent bitterness due to this cause, these bacteria must be eliminated. This means that all utensils, separator parts, strainers and cooling tank must be thoroughly washed and scalded. All dirt should be kept out of the pail at milking time by keeping the can clean and using a pail with a small opening.

While making such a clean up the trouble might be prevented by adding some sour milk to the cream as soon as separated and keeping it in a warm place until the batch is sour. Then it can be cooled and kept till churning time. Sour cream seldom turns bitter unless kept several days.

A Magnificent Bull

Prince Gelsche Walker 81663, the $12,500 herd sire at Santa Anita Ranch. A wonderfully bred bull that transmits high production to his heifers. At five years of age he has already 21 A.R.O. daughters, including several state and one world's record holder.

And Now the 50-Pound Cow

Official notification of the new world's champion dairy cow for butterfat production over a period of seven days has just been received in the Cultivator office from Superintendent Malcolm H. Gardner of the Holstein Friesian advanced registry. The name of this wonderful cow is Segis Fayne Johanna 114658. In seven consecutive days she produced 722 pounds milk and 40.544 pounds fat. She freshened at the age of eight years, two months. 17 days. Her sire is King Fayne Segis 46767; her dam, Vikina Johanna 64385. She was bred by A. A. Cortelyou of Somerville, New Jersey, and she is now owned by Oliver Cababa, Jr., Elma Center, New York. In the full age class of the seven day division she displaces Hester Aaltje Korndyke 133222, whose record for seven days is 621.1 pounds milk containing 37.429 pounds fat. The production of Segis Fayne Johanna's last seven full days as reported to the superintendent's office are as follows: 97.9 pounds milk. 5.666 pounds fat; 101.3 pounds milk. 6.052 pounds fat; 104.1 pounds milk, 5.466 pounds fat; 105.2 pounds milk, 5.759 pounds fat; 104.4 pounds milk, 5.743 pounds fat; 105.01 pounds milk, 5.785 pounds fat; 104.5 pounds milk, 5.766 pounds fat. The 40.544 pounds fat, so far reported for Segis Fayne Johanna but not exactly covering the days whose productions are given, computed on the 80 per cent basis would be equivalent to 50.68 pounds butter.

THE BEST LINIMENT
OR PAIN KILLER FOR THE HUMAN BODY

Gombault's
Caustic Balsam
IT HAS NO EQUAL

For the Human Body —It is penetrating, soothing and healing, and for all Old Sores, Bruises, or Wounds, Felons, Exterior Cancers, Boils Corns and Bunions CAUSTIC BALSAM has no equal as a Liniment.

We would say to all who buy it that it does not contain a particle of poisonous substance and therefore no harm can result from its external use. Persistent, thorough use will cure many old or chronic ailments and it can be used on any case that requires an outward application with perfect safety.

Here's Where it Tells-

It isn't a question of sentiment whether or not your cows are in the pink of condition—but it does make a big difference in your bank account. Since you are keeping cows for milk instead of for meat, better see to it that their milk-producing organs are kept working normally.

At the first sign of decreasing milk-flow, look for the cause. Ten to one it is due to some trouble with the digestive or genital organs, and such disorders are best set right by the use of Kow-Kure, a cow medicine backed by twenty years of success. Try Kow-Kure on your poor milkers and watch results. Hundreds of doubting cow owners have been convinced that this old remedy has no equal for the prevention and cure of Abortion, Barrenness, Retained Afterbirth, Milk Fever, Lost Appetite, Scouring, Bunches, etc.

Buy Kow-Kure from your feed dealer or druggist; 50c. and $1.00.

Write for our free treatise, "The Home Cow Doctor"

Feeding Test to Fatten Old Ewes

A feeding test in fattening old ewes for the market has just been completed at the University of California farm at Davis. The objects were first to ascertain practicability of fattening old ewes, value of silage and dried beet pulp. Four hundred and twenty-four ewes had been purchased from the Capay Valley Sheep and Land Company at Woodland at $5.25 each. They were of straight Merino breeding with a six-months fleece and from five to eight years of age, most of them showing a badly broken mouth. They were divided into two lots of 212 each, the following rations being fed: Lot I—Silage, dried beet pulp, and alfalfa hay; Lot II—silage and alfalfa hay. They were fed all the silage and hay they would consume, while the beet pulp was limited to a half pound per sheep per day. Feterita silage of good quality was fed the first three weeks, then Sudan grass silage for three weeks, and after this was all used up the test was finished on sweet sorghum silage. The feeding was done in open yards until the rain set in, when the sheep were given shelter. The sheep were put on feed October 3 and at the end of 44 days feeding, the bunch was topped, marketing 110 head of Lot I and 100 head of Lot II. The sheep were sold to the Western Meat Company, San Francisco, at 6.5 cents per pound, delivered. The following table shows the results:

Period I—44 days	Lot I.	Lot II.
Number of sheep	208	212
Av. wt. at beginning	95.7 lbs.	95.8 lbs.
Av. wt. at close	104.4 lbs.	101.5 lbs.
Average gain	8.7 lbs.	5.7 lbs.

Cost of Silage---Beef Production

The following in reply to a question as to the cost of silage for beef production was written by a silage expert of the De Laval Dairy Supply Co.

The cost of making silage exclusive of growing the crop will run from 50c to $1.00 per ton, depending upon the length of haul, the weight of the crop and other factors, and particularly the skill with which the teams and labor are arranged. The cost of making silage on the ranch of Col. Bugbee of Clarendon, Texas, was approximately $2.00 per ton. This included the growing of the crop and putting it into the silo. Other parties estimate that the raising, gathering of the crop, together with the depreciation in the equipment, will still enable the production of silage as low as $1.50 per ton. It is certain that the cost may be safely placed at right around $2.00 per ton. Now, comparison with the estimated value of silage as placed upon it by various of the experiment stations, will disclose the fact that it is worth for feeding purposes to beef stock approximately three times its cost of production.

Feeding experiments on beef production at the Iowa experiment station during 1911-12 on two-year-old steers showed silage at $3.20 per ton to be the equal to clover hay at $7.65 per ton. It is estimated that ordinarily when alfalfa hay is worth from $12 to $15 per ton for beef production, silage is worth from $5 to $6.25, which is, as stated, approximately three times its cost of production.

We are confident if you can go to the cattlemen of your section and get a hearing from them to the extent that they will thoroughly investigate the advantages to them of feeding silage, that it will result in many of them making provision for silage sufficient to carry on their feeding operations during the winter months.

There is one more suggestion that we have to offer and it is being worked out by several of the large cattlemen of the Pacific Coast today, and that is, providing silage for the calves at weaning time. It is the plan of several to have silage ready to feed to their calves at weaning time, and in that manner prevent the shrinkage that always occurs because of the calf being weaned at a period of the year when feed is mighty short.

One large rancher in San Luis Obispo County told the writer recently that by feeding his calves silage at weaning time, his steers were the equal at two years of others at three years that had been left to shift for themselves. In other words they had gained a year by feeding silage at the right time.

HOW BIG A SILO SHALL YOU BUILD?

The following table gives capacities of round silos of various heights and diameters. In figuring capacity of silo needed 40 pounds of silage per day is the average allowed for each head of cattle. This table was prepared by A. L. Paschall, farm adviser of Cochise and Santa Cruz Counties, Arizona.

Capacity of Round Silos in Tons

Inside Hgt. of Silos	Inside Diameter in Feet 8	10	11	12	13	14	15	16
20	17	26	30	38	44	51	59	67
21	18	28	33	41	47	55	63	72
22	19	30	36	43	50	59	67	77

30	30	47	65	67	79	91	105	119

Frampton Bros., Artesia, purchased one of the best bred and best individual young bulls in the Morris herd at Woodland a few weeks ago. His name is Segis Pontiac De Kol Burke Clyde, calved April 1, 1916. He is out of a son of the great Riverside Sadie De Kol Burke, and his dam, Diotime Clyde Korndyke 152262, has a record of 31.91 pounds butter, 641.21 pounds milk in seven days. She is a four per cent butterfat cow and is now in the Santa Anita herd. Her sire, Korndyke Queen De Kols Prince, has 88 A.R.O. daughters, five of them over 30 pounds butter in seven days. This young bull will be used in the Frampton herd and probably shown at some of the fairs this fall.

E. O. McClure, formerly located at Modesto, recently transferred his fine herd of Holsteins to Santa Ana. Mr. McClure has been collecting a splendid lot of A.R.O. cows, headed by a son of King Segis, King Pontiac Netherland Segis. The cows have records running from 15 to 28 pounds butter in seven days. Mr. McClure purchased what was known as the Moreland ranch, which had the reputation of being the largest and best equipped dairy in Orange County. Many of the buildings are of concrete construction.

When the Swine Growers' convention had adjourned last week the Poland-China breeders present got together and discussed the question of organizing a state wide association which would absorb all the existing minor associations, such as North San Joaquin Valley Association, Kings County Association, etc. This is a move which all the other live stock associations will eventually make, as the old maxim, "In unity there is strength", applies particularly to the stockmen of California at this time.

J. E. Peck of the Imperial Valley is one of the livest swine breeders in the valley and has done much to put the Duroc breed on a high plane. He is a steady importer of the best stock he can buy and makes it a point to buy only mature stock. He recently brought in two Golden Model sows, a daughter of King of the Colonels and Crimson Gano, and a daughter of Ryan Chief. There are about 30 brood sows on the Peck place at the present time.

Raise Your Calves on
Blatchford's Calf Meal
and Sell the Milk

More calves have been raised on Blatchford's Calf Meal than on all other milk substitutes combined.

100 lbs. makes 100 gallons of milk substitute, costing only one-third as much as milk.

Prevents scouring and insures the early maturity of sleek, handsome calves.

It is steam-cooked and no trouble to prepare or use.

Write for Pamphlet "How to Raise Calves Cheaply and Successfully with Little or No Milk." At dealers, or

Gummosis

Continued from Page 131

The sulphate of copper is the principal agent in the curing of this disease, but its use in the form of Bordeaux paste or with lime, as suggested, is safest.

Egyptian Corn for Cows

I am feeding crushed Egyptian corn mixed with beet pulp as a grain ration for my cows. I am told it will dry them up, cause them to give bitter milk, etc. Is there any foundation for such belief? So far have noticed no ill effect, but have not been feeding it long. An early answer would oblige C. B. H., Chino.

This inquiry was referred to Prof. F. W. Woll of the State University who writes:

"There is no reason to suppose that crushed Egyptian corn and beet pulp has anything but a beneficial effect on the milk secretion of cows. The influence of Egyptian corn on the milk may not be as well understood as that of beet pulp, as it has only been used as a cow feed to any appreciable extent during late years. However, the practical feeding experience accumulated by this time warrants us in saying that it is a good component of the grain ration for milch cows and will neither dry up cows nor cause them to give bitter milk. Some farmers are inclined to believe that barley has such an influence on the milk secretion, but the results of feeding trials conducted for several seasons at the University Farm, show that it is one of our most valuable dairy feeds, although better results are obtained when it is fed mixed with other concentrates than when fed alone. This, of course, holds good for nearly all feeding stuffs, particularly when fed to dairy cows or to stock fed for a large production. Egyptian corn and other grain sorghums will be found of nearly similar feeding value, pound for pound, as Indian corn or barley when given in rations for dairy cows. But small differences occur in their contents of digestible nutrients. Barley, e. g., contains about 85.3 per cent total digestible matter, kafir 80.0 per cent, milo 79.9 per cent, and gyp corn 79.0 per cent.

Propagating Figs and Olives

What is the best way to propagate figs and olives? What is the best kind of figs for a poor man to plant on five acres? When should a fig tree be pruned, especially where tops are frosted? Could one use wood from the branches of olives which are two inches in diameter and ten inches in length for cuttings? Is it necessary to tie young growing tree to stake? In setting in orchard form which is the best size of tree, large or small? Should one cut back trees at planting time just under the ground?—Subscriber, Fresno.

As to best kind of figs to plant there is difference of opinion as was shown at the recent fig growers meeting at Fresno. Some prefer the true commercial Smyrna, others the White Adriatic, others the Kadota, etc. For a man who is not able to give attention to detail at exactly the right time it is possible that the culture of the Smyrna would be too complicated. In such case the Adriatic or other variety would be best. Either figs or olives are reproduced readily from ripe dormant wood cuttings. We would not prune young fig trees excepting when branches come where not desired. We have seen shapely, healthy olive trees grown from large wood cuttings as suggested. Have even seen cuttings made from logs six or eight inches in diameter, which were quartered, the roots and top growth coming from buds on the bark side. In setting would prefer the larger, thriftier tree, that is, of same age. Where the cuttings are put out at the same time and one grows large and lusty, the other small, the question naturally comes, why is one larger? This will lead to the conclusion that the larger for some reason has a stronger grip on life. We would not cut olives below the ground as suggested; leave practically all of the top. Staking helps in making a straighter and more shapely tree. However, tying up is not done in all cases, some orchardists preferring to have the low-headed, branching type of tree.

Fruits For Home Orchard

Will you kindly advise me of some of the best varieties of the peach and apple, suitable for a home fruit orchard, which would grow well in the Pomona Valley?—Subscriber, Spadra.

Apples: Skinner's Seedling, White Winter Pearmain, Early Harvest, Peaches: Stump the World, Mayflower, Burbank's Family Peach, Yellow St. John, Belle of Georgia.—J. W. M.

Grafting Almond

I have an almond tree 15 or more years old and in vigorous condition, but it has never borne more than a half peck of almonds at a time. What shall I do with such a loafer? Cut it down or will it serve to graft on some other almond or nut that will produce?—Subscriber, Pasadena.

You do not state what variety of almond you have. If it is one of the paper shells, graft in a Drakes Seedling on part of the tree. If it is a Drake's Seedling, Texas Prolific or Languedoc, graft it over to some sort of plum or prune.—J. W. M.

Grafting Persimmons

Can persimmons be grafted? If so, how, and at what time of year? We have two nice trees which bloom every year but never set any fruit.—Subscriber, Tulare

Persimmon trees can be grafted the same as other trees. Any time during February will do.—J. W. M.

New Zealand Flax

I send folder describing New Zealand flax. Has this plant a profitable commercial prospect? Has it been grown in this state?—Subscriber, San Diego.

The fiber from this plant is usually called New Zealand hemp. It is obtained from the leaves of Phormium tenax. Bailey's Cyclopaedia of Agriculture says: "The plant is native of New Zealand and is distributed in many parts of Australasia. It has been

Soil and Water Analyses

Consultation on Agricultural Problems
Mark Walker, B.S., 211 W. First St., Los Angeles

introduced as an ornamental in California and the southern states and also in Europe even as far north as Ireland and Scotland. It is cultivated for fiber-production on a commercial scale in New Zealand and to a small extent in southern Europe. It is the only important hard-fiber plant of the temperate zones. In New Zealand it grows between latitudes 35 degrees and 45 degrees, where it is subject to frost and snow, but it will not endure the more severe winters of our northern states. It grows best in a rich, porous, sandy or loamy soil, moist but with good drainage. Some of the varieties will grow in swamps. It is propagated by transplanting roots. The leaves are cut about once each year, and the fiber is cleaned in part by machinery. The machines thus far brought out leave the fiber but partly cleaned, requiring considerable hand work to prepare it for market. Under favorable conditions the plants yield 800 to 1200 pounds of fiber per acre." The plant has been grown freely in California but we have known of no case where it has been used in this state for other than ornamental purposes. We will appreciate information from any reader of the Cultivator who has produced the plant in sufficient quantity to dispose of it for commercial purposes. Until there is a market assured it would not be safe to plant in a large way.

Eastern Green Corn

Will Eastern green corn seed produce a good crop in California the first year, assuming that conditions are favorable?—Subscriber, Los Angeles County.

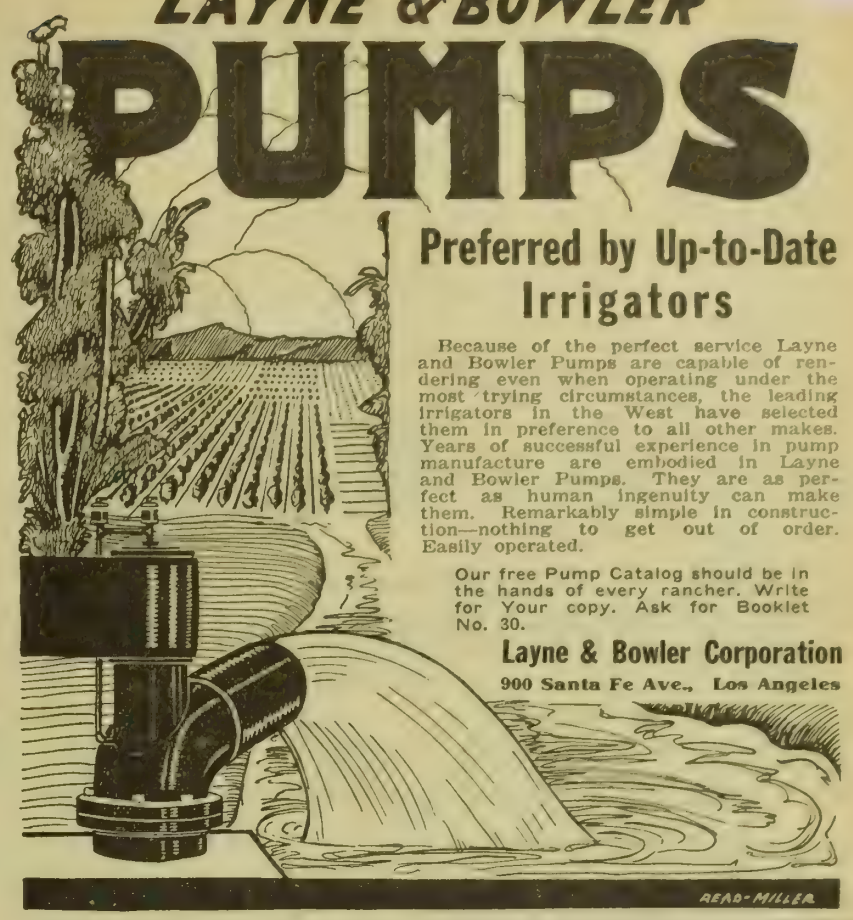
It will not do as well as acclimatized seed. However, our best corn growers find it wise to occasionally secure seed from Eastern growers. The seed grown here for years seems to "run out" so that renewal is occasionally necessary. However, the second or third year's crop from the introduced seed is better than that of the first year.

Steam Heat for Frost Protection

Kindly advise if there have been any successful experiments in the use of steam heating systems in orange groves to prevent freezing. Would like full information regarding any such experiments.—Subscriber, Exeter.

The matter of raising temperatures by the use of steam has been tested in a way but so far as we have learned has proved too expensive. Some accounts of early efforts at frost protection referred to a Riverside method of piling wet straw or coarse manure on screens over fires. The fires were expected to raise the temperature of the water in the straw and release this in the atmosphere. The success of the experiment was only indifferent, and while it was tried a few seasons it was eventually abandoned. This method is referred to in "Climatology of California," Bulletin of the United States Weather Bureau, 1903. It was also referred to in O'Gara's Bulletin No. 5 of the Weather Bureau Station of the Rogue River Valley. He refers to the method as having been used in the 16th century. In the same bulletin Mr. O'Gara refers to the discussions which are to follow, and says: "Frost prevention by means of heating and smudging only will be considered. Various other methods such as irrigation, sprinkling or spraying with water will not be discussed. Bulletin 70 of the state board of horticulture, published in 1896, touches upon various smudge fires, damp smudge method above referred to, and other methods. In this same bulletin on page 15 Mr. H. C. Finkle's plan is described as "providing for the erection of several large plants for the evaporating of water from pans in coal oil furnaces. On page 233 of Climatology of California above referred to we note that Wright Brothers of Riverside used a 35 horsepower boiler and two-inch pipe for delivering warm or hot water into irrigation furrows. By the use of this device they were able to raise the temperature nearly 30 degrees but the expense was found prohibitive. The point seems to be that it costs more to raise the temperature of water and use that to raise the temperature of the air than it does to apply the heat direct to the air.

LAYNE & BOWLER PUMPS



Preferred by Up-to-Date Irrigators

Because of the perfect service Layne and Bowler Pumps are capable of rendering even when operating under the most trying circumstances, the leading irrigators in the West have selected them in preference to all other makes. Years of successful experience in pump manufacture are embodied in Layne and Bowler Pumps. They are as perfect as human ingenuity can make them. Remarkably simple in construction—nothing to get out of order. Easily operated.

Our free Pump Catalog should be in the hands of every rancher. Write for Your copy. Ask for Booklet No. 30.

Letters to a Beginner

Written for California Cultivator By Jean A. Koethen

WHAT THE BABY CHICK NEEDS MOST

DEAR GEORGE: Your experience with that first incubator brood was surely heart-rending. It made me think of my own "first time," the time I learned once for all what a chick needs most. I knew about as much about raising chicks as a cat does—rather less, perhaps, for she would not have let them suffer—but the chicken fever got me and I bought 50.

I had watched 100 little White Orpingtons belonging to a neighbor play around their fireless brooder, which stood right out in the wind on the damp ground. Surely if he could raise chicks that way, I could. How was I to know that I was following a blind leader, or that his chicks were dying off by threes and fours, chilled by that dreadful fireless brooder We made a brooder like his, only we made it as large for 50 chicks as his, which was designed for 100 and was too big for them, manufactured an elaborate hover out of an old broadcloth skirt, set the brooder out on the ground in the wind, and awaited results. They came, oh, very quickly. Next day some chicks were "stuck up" behind. I consulted a neighbor and was told that brooder chicks almost always got white diarrhoea, that I should have given them milk to drink instead of water, and that very likely they had been eating adobe, which was always fatal. After a day or two, as more and more became "stuck up" and they stood shivering in bunches, trying to keep one another warm, I got a "hunch" that they were cold and put up wind breaks, but it was too late. They were as cold at night as during the day, anyhow, and morning after morning I went out with fear and trembling to find always more and more dead in the corner where they had crowded in the hope of finding warmth. My heart nearly broke, George, when I realized that my own stupidity was responsible for those 40 deaths—for only ten survived—but I had learned my lesson, and from that day to this I have never lost a chick from chilling, except perhaps once in a great while one that was smothered by a careless hen.

What is the first need of the baby chick? Just the same as the first need of a human baby, warmth and quiet and a chance to sleep. The trip out of the nowhere into the here is a long, weary one, for both human baby and chick. The chick has been for three weeks in a temperature of 103 degrees or more, and the air of a brooder that is heated even to 98 or 99 degrees must seem pretty chilly at first. As for the nursery of the incubator, that is an uncertain quantity, but we have this test, whether the chicks are in incubator or brooder: If they lie down comfortably and sleep they are warm enough; if not, then not. You can't depend on the thermometer, but the chick's appearance and attitude never lie.

You will find brooding chicks by the hundred a more difficult matter than handling small hatches. Your losses will be greater, but labor will be lighter, so the two balance pretty well. Just the other day I visited a brooder house where 1000 chicks had been brooded. It was a very simple affair, just a square house with hot air coming up in the middle from a stove outside. Had the heat come up through that hole in the floor with nothing above to keep it from being dissipated through the house, the chicks could never have been kept warm, but there was a sort of hover above the hole, just a board affair, without felt or cotton, but it kept the heat at the level of the floor, and 90 per cent of the chicks had lived and thriven. The owner admitted that he preferred hot water to hot air for brooding, but the hot air brooder was what he had, and the chicks had done pretty well because they were warm.

A good many people have tried in the past to make us believe that there is a terrible hobgoblin called white diarrhoea that stalks through the country seeking to devour every baby chick. Don't let them scare you. I think they've rather had the wind taken out of their sails of late by the experiment stations which have found that while there is a disease they call bacillary white diarrhoea, it isn't nearly as common as we once thought, and that nearly all the deaths of baby chicks which are apparently caused by diarrhoea, are really caused by chill.

We Give Away Shetland Ponies to Boys and Girls

Send in Your Name Today----Just the Prize Every Boy and Girl Wants

Wouldn't you like to own a nice gentle Shetland pony, one that you could ride and drive to school or anywhere? Well,—here is your opportunity to get one, without its costing you one cent of your money. You might just as well have one of these Shetlands as anyone. I have given away many fine Shetlands and now I am going to give away some more to advertise this paper, and the first thing for you to do is to send me your name and address on the blank printed below so I can write and tell you all about it. You can get one of these Shetlands or a fine, gentle Hungarian pet pony easily and quickly, for doing a little work for us that you can easily do during your spare time. Many other boys and girls say it is easy, and I believe you will say it is easy, too.

You Can Get a Shetland Like This One

DO YOU WANT A SHETLAND?

My plan is an easy way to get one. Many boys and girls who have to walk to school have sent to me for a Shetland pony. It don't make any difference where you live outside of cities of over 25,000 population, or what you do, you have just as good an opportunity to get one of these Shetlands as anyone. It costs you nothing to enter and as soon as we receive your name and address we will send pictures of other ponies we have given away and tell you all about it. We are going to give away three ponies and many other fine prizes and money Saturday, March 24, 1917, to boys and girls who do some work for us that will be easy for them to do. With the first prize pony, "Sparkle", we will give away a fine pony runabout and harness.

A PRIZE FOR EVERY BOY AND GIRL

And here is another important point. If you send us your name and address at once you will be entitled to take part in the Extra Prize Awards and you can sure earn a fine camera and gold watch or other valuable prize. You cannot lose, everyone taking part will receive a prize or cash for the work done.

These ponies we give away are all gentle and well broken and safe for children to ride and drive. A Shetland pony is a child's horse and they are loving and kind and learn to do many cute tricks. They are valuable animals, too. A Shetland pony would make the nicest present a child could possibly own.

Fathers and mothers who want a Shetland for some member of the family should take advantage of this opportunity.

Each Pony Is Gentle and Well Broken

What They Say:

I have already given away many fine Shetland ponies and pony rigs to boys and girls, and if you haven't a pony, now is your time to get one. And the boys and girls who received these ponies have written and said that they were delighted with their ponies, and you would be, too. Some say they have been offered $200 for their pony and outfit and wouldn't accept it, so you see these are valuable prizes we give away.

Hanford, Cal., Dec. 30, 1916.

Dear Pony Man: I received "Mary" the day before Christmas, and brother Arnold and I went with Grandpa to get her. I was so pleased to get her and the outfit. Many thanks, and I would advise all little boys and girls that want a pony to enter as I did.

Charles Edwin Teague.

Downey, Cal., Dec. 29, 1916.

Dear Pony Man: Words fail me when I try to thank you for the beautiful little bay and white Shetland pony which you sent me with saddle, blanket, and bridle. He is as clever as he is beautiful, and I know there was no boy more happy than I was when my pony came to me .

You have been only too good to me for the amount of subscribers I sent in. Thanking you again for my pony and your kindness to me, I am sincerely,

Leslie B. Riggins.

Ventura, Cal., Oct. 27, 1916.

Dear Pony Man: I want to thank you very much for the fine pony "Trixy" which you sent to me. We all think a great deal of her. She is as gentle as can be, and she lets me on her back without either saddle or bridle. We were very much surprised to see such a fine buggy and harness—surely it was far above our expectations. It is certainly fine and dandy.

Thanking you again for my dear pony, I am ever a friend,

Beulah De Witt.

If you would like to know about how to get one of the Shetland ponies we give away sign this blank and mail it today to Pony Man, California Cultivator, 115-117 North Broadway, Los Angeles.

Please tell me how I can become the owner of one of the Shetland or Hungarian ponies you are going to give away.

If the baby chick is chilled during the first two or three days, the yolk of the egg, which was taken into its abdomen the day it hatched, cannot be digested there is diarrhoea or perhaps constipation, and the chick, being at first a very frail little creature, loses its slender hold on life.

Others will tell you it is eating too soon that kills baby chicks. Don't believe them, either. A chick does not care to eat till it is nearly 48 hours old. When it has had its sleep out and begins to feel good and chirpy, peeping out through the feathers of its mother's wing, if it is fortunate enough to have a mother, hunting in the chaff and sand on the brooder floor for eats, if it has only a foster-mother, then it is time to feed, no matter how old the chick is. A little common sense goes a long way in raising chickens, George. If you once understand the chick and its needs you can raise them any old way, under the kitchen stove, about a jug of hot water, or in a box without any heat at all. But write this large on the pages of your understanding, that the first need of the baby chick, and the second, and the third, is warmth.

Here's hoping you will have better success with the next hatch.

Aunt Jenny

Wonderful Egg Producer

Any poultry raiser can easily double his profits by doubling the egg production of his hens. A scientific tonic has been discovered that revitalizes the flock and make hens work all the time. The tonic is called "More Eggs." Give your hens a few cents' worth of "More Eggs" and you will be amazed and delighted with results. A dollar's worth of "More Eggs" will double this year's production of eggs, so if you wish to try this great profit maker, write E. J. Reefer, poultry expert, 4262 Reefer Bldg., Kansas City, Mo., who will send you a season's supply of "More Eggs" Tonic for $1.00 (prepaid). So confident is Mr. Reefer of the results that a million dollar bank guarantees if you are not absolutely satisfied your dollar will be returned on request and the "More Eggs" costs you nothing. Send a dollar today or ask Mr. Reefer for his Free poultry book that tells the experience of a man who has made a fortune out of poultry.—Adv.

Limited Number of Chicks from Hens That Laid 194 Eggs Each Last Year

Wishing to help poultrymen to get high grade stock for building up their flocks, we have made arrangements so as to offer a small number of chicks from F. M. Molby's famous 194-egg hens.

So long as they last we make this offer: With every order for 500 White Leghorn chicks we offer FREE 25 Molby chicks and with every order for 1000 chicks we offer 50 Molby chicks free.

SCHOFIELD and OLSEN AT VAN NUYS will sell choice pullets 10 weeks old, all broken to roost at 55c each. This is for a short time only. Address all communications to

Educational Committee's Report

California State Poultry Breeders Association

By C. A. Wilkins, Secretary

A MEETING of the educational committee of the California State Poultry Breeders' Association was held in the Chamber of Commerce rooms, Sacramento, November 4. After discussion regarding the Breeders' Association and its best interests, it was decided to visit the university farm at Davis with a view of gaining all knowledge possible regarding the industry. On arrival at Davis we were met by Prof. J. E. Dougherty and escorted to his office and there discussion was opened relative to the poultry industry.

Regarding the matter of instruction at Davis we find the number of regular students total 50, short course 55. Considerable investigation work has been done by the division but the results have not been made known to the breeders owing to the fact that no publicity work is issued by the division other than the bulletins of the university. It is the opinion of this committee that a bulletin should be issued monthly by the division to all breeders throughout the state upon application. Much larger research work could be done with greater appropriations, and the department seems to be doing everything possible with the limited funds at hand.

Ten acres is devoted to the poultry plant and more land can be had whenever requirements demand. All standard makes of incubators and brooders are used for instructional work among the students. Fifteen hundred White Leghorns are used in the experimental work and about 300 of other breeds. It seems the White Leghorn is the cheapest bird to experiment with and nothing more will be done with other breeds until more funds are at hand to purchase breeding pens of other varieties.

In the matter of research and ex perimental work and instruction the committee feels there should be a better representation of standard bred poultry covering all classes and thereby giving all breeders a chance to know the results that are obtained by this department from the respective breeds.

The department does not favor exhibiting the stock of Davis farm at state fairs or any local fair at the present time. This committee does not favor this idea, and we believe the division should exhibit at all fairs whenever possible so to do, even though they do not enter into competition with other breeders. We feel as though birds should be shown in order that breeders may have the benefit of the work of this department.

Regarding egg contests, Professor Dougherty thinks this is one of the best things that can be done to stimulate breeding. The following suggestion was offered by him, namely, that 50 poultrymen among the membership of the state association be appointed as an advisory committee to confer with him quarterly with a view to estimating the results and offering suggestions for experimental work which would be of greater benefit to the poultry industry of this state. We recommend that the president appoint this committee at the earliest possible date.

The total amount invested in the poultry department at the Davis farm is about $50,000. The sum required for overhead expense is about $25,000. In order that the department may be placed in a position to do more experimental work the committee feels that something should be done towards obtaining additional funds for the proper maintenance of this department. With this additional fund Professor Dougherty states many new features could be introduced. A bacteriologist and extension workers could be provided and better equipment supplied. More publicity is needed.

To establish closer relationship between the breeder and this department we must have the hearty cooperation and support of each and every member, and in order that this department may be made of greater value to the community by the proper securing of legislation and funds, each breeder by consulting the state assemblyman and senator in his district, could do valuable work if they make it known to the state officers in their respective districts just what legislation and funds were needed by the poultrymen of this state. Signed.—John T. Skelton, A. H. Currier, James D. Yates, F. H. Green, C. A. Wilkins.

BLUESTONE FOR COLDS

"Many poultrymen have been using permanganate of potash to prevent the spread of colds and other catarrhal diseases," says a bulletin from the Storrs, Connecticut, agricultural experiment station. "During the past two years this product has risen in price from 50 cents a pound to $2.50 and $3.00 a pound. Thus it is not surprising that a good substitute is being looked for. One authority suggests the use of bluestone or copper sulphate which can be used as follows: Dissolve four ounces of the bluestone in a quart of water, this to be known as a stock solution. Add one ounce of this solution to each gallon of the drinking water. This can perhaps be well used for a short period but should not be too long continued. Furthermore, one ought to use enamelled or earthenware vessels as the copper sulphate solution may produce undesirable chemical changes when used in galvanized pans."

Leland Fobes of Loomis has been elected director of the Sacramento Valley division of the Poultry Producers' Association of Central California vice Leonard W. Eskridge resigned.

HOGS

Smith's Poland-Chinas—Sows and gilts bred to Joker, first prize boar at Wisconsin State Fair 1915. These sows and gilts were sired by Iowa Wonder, who is a son of the great A Wonder, the most celebrated Poland-China boar living or dead. Litters from this mating are the best I have ever seen anywhere. Prices low, quality considered. Will sell one or a carload. As a special inducement each purchaser will be given a year's subscription to the American Swineherd, the best swine paper published, and a copy of the Handbook on the Sow, also a copy of the Pig Feeders' Manual. Geo. A. Smith, Corcoran, Cal.

Grape-Wild Farm Berkshires — World's Fair Grand Champion Grand Leader 2nd heads our herd, not only himself a champion but the sire of champions. At the 1916 California state fair his daughters won all of the senior sow classes including the grand champion sow. At the 1916 Oregon state fair a Grand Leader sow was junior champion. We are offering a number of choice boars of exceptional breeding and are also booking orders for fall pigs. A. B. Humphrey, Escalon, San Joaquin Co., Cal.

Send for Free Catalog—Finest ever issued. Tells of the famous Whitten Ranch money making strain of Big Type Poland-Chinas. Make greatest weight in shortest time at lowest cost, topping market at 225 lbs. in 6 months. 600 head, both sexes, all ages, reasonable prices. Satisfaction guaranteed. Ranch in Tulare County, but address owner, R. H. Whitten, 610B Security Bldg., Los Angeles.

Billiken Herd of Chester Whites—The big prize winners at the 1916 California state fair. The breed that makes money for the rancher and dairyman. Have 4 nice young service boars left and 20 young open gilts that will be bred as desired by buyer. Write for the Chester White booklet that tells all about them. C. B. Cunningham, Mills, Cal.

Poland-Chinas—Twenty good gilts and three 2-year-old sows for sale. Either sired by or bred to I. B. A. Wonder, reserve champion at P.P.I.E. A few good young boars ready for service, sired by I. B. A. Wonder. A fine lot of fall pigs. I please you or refund your money. W. A. Young, Lodi, Cal.

Large Yorkshires—Choice spring boars, gilts and weaned pigs from champion sow P.P.I.E. or from breeding of champion boar and sow Sacramento, 1916. If you see them grow you will like them. Riverina Farms, Paradise Road, Modesto, Cal.

Superba World's Grand Champion Poland-China boar and one of the greatest sires of the breed. Spring boars ready for service, also few sows bred to this noted sire, reasonably cheap. Rough's Greenfields, Arlington Sta., Riverside, Cal.

50 Bred Sows and Gilts, 50—Of true Berkshire type and quality; bred to grand champion boars are included in our private sale list now ready for mailing. Write for it today. Silver Birch Farms, Box C, C., Newport, Wash.

Registered Poland-Chinas, prolific, fabulous, profitable, porkers. Choice young boars now ready for service, $25 each, weanlings $15 each. Dr. J. A. Crawshaw, Hanford, Cal.

FARMS WANTED

Wanted to hear from owner of farm or fruit ranch for sale. O. O. Mattson, Minneapolis, Minn.

DOGS

Fox Terrier Puppies For Sale. Inquire of Dixon Poultry Yards, Dixon, Cal.

SORGHUMS

The sorghums are generally classed into two groups, says J. F. Nicholson of the University of Arizona. "The saccharine, a mild sorghum used for syrup making or for forage, and the non-saccharine sorghums, sometimes called grain sorghums, used for grain and forage.

"The grain sorghums are of tropical origin, and flourish best in hot climates. They are particularly drouth resistant, and admirably adapted to the semi-arid regions of the South. They reach their best development under eight to ten inches of rainfall during the growing season.

There are three general types of grain sorghums classified according to the character of head: Kafir, with compact, erect heads; durra, with compact, pendant heads; broom corn type, with loose spreading heads.

"The varieties of grain sorghums profitably grown in Arizona that belong to these types are as follows: Black hull white Kafir, dwarf and standard, white milo or durra, yellow milo, generally called milo maize, dwarf and standard, feterita, one of the durras, shallu, a broom corn type, sometimes called Egyptian wheat, kowliang, another broom corn type."

ONE WAY OF FIGHTING MORNING GLORIES

The Colorado Agricultural College gives another way of fighting morning glories:

"If amber cane or sudan grass do well in your locality, probably the best thing you can do to clean up land infested with morning glories, will be to plow at least twice each year and produce a heavy crop of cane or sudan grass on the land. These crops, if they do well at all, do so well as to smother out almost any other growth. With early disking and plowing before the preparation of the seed bed and by plowing after the crop is removed, seeding of the morning glories can almost be prevented. It is necessary to prevent seeding, if the crop is to be killed out. It is quite likely that such treatment will have to be repeated for two or three years in order to be really successful."

A bill providing for the eradication of yellow star thistle and other injurious weed pests has been introduced by Senator Duncan of Oroville. This bill is the result of efforts put forth by the Sacramento Valley Development Association, their interest having been aroused because of the seriousness of the aforementioned thistle in certain counties of the Sacramento Valley, and the great difficulty experienced in its control.

A pure seed bill has been introduced into the legislature by Senator Rigdon of San Luis Obispo County.

COMMERCIAL HELPS AND HINTS

Don't fail to learn about soil bacteria. An interesting booklet called Westrobac will be sent free by the Western Soil Bacteria Company of San Francisco.

Don't neglect to save the furs from the wild animals you catch. They are worth money. Write E. R. Skinner and Co., Sacramento, for full information.

Don't forget to read the advertisements in the Cultivator. They show what you want and tell you where to get it.

The new catalogue of the Valley Seed Company of Sacramento has just been issued. It's worth writing for.

Morse's 1917 seed catalogue is just off the press. It's better than ever. A postal request will bring it.

The Cunningham land roller pulverizes the soil most perfectly. A circular of this valuable farm implement will be sent free by the Spalding-Robbins Disc Plow Co., San Francisco.

"HOGS FOR PROFIT"

Mr. R. H. Whitten has issued a unique and exceedingly attractive publication, "Hogs for Profit". Mr. Whitten's office is in the city of Los Angeles; his ranch near Terra Bella in Tulare County. Mr. Whitten's favorite is the Poland-China of the Big Type. In his booklet he says: "The chief demand of the practical farmer is for size—not at the expense of quality, but with quality. He wants a hog that will ripen quickly for market at 200 to 250 pounds, if desired, or that may be profitably carried to 500 or 600 pounds, or even more. To get these results he must have foundation animals that do not stop growing until they attain an enormous size. Big boars and big sows mean big pigs at farrowing time. Big pigs grow faster and make greater gains. And economical gains are what every man in the hog business wants."

A Pennsylvania Farmer Says Concerning Electric Motors on His Farm

"A one-horse power motor is located in the spring house for separating milk, churning butter, turning a grinding stone, etc.

"In the house, my wife has a ⅙-horse power motor for running a washing machine. This motor can be attached to any lamp socket.

"In the barn a 15-horse power motor mounted on a little truck may be moved to any part of the barn or barnyard for grinding feed, baling hay and threshing grain. By extending the cable we have used this motor 400 feet from the barn."

This letter suggests equally profitable installations around your house and barns. The General Electric Company manufactures all sizes of electric motors for farm use. Information will be gladly furnished by your lighting company or our nearest motor agency.

AN OLD VALENTINE

When slumber first unclouds my brain
And thoughte is free
And sense, refreshed, renews her reigne,
I think of thee.

When next in prayer to God above
I bende my knee,
Then, when I pray for those I love,
I pray for thee.

And when the duties of the day
Demand of me
To rise and journey on life's way
I work for thee.

Or if, perchance, I sing some lay,
Whate'er it be,
All that the idle verses say
They say of thee.

For if an eye whose liquid light
Gleams like the sea
They sing, or tresses brown and bright,
They sing of thee.

And if a wearie mood, or sad,
Possesses me
One thought can all times make me glad,
The thought of thee.

And when once more upon my bed,
Full wearily,
In sweet repose I lay my head,
I dream of thee.

In short, one only wish I have—
To live for thee,
Or gladly, if one pang 'twould save,
I'd die for thee.

A VALENTINE REVIVAL

DR. MARCH, on his rounds, dropped in to see Annie Tupper as a matter of course. Annie was a cripple and dependent for a home upon her married brother, a hard-working mechanic; and though her good friends, busy folk all, called as often as they could to make sure that comforts were not lacking, she spent many hours alone. When Annie saw who was at the door her face brightened with pleasure, for the bluff, kindly old surgeon had been her friend and confidant for many years.

"What's all this, Annie?" he asked with interest; "been playing paper dolls all by yourself?"

She laughed in some embarrassment "There, now! I was hoping you didn't notice; but of you won't tell I'll let you into the secret. Well, doctor, I'm making valentines."

"Valentines!" There was wonderment in his tone.

"Sounds foolish, don't it? But it's like this: Sitting here alone, I guess I think more about the holidays than if I was up and doing; and sometimes I get low-spirited, thinking how much more they used to mean than they do now. Wicked, ain't it, and me so well fixed? The other day, when I saw how near the 14th was, I began thinkink about the days when I was young and straight and pretty and used to get a peck of valentines every year. I was getting real sorry for myself, when all of a sudden, thinks I, 'Annie Tupper, do you s'pose your plain, middle-aged face is the only one St. Valentine don't notice nowadays? How many of your friends that's over fifty ever see a valentine any more?' To be sure, their lives are fuller'n mine, so maybe they don't miss such things much! but all the same I bet they like it when some one remembers. So I made a list of the getting-middle aged ladies with no beaux or husbands, and the married ones with husbands that look too busy or matter-of-fact to remember birthdays and Valentine days and such things, and I made up my mind I'd send 'em each a little remembrance my own self even if it wasn't much.

"I think it's a beautiful idea," said the doctor, heartily. He was deeply touched by the thought of those patient hands undertaking such a labor of love; he wondered, too, whether his own quiet, gray-haired wife was on the list, and counted remorsefully the years since he had remembered her violets on the good saint's anniversary. "You're a good little soul, Annie!" he added, impulsively.

"Not such a saint as I might be," Annie confessed, with a twinkle of fun in the brown eyes; "sometimes, looking through the list, I can't help being tickled, thinking what good subjects for 'comics' some of 'em would make. There's Mrs. Adams' slack housekeeping, and her bonnet over one eye; and the way Mrs. Wood gossips; and Mary Trask, with her big hats and short dresses and high heels, trying to look like a spring chicekn; and—oh! lots of funny little ways that folks have. But when such things come to me, I remember how Mrs. Adams wore herself out nursing me when I had fever, and how generous Mrs. Wood is; and as for Mary, she's a perfect angel to her grumpy old father, and a master hand at cooking, as I've reason to know. Every one of 'em's been good to me, and I only wish I had something better to give than my little paper fixings."

Valentine's day arrived, bright and cold. Toward evening Doctor March could not resist dropping in to see Annie for a few moments. The invalid sat in her chair by the window, her face flushed with excitement and happiness. In her lap, caressed by her thin fingers, was a heap of bright cards and dainty trifles, while more substantial reminders of the day were in evidence.

Annie looked at him with radiant eyes, "Oh, Doctor March, what a good time I've had!" she sighed, blissfully. "Why, all day long the doorbell's been ringing, and valentines just pouring in—some of 'em so funny and cute they made me laugh, and some so sweet I 'most cried. And even my pussy cat got one—didn't you, Topsy? See the dear little bundle of catnip some one sent her! Folks have been good to me before, but it just seems as though these loving, frilly, not-useful things make 'em seem more friendly than ever. Doctor," her face clouded with sudden anxiety, "you didn't tell on me, did you? I'm afraid if wouldn't be quite so—so perfect, if people knew I was going to send to them, and wanted to sort of even up you know."—Exchange.

A VALENTINE PARTY

Written for California Cultivator by Georgie Palla

HERE are my plans for a valentine party for young folks. I live in the mountains, 1600 feet elevation, 10 miles from a railroad. The land is in large ranches and neighbors not very near, but we get together and have some very enjoyable times.

Invitations: Send squares decorated with hearts and cupids cut from red mounting paper or red blotting paper and paste on or, if handy with brush, paint or draw them.

Who's Who (guest's name).

When? When? February 14, 8 o'clock, p. m.

What? What? Valentine box, bring comic valentines for guests.

How? How? Make them or buy them.

Games: Have valentine box near door so guests can mail addressed valentines. Pin a large red heart on wall for target. Have paper arrows for each guest, blindfold and have them pin arrow on heart. Best one to receive box home-made candy. Consolation prize, all-day candy sucker.

Another game: As many words as

can be made from the words "Saint Valentine," For this game choose partners thus: Cut hearts(one-half number of guests). Write familiar verses, names of songs or proverbs on each. Cut in two; let guests match to find their partner, keeping one-half for the boys and other half for girls to draw from.

Luncheon: Fruit salad (or cocktails) in red jello, crackers, ham and mustard sandwiches, cheese and pimento sandwiches or bread and butter sandwiches. White layer cake, pink fruit color icing. Drinks: Chocolate or lemonade. Nuts, candy, red apples.

Make fruit salad from oranges diced and bananas sliced acording to "jello" directions; serve on lettuce leaf. Add spoonful whipped cream on top.

Open valentine box.

VALENTINE PARTY

Written for California Cultivator
By Mrs. Otto Kohler

TO be given the Junior High School class, an afternoon or evening affair.

Invitations

I will cut double heart shapes from white note paper, outline with red and gold (water colors) and then inscribe "To my Valentine." On the inside write the invitation. These may be cut in size to suit ones taste.

Decorations

Now comes the decorations for livingroom and dining room. I shall take red and gold color crepe paper, cut in strips about three inches wide and crinkle the edges. Now take strips of the two colors and drape from the chandelier to all the different corners of the room. When this is done cut hearts of the same colors, the red a little smaller than gold, tie the red on top of the yellow with a small ribbon, paint an arrow of gold on the red heart. Attach one of the hearts every three or four feet on the draped strips. Have one large gold heart with a red heart tied on each side to hang under the chandelier which will be over the table in the dining room or one can have a kewpie to swing under the chandelier.

The Table

Have my linens snowy white. For the centerpiece have a large kewpie wearing a big sash of red and gold ribbon. Lay plates for the number to dine. At each plate have a small kewpie wearing a red paper heart down back and front, being inscribed on the back "To my Valentine," on the front the name of the person to be served. Will have red baby ribbon tied to the small kewpies leading to the large one in the center which may stand in a mass of asparagus fern. Also have the red and gold hearts pinned on the table cloth between guests. This is very simple and pretty and the small kewpies make lovely souvenirs.

Refreshments

Hot tamales served with tomato sauce on a lettuce leaf, pimento sandwiches and sandwiches made of Neufchatel cheese and chopped walnuts mixed with mayonnaise. Cut sandwiches in heart shape with cookie cutter. Serve pickles (sweet) and olives.

A nice gold loaf cake decorated with candy hearts. If possible carry out the red and gold color.

Pineapple ice cream with chopped nuts sprinkled on top. Coffee with whipped cream.

There will be dancing and card games to help work up an appetite as these are the usual amusements in this vicinity.

NEXT HOUSEHOLD CONTEST

The next household contest will be on the Kitchen Garden. The making and the tending of the kitchen garden generally fall to the housekeeper and it is a pleasant change from indoor work—if there isn't too much of it. Of course the heavier details need man power or horse power, but many women find the planning and general care a solid satisfaction.

According to your means in time and strength, what do you find the most satisfactory kind of planting?

I know a business woman living in a tiny rented house in the city who has much satisfaction in the chayote vine growing over her back porch, the tomatoes and onions, parsley and mint, Kentucky Wonder and sweet corn in a tiny patch of ground. For the minimum amount of labor these furnished her last year many dinners of fresh vegetables. She knows nothing of farming, but "sticks in" the potatoes and beans and somehow they grow and flourish and save many a dime and dollar. This fall she visited a city bred girl who is now living on a real ranch and had a chance to see a real vegetable garden on a real acre of fenced ground where the horse and plow and the hired man are available for the heavy work when needed. There were berries and grape vines on trellises at the sides, artichokes and rhubarb at the ends and cabbage, tomatoes, etc., etc., in rows and rows, well tended, crisp and delicious.

Here is a pocket handkerchief garden and a really truly one. Which is yours? Or does yours lie in between? Maybe it's still a "some day" garden. Whatever it is let us hear what it is and what it means to you—in dollars and cents if you have records.

Cash Prizes

For best article will be given $2.00 cash; for second best, $1.00. All published will entitle sender to three months' extension of subscription to California Cultivator. With your article send name and address of one to whom you wish extension credited. These will be published in the issue of February 28 and should be addressed to Household Department, California Cultivator, Los Angeles, and mailed so as to reach this office anytime before February 17, the sooner the better.

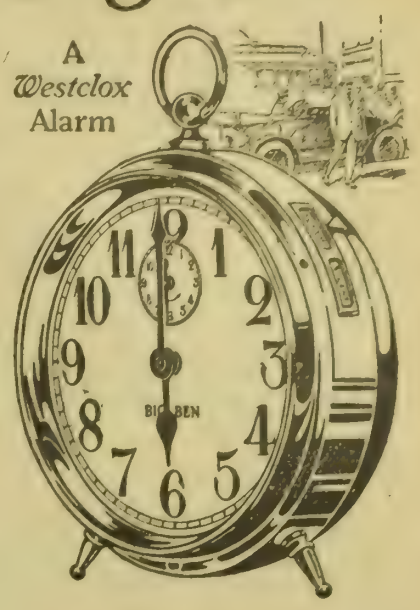
PRIZE WINNERS

Prize winners in the Valentine party contest are Georgie Palla, first, and Mrs. Otto Kohler, second.

Health authorities have been telling us for a long time that nervous disorders are on the increase and that the cause is our manner of living, our efforts for social and business supremacy. In this connection the public health service says: "So far as is known no bird ever tried to build more nests than its neighbor; no fox ever fretted because he had only one hole in which to hide; no squirrel ever died of anxiety lest he should not lay by enough nuts for two winters instead of one; and no dog ever lost sleep over the fact that he did not have enough bones laid aside for his declining years."

The need of books in the farm home cannot be too strongly urged upon the young man and woman when they begin life in the new home. Reading is something that must be indulged in often or the desire is apt to wane. Provide the living room with a generous reading table, a neat bookcase, and a desk for letter writing.

Big Ben



SIX A. M. for the big man of business—who knows the luxury of ample time—who's up before duty insists. Try Big Ben in the business of living. Set him a little ahead.

There's success in his wake. With mind alert you're on good terms with a new day.

You'll like Big Ben face to face. He's seven inches tall, spunky, neighborly—downright good.

At your jeweler's, $2.50 in the United States, $3.50 in Canada. Sent prepaid on receipt of price if your jeweler doesn't stock him.

Legal Queries

Louis B. Stanton, attorney, 243 Wilcox Building, Los Angeles, will answer legal queries in this department.

Immediate mail replies cannot be given except where fee to Mr. Stanton is paid. When replies are wished in Cultivator address query to 115½ N. Broadway, Los Angeles.

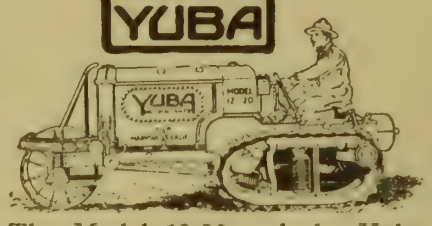
Unsigned communications receive no attention.

Trust Deed

I have a dairy ranch on which there is a trust deed about to become due. The holder will not renew same and I am not in position to pay it. The deed is in my wife's name and has never been in my name. When the trust deed and note were executed I signed with my wife. If the owner of the trust deed starts foreclosure proceedings must he not get personal service on my wife?—Subscriber.

Under the terms of the usual trust deed it is unnecessary to bring any action of foreclosure. All that is required is publication of notice of sale and public sale by the trustee. At that sale the property is sold to the highest bidder, and if sold for less, the amount of the sale is credited upon the trust deed and action may be taken upon the note for the balance due. In case the property is sold for more than the note and costs of sale, the excess is returned to the trustor. So that in the above case, since both husband and wife signed the note, both would be liable on the note if there was any deficiency.

BUY A YUBA



The Model 12-20 and the Yuba plow form a one-man outfit—even in the orchard.

An all around machine though it was designed especially for the orchard.

It plows 10 acres, cultivates 25 acres, and hauls 12 tons per shift. It will operate a 6-inch pump.

It is narrow enough to go in 7-ft. hop rows, or 7-ft. vineyards.

Write for catalogue.

Yuba Manufacturing Co.

Department B 1

433 California St., San Francisco

Joint Tenancy Deed

Is the deeding of community real estate to both husband and wife the best way to hold the property so that in case of death of either party the property would revert to the living without expensive court proceedings? If there is a better and less expensive way of accomplishing the same result please explain how one should proceed. In this case there are no children.

A deed is sometimes made to two parties, such as husband and wife, as joint tenants with the right of survivorship. In such instance, upon the death of either of the parties ,the title vests in the other. To complete the chain of title it is necessary to file a petition in the superior court setting forth the fact of the death and procuring a decree establishing such fact of record. The above method while not essential is universally required by all careful abstractors. Another method achieving the same result is by homesteading property. The additional benefit from homestead lies in securing the property against creditors both in the lifetime and after the death. As to which method is best, depends, of course, upon the nature of the business which the parties are engaged in. The same mode of procedure is found advisable in case of homestead as in the case of deed under joint tenancy.

Avoiding Probate

What can I do with my own hand and pen to prevent my property from passing through the courts at my death? I want my wife and children to have it divided without going through the courts.—Subscriber.

The efforts of the average man of any amount of property to draw more or less complicated legal papers himself or with the information derived from legal handbooks has probably been one of the most prolific sources of income to the legal fraternity. Knowing nothing of circumstances I would refrain from giving any advice other than to go to a competent attorney in your locality and consult with him upon the subject. This would cost you a comparatively small sum and would certainly be good insurance.

Title By Occupancy

A permits B to live on a piece of land. B builds a room, puts out a garden and keeps chickens. Is there any law which permits B to acquire title to the land he cultivates?—Subscriber.

In view of the fact that B has no written claim of title to the property the only possible means by which he can gain title by adverse possession is by protecting the property by substantial enclosure and cultivating or improving it and paying all taxes, state, county and municipal, levied and assessed upon the land, for a period of five years continuously. Adverse possession invariably requires that persons occupy the land under a claim of ownership; a mere permissive occupancy is never sufficient to found an action for adverse possession.

Community Property

Man and wife accumulate property after marriage; the husband signed over this property to his wife three or four years ago. Is it still community property or now can he claim one-half of the property on a separation?—Subscriber.

It is only stated that a separation had between husband and wife. In such instances any division of the property or provision for separation is usually a matter of contract between the parties. If an action for divorce is instituted the court may assign community property in such proportions as it may deem just in case the action be upon the ground of adultery or extreme cruelty. If upon any other ground the community property must be divided equally between the parties. Although the property is, as to third parties, possible community property as between the husband and wife it depends entirely upon the facts attending the vesting of the property in the wife. It is the presumption of law that a married woman in whose name title is vested owns that property as her separate property. That is, however, but a presumption and may be rebutted upon proving that there was no gift in fact. It places the burden upon the husband of proving his case.

Title

A's mother sold a piece of land to B many years ago and B after keeping it many years sold to C. C in looking up the records finds that he has no clear abstract. Now B is after A to clear it with C although A's mother is dead. A bought that piece of land and signed it over to his mother. B's lawyer now writes A that he was once interested in the property and failed to release it or his mother forgot to record it. Now all that A can see in the matter is that he lived with his mother on the farm and has a child's share in it yet. Now could you kindly tell me whether A could collect child's share by law or not?—Subscriber.

The length of time transpiring between the different transfers above noted is not given, and it does not appear whether or not A was a minor either at the time of his deed to his mother or at the time of her death or now. It would probably be the case that if B and C had lived upon this land, cultivated it or improved it in the usual manner, protected it by a substantial enclosure and paid taxes on it for a period of five years that adverse title to the land is in C, so that he could quiet title in himself by appropriate method, especially if it was shown that there was a complete chain of title with the exception of possibly somebody along the line forgetting to record a document. If A is, or during any of the time has been, under the age of majority, then the period during which adverse possession might be attained would be extended up to 20 years. It is possible, however, that A might have some interest in the property, and if it is of any great value it might pay him to consult his attorney.

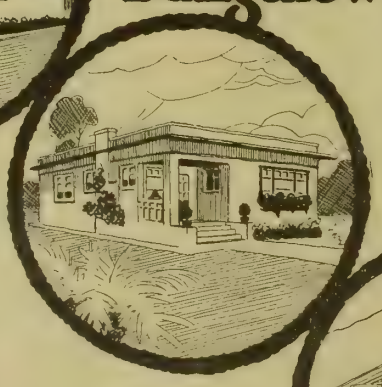
SALES OFFICE: 504 I. W. Hellman Bldg., Los Angeles, Cal.

Avoid Rising Home-building Costs-

Own a California Ready-Cut Bungalow *and* Save $100 to $500



Up, UP go living and home building costs, and down, DOWN goes the cost of owning and erecting a California Ready-Cut Bungalow. Why? Because under this new way of building all waste of both labor and material is entirely eliminated. There's no waste anywhere when you erect a California Ready-Cut Bungalow. You choose the house plan you like best and we supply all the lumber, mill work, hardware, paint, etc., you need at a big saving to you. Materials are supplied cut-to-fit; just enough of each but not too much. No waste anywhere. Mail the COUPON today for complete information.

Right in your own town or neighborhood there are probably many happy owners of California Ready-Cut Bungalows. They were just like you a few months ago. They wanted to own and erect their own homes but heard so much talk about the "high cost of building" that they "put off" just as you are "putting off" building. Then they heard of the California Ready-Cut IDEA, heard how they could have the very house they wanted at bed rock prices with all waste eliminated. They learned that instead of **waiting months** they could live in their house in a **few weeks.** They learned how they could save time, save money and **then** they became enthusiasts for the California Ready-Cut IDEA.

Mail the COUPON today and find out for yourself how we can save you money.

Mail this coupon!

California Ready-Cut Bungalow Co., Dept. "C C 3", 1811 South Main Street, Los Angeles.

Please send me complete information showing how I can save $100 to $500 on your California Ready-cut Bungalows.

PEACH PRICES

The California Peach Growers announces price list No. 6. Please note the following advance in prices, effective Saturday, November 18, 1916, at 6 p. m. All prices are f.o.b. factories, California common points, but no orders will be confirmed by us, at the following prices, unless f.o.b. factories where grades and varieties desired are available. All quotations are subject to our approval of variety and assortment, subject to our confirmation and subject to advance without notice: November, December and January shipment.

Price list No. 5 is hereby withdrawn, and ineffective after 6 p. m. Saturday, November 18, after which time prices herein quoted shall apply.

	Yellows.	Muirs.
Standard Peaches	.06¼	.06¼
Choice Peaches	.06½	.06½
Fancy Peaches	.07¼	.08⅛
Extra Fancy Peaches	.08	.08⅝
Slab Peaches		.05½
Choice Peeled Peaches		.09¾
Fancy Peeled Peaches		.11

Above prices bulk basis.
For 50-lb. bxs., unfaced, add ..... ½c
For 50 lb. bxs. faced, add ..... ⅝c
For 25-lb. bxs., unfaced, add ..... ⅝c
For 25-lb. bxs., faced, add ..... ⅞c
For 10-lb. bxs., unfaced, add 1¼c
For 10-lb. bxs., faced, add 1½c

For prices on graded peaches, original, in bags, add ⅞c to the bulk basis prices above quoted.

	—Per Lb.—	
Ungraded, original bags	.07⅛	.07⅜
Choice Unpld. 1-lb. cart.	.08½	.08⅝
Choice Unpld, 5-lb. cart.	.08¼	.08⅜
Fancy Unpld, 1-lb. cart.	.09¼	.09⅞
Fancy Unpld. 5-lb. cart.	.09	.09¾

	Per Lb.
Choice Peeled 2-lb. Cartons	.12
Choice Peeled 5-lb. Cartons	.11¾
Fancy Peeled 2-lb. Cartons	.13¾
Fancy Peeled 5-lb. Cartons	.13¼

The above prices are guaranteed against our own decline to March 1, 1917, and apply only to sales and shipments made direct to the recognized jobbing trade. No goods will be confirmed at above prices to Coast or Eastern brokers, or to speculators, it being our object to eliminate speculation in dried peaches, we preferring to carry our stock in storage here on the coast until actually required by the jobbing trade.

Citrus Fruit Market

LOS ANGELES, Jan. 31, 1917.

Oranges are going forward at the rate of 100 to 150 cars daily. Fairly good weather prevails in Eastern markets and fruit is moving very satisfactorily. Frosted fruit is still going forward and this accounts for low averages in the auctions and some low sales in other markets. Strictly first class fruit, of which there is plenty, is commanding fair prices.

Shipments

Shipments of oranges from Southern California to date since November 1, 1916, 4911 cars, lemons 1201, total 6142; to same date last year, oranges 3057, lemons 1267, total 4324. From Central California to date this season, oranges 3938, lemons 140, total 4078, to same date last year, oranges 4310, lemons 113, total 4423. From Northern California this season, oranges 842; last season, 597.

FROM THE AUCTION

January 24

New York: Twelve cars navels, 2 lemons, $1.55@3.35; lemons, $2.50@2.90.

Oakland Sensible Six

"Sturdy as the Oak"

Get the *real* thrill of the open road in an *Oakland Sensible Six*. The valve-in-head motor develops full 41 h. p. at 2500 r.p.m.—one h. p. to every 53 pounds of car weight.

And every mile is an easy mile. The big, over-size tires, 32 x 4, the long, semi-elliptic springs, 51″ in rear, 112″ wheelbase, all make the *Sensible Six* one of the most comfortable and easy riding cars of its size ever built.

It has the power, comfort, good looks, reliability you want in an automobile—yet it is sensibly priced — $875, and built to operate at moderate cost.

Oakland Eight—$1585—is a big luxurious 73 h. p., 7-passenger touring car for those who demand the utmost in power, speed and luxury.

OAKLAND MOTOR COMPANY, Pontiac, Michigan

Wizards of Transportation

George Stephenson is rightly called the father of the steam railway. He ran the first successful steam engine on the 25th of July, 1814. In September, 1825, he opened the first railway over which passengers and goods were carried by a locomotive.

The Human Interest In Progress

THE man who is responsible for a system by which the world enjoys safer, easier, quicker and cheaper transportation, is a determining factor in progress.

When George Stephenson started the first locomotive on its way he pushed the world forward centuries. Today we see the automobile with all its possibilities made practical and its energy made effective by the rubber tire.

The leading example of highly specialized and efficient tire service is found in Firestone Non-Skid Tires.

The miles of reliable wear on any road at all seasons, the car-protection and easy-riding, make Firestone Tires a world-wonder in transportation.

And as there is a man-power behind every big work, so this service is vitalized and given the personal element by the name on every tire of the founder and present head of the business, Mr. Firestone. That name on the tire is your assurance of quality.

Your dealer can get Firestones for you, and this quality will cost you no more than ordinary tires. Because Firestone Tires are widespread in use and the output is tremendous and efficiently handled by the Firestone Organization. Your dealer will serve you.

Training the Walnut in the Way it Should Go

J. B. Neff Writes for California Cultivator Readers of Pruning and Shaping the Young Walnut Tree

THE pruning of a walnut tree should begin early in its life, and while it is not always necessary to cut back the single stem that is made the first year this can be done to advantage if the roots have been badly mutilated in removing from the nursery row. The head of the tree should be started at from four and a half to five feet from the ground and formed with three or four branches not starting directly opposite each other nor at the same height. If more are left they will have to be removed later to the detriment of the tree because of the scars which do not heal rapidly and leave decaying wood unless much care is given to keep them covered with paint. The walnut must not have the short pruning usually given deciduous fruit trees and must not be generally headed back at any time.

During the first eight to ten years the necessary pruning will be that which will give proper form to the tree and the removal of all branches turning downward. It is often best to drive a stake two inches square by nine feet long near the tree soon after planting, and by tying the lower branches to the top of this with soft rope they can be trained to the proper place. Do not head back any branch if it can be avoided, but train by cutting back to a branch which is going in the right direction.

When the trees become so large and the growth so thick that the sunshine does not go through the trees they must be pruned or the crop will be small and the nuts undersized. The small branches near the center of the tree will also die and small growth be made. Large nuts and large crops are grown only on thrifty trees, and old trees can be kept thrifty only by vigorous pruning. The branches should be kept thin enough to allow sunshine to show lights and shadows on the ground under the tree. It is not practical to thin each particular branch to its end, but by going back three or four feet from the end and taking out crossing and interlocking branches the desired result can be obtained. Instead of cutting out wood that has already died from overcrowding thin out the branches so those remaining will not die but will produce large walnuts and grow vigorous wood for the next year's crop.

Sap will frequently flow from the fresh cuts. This will not injure the trees but may be of advantage by causing the buds to open a few days later in frosty localities.

Draining Down the Alkali

Experimental Plat on the Kearney Vineyard Property of the University of California. One Hundred and Sixty Acres at One Time of No Value Now Producing Hay Crops

ONCE almost a desert, the lands of small portions of the San Joaquin Valley are becoming salt marshes. Because of subsoil conditions irrigation canals which have brought life to these arid acres are now proving a menace because of the waters filling the soil and refusing to drain away, and worse, "bringing up the alkali". The department of agriculture has engineers and soil experts discussing the question for a decade. Expensive drainage systems have been recommended. It has seemed impossible to get the land owners to provide for the great expense, and the question is continually asked: "What can we do to save these lands at a cost within reach?" Some of these lands are within the boundaries of the great Kearney Vineyard Estate, now the property of the University of California. S. P. Frizelle, manager of the estate for the university, and James Mills, one of the regents of the university, recently gave the editor of the Cultivator a fund of information regarding this estate, and especially regarding the experimental drainage plot which covers a quarter section of the land. Most of the vineyard is still productive and is yielding to the university a handsome sum each year, but many of the acres are entirely barren, being in the lower sections where the soil is naturally richer. The question is asked, "How can they be saved?" On this one quarter section the condition of the land is shown in one of the engravings accompanying this article. This photo was taken January 27. This land was once covered by one of the most productive vineyards in Fresno County. The experiment being tried is that of tiling, and while this particular field is being drained at a cost which is almost prohibitive, lessons are being learned which, if the experiment proves successful, will make possible far more economical draining of other fields. The cost in this case was approximately $100 per acre, and while it is not probable equally as efficient drainage may be given to other fields at half the cost, it is thought that at least $60 will cover the expense per acre.

The plan consists of tile drains, the main drain of which is about seven deep and laid of eight and 12-inch tile. There are eight parallel laterals of six-inch tile, 315 feet apart and varying in length from 500 to 1700 feet. There are concrete silt wells along the main drain about 500 feet apart and at one corner a large cistern or well over which is an electric pumping plant. The method of operation is to flood for a week lands in the basins which are shown in the engravings. The alkali is washed to the lower depths, and the surplus water draining to the receptacle at the lower corner is lifted into the irrigation ditches and passed on to other lands. Chemical tests have been made of this water and it is found to contain only a trace of injurious salts. While the "washing out" of the alkali is the idea in this drainage system, and this has already succeeded to the extent that heavy hay crops have been grown on this particular 160 acres, yet it seems to carry the injurious salts into the lower subsoils.

One other experiment being carried on in the Kearney Vineyard Estate, which is being watched with a great deal of interest, is that of applying sulphuric acid. This we believe is the first effort of the kind. Forty acres of the land were sprinkled with sulphuric acid, which after the rains were cultivated and a crop later planted. This is the first extensive experiment along this line. Small plots were planted last year and the acidulated ground produced heavily while adjoining lands refused to produce any material crop. This experiment may prove of value for these lands when sulphuric acid returns to a normal price. Present prices would prohibit its use. Whether it will completely neutralize the acids, and for a period of years, or whether it will only accomplish temporary results remains to be seen.

Reclaiming Alkali Lands

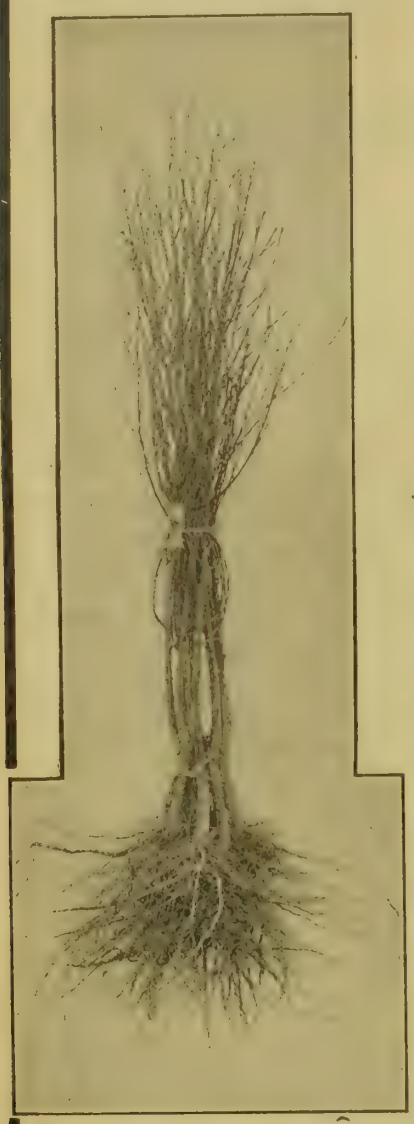
A portion of a quarter section of the Kearney Vineyard in Fresno, now the property of the University of California, which is being reclaimed by drainage. This land was once a productive vineyard, later an alkali marsh because of rising alkali. The university has tiled at an expense of $100 an acre and last year raised a good crop of hay on these lands.

Lifting Drainage Waters Into Ditch

Pumping plant on Kearney Estate, Fresno. Tile from 160 acres enter the cistern or drainage well underneath this pump house. The dikes are flooded to the depth of a foot or more and as the waters settle the alkali is carried to the lower levels. The water reaches the drains and is carried back into the ditch almost as sweet as when put upon the land, and later used to irrigate other lands.

TREES

Established 1888



One Year Peach Trees

Now ready for delivery. High grade nursery stock in

Almonds
Prunes
Peaches
Apricots
Pears
Cherries
Plums
Grapes
Oranges

Nitrate of Soda

Written for California Cultivator By Kenneth MacRae

AT a growers' meeting recently held at the Riverside experiment station Dr. Kelly warned against the use of nitrate of soda for fertilizing purposes, said it was a soil poison, either alone or in combination.

My experience does not agree with Dr. Kelly's conclusions. I have used only nitrate of soda and cover crops on some 100 acres of groves for the past nine years, quantity, quality and condition of both fruit and trees being above the average. In fact, during the nine years I have grown banner crops. I reason that an application of five or six pounds per tree in early spring rushes a strong flow of sap to the tip ends. This enlarges the sap cells, the circulation. Result, strong bloom, strong stems, good color. In fact it sets the crop.

The European nations use nitrogen freely. They claim to average 100 per cent more wheat, oats, barley, rye and potatoes per acre than the United States. Germany alone uses over 2,000,000 tons of nitrates, which it is estimated increases the crops over 63,000,000 tons. According to the Country Gentleman, the concensus of opinion in the South was that peach trees required an abundance of lime, phosphates and potash, but no nitrogen. The Virginia experiment station conducted experiments on three orchards some miles apart. The lime, phosphoric and potash plots showed no beneficial results, while the plots treated with 150 pounds per acre of nitrate of soda increased both tree growth and fruit practically 100 per cent. Certain Oregon apple growers duplicate the Virginia experiment.

A Cultivator article headed "Nitrogen, the Indispensable", reads as follows:

"A long list of experiments, says the author of The Saline Deposits of California, carried out in many places, shows that nitrate of soda is the best source of nitrogen for the orange. Nitrate of soda plays a double role in the soil, besides furnishing the best as well as the cheapest nitrogen for the farmer. The claim long made that it renders the native supplies of potash in the soil available has been proven. A soil containing 0.37 per cent of potash yielded to solution of nitrate of soda 0.11 per cent, or nearly one-third of that potash. When it is remembered how much potash some soils contain, e. g. 1.14 per cent in certain soils in the San Gabriel Valley, the importance of this property of nitrate can hardly be overestimated".

Another Cultivator article gives the following interesting table of values, compiled by the eminent German chemist, Dr. Wagner:

"One hundred pounds of nitrate of soda equals 114 pounds of sulphate of ammonia, 145 dried blood, 149 cotton-seed meal, 156 fish scrap, 164 bone meal, 185 tankage or 312 pounds of barnyard manure." It is regrettable that there is no absolutely proven fertilizing method. Dr. Kelly condemns the use of nitrate of soda. Another scientist states "that it is the best source of nitrogen for the orange." Again, Dr. Wagner's table shows its comparative value as against other sources of nitrogen. The orange grower is at a loss what to do or which to follow.

The late J. J. Hill, the empire builder, conducted experiment farms at central points along the lines of his different railways. He furnished the farmer with seed and land, also paid him for his work. He however demanded results. When some farmer grew more and better crops than the expert the farmer was promoted to the head of the class. He had no use for failures.

To my mind the good work of the Riverside experiment station can be materially improved. It is at present centralized, confined to one town, to one soil. This mitigates against general knowledge. I would suggest that the members of the faculty each take charge of a ten-acre grove in three or four towns. This would diffuse knowledge and enlighten growers. Object lessons is what we should have, and this too in 20 or 30 different localities. This would arouse competition among the members of the faculty, as well as quicken the ambition of the growers.

Humidifiers for Curing Lemons

A SIMPLE apparatus for regulating the humidity in lemon curing rooms has been devised by experts of the United States department of agriculture. The cost of this apparatus, as stated in a new bulletin, No. 494, need not exceed $25, exclusive of an ordinary 16-inch electric fan used in its operation. This small expense would be more than offset by the improved appearance and quality of one carload of lemons cured under uniform conditions of humidity. Furthermore the usefulness of the device in improving atmospheric conditions in dwelling houses in the arid sections has been demonstrated.

The apparatus consists primarily of two water pans placed one above the other, with strips of cloth extending through slots in the bottom of the upper pan to the lower pan. These slots are raised above the water level in the upper pan and the edges of the cloth hang down from them into the water. Capillarity raises the water on the cloths to the top of the slots. From there gravity and capillarity combine to drop it down through the cloths to the lower pan. An electric fan generates a current of air which is driven between the cloths, carrying the moisture from the saturated cloth out into the room.

Founded in 1889 by R. M. Teague

The R. M. TEAGUE CITRUS NURSERIES

Successors to

The San Dimas Citrus Nurseries

Teague Trees are Quality Productive Trees

Because properly grown and budded from selected trees producing abundantly only quality fruit. Buds cut from carefully selected fruiting bud-wood only. In addition we give quality service in the way of digging, packing and delivery that insures success to the planter. Correspondence and inspection invited; our treatise on "Citrus Culture" and annual Price List sent on application.

R. M. TEAGUE, Manager
San Dimas, California

Experiments in a packing house in Southern California showed that by the use of this apparatus the humidity in the well insulated curing rooms could be raised about ten per cent an hour in the range from 70 to 90 per cent of relative humidity. When the relative humidity was below 50 per cent the action of the humidifier was more rapid. On the other hand, with a relative humidity of about 90 per cent, the humidifier worked very slowly, and above 95 per cent the effect of the apparatus was scarcely noticeable.

As designed by the government expert the humidifier consists of two shallow, galvanized steel pans 36 inches long, 24 inches wide and six inches deep. The slots for the cloths are raised four inches above the water level of the upper pan. The cloths themselves are made of Russian crash, a very coarse linen which is used for towels and for decorative purposes. Such a humidifier, it is said, should be sufficient for five curing rooms, each of which is about 20 feet long by 20 feet wide and ten feet high, although the insulation of these rooms will, in a great measure, determine the amount of humidification necessary. For use in private dwellings a much smaller apparatus would be satisfactory.

IRRIGATION INCREASES FOOD SUPPLY

"In these days of high prices, projects for reclaiming desert land and thus increasing the supply of food deserve special consideration," comments Editor Anderson of Irrigation Age. "The area under irrigation in our arid region is now about 15,000,000 acres. In 17 years it has been doubled. This watered land yields $200,000,000 worth of products every year. Water is available for the irrigation of 40,000,000 acres more. Since the passage of the reclamation act 14 years ago the federal government has expended more than $100,000,000 in irrigation work. The money has come from sales of public lands, and those who use the water pay eventually the estimated cost of construction.

"The results of an inquiry about irrigation were published recently by a committee of the United States Chamber of Commerce. All agricultual products, the committee says, can be grown more successfully on irrigated land than elsewhere, the average yield per acre exceeding that of non-irrigated farm areas by from 10 to 50 per cent. There is scarcely any risk of loss. Crops are not exposed to drouth or destructive rainfall. They are not attacked by insects, for the surrounding desert does not breed these enemies. The committee points to the Salt River project in Arizona as a typical example of the excellent work which the federal government has done. There, what was a desert, is now a garden whose products are sold for about $4,000,000 a year.

"It would be profitable for the nation to add to the 15,000,000 now irrigated the 40,000,000 which can in the same way be made equally productive."

In marketing your produce, pack and grade efficiently and honestly in the package that the market demands, and let your name on the package be a guarantee of its contents. Remember that a slovenly package, carelessly and improperly graded and packed, will always bring a price in proportion. Goods put up attractively and carefully and honestly p cked and graded always command top prices.

Care of the Farm Auto

"I have given the workings of the car a good deal of study and will tell you how I care for the machine while it is in use," saye a writer in the Fruit Grower and Farmer, and he adds:,

"First, I am careful to keep the carburetor properly adjusted. This is a very important matter. When I bought the car the carburetor was a great mystery to me until one day the machine stopped with me when 12 miles from a garage. The trouble was traced to the carburetor. I 'dug into the thing,' located the trouble, and remedied it. Since then the carburetor has not been such a mystery. I mention this to illustrate that the best way to get the needed knowledge is to tackle it when anything goes wrong. Be sure to save all the pieces so if you cannot get them back together properly, they will be there for some one else to assemble.

"During changeable weather, that is when one day is somewhat cold and the next warm, it is not an easy matter to keep the carburetor perfectly adjusted; and it is best not to do too much changing, unless one knows his carburetor so well that he knows, without testing, about how much of a change to make. When making a change I keep in mind the number of half turns given the thumb adjustment. Then I know the kind of a change needed for cold and warm weather.

"I watch the oiling system carefully, always using the best grade of oil obtainable. I use only one make of oil, never changing to another. I once changed to a different make, thinking it would make no difference, but soon found the oiling system not working right.

"The cooling system comes in for a good deal of attention. When the weather is warm the engine must be kept cool enough so that everything works well. The water in a water-cooled engine is supposed to be al-

$1150 F. o. b. Racine
For Mitchell Junior—120-inch Wheelbase

Mitchell SIXES

$1460 F. o. b. Racine
For 7-Pass. Mitchell—127-inch Wheelbase

$1150 Model Also Now On Show

See the New Mitchell Junior With Hundreds of Mitchell Extras

Now we invite you to see Mitchell Junior. A somewhat smaller Mitchell—a $310 lower price than the 7-passenger Mitchell. But with generous size and ample power for a 5-passenger car. And with all the exclusive Mitchell attractions, due to John W. Bate.

Another step in Mitchell efficiency appears in the new Mitchell Junior. We urge you to come and see it.

A 7-passenger car, to have ample power and ample room, can't be smaller than the $1460 Mitchell, which has won for itself one of the envied places in the motor world. But 40 horsepower is enough for a 5-passenger car. And a 120-inch wheelbase gives room enough—more than most cars give.

So the Mitchell factory this year also brings out Mitchell Junior. Not a new type—simply a size reduction. So a man who buys a Mitchell can get the size he wants.

Thousands of these new cars have been run for months, on every sort of road. And they have proved themselves as perfect as the 7-passenger Mitchell car itself.

See the New Extras

In both Mitchell models there are hundreds of extra features. They give you at least 20 per cent extra value over any other car in this class.

These extras—most of them exclusive to Mitchells—are paid for by factory savings. They are the result of efficiency methods, applied by John W. Bate.

This great efficiency engineer built and equipped this whole plant. Every method and machine is adapted to producing this car economically. These methods have cut our factory cost in two. Nowhere else is a car of this class built anywhere near so low.

You will be amazed to see how many extras these new-day methods pay for.

Double-Strong Parts

One result is the Mitchell standard of 100 per cent over-strength. That is, every vital part is twice as strong as need be.

The Mitchell standard used to be 50 per cent over-strength. That itself was extreme. The Mitchell car has always been a marvel of endurance.

But, in the past two years, we have doubled this standard to give you a lifetime car. That fact is announced for the first time in the models now on show.

Over 440 parts are built of toughened steel. All parts which get a major strain are built of Chrome-Vanadium, and built oversize. We pay for steels in the Mitchell as high as 15 cents per pound.

31 Unique Features

There are also 31 extra features in Mitchells. That is, features which nearly all cars omit. Things like a power tire pump, reversible headlights, ball-bearing steering gear and never-broken springs.

These extras alone, on this year's output, will cost over $4,000,000. But all are paid for by these factory savings.

Many New Luxuries

Our new body plant gives us for this year another enormous saving. All Mitchell bodies, open and enclosed, will be built in our own shops.

This saving enables us to add 24 per cent to the cost of finish, upholstery and trimmings. The finish coats are now heat-fixed. A rare-grade leather is employed. A hundred new touches make today's Mitchell the handsomest car in its class.

Every Mitchell extra is something that you want. Nearly all are things you don't find in other like-class cars. They are things which can't be given without added price, save under Mitchell methods. Go and see them. Judge for yourself what they mean to you. And see which size you like best.

MITCHELL MOTORS COMPANY, Inc.
Racine, Wis., U. S. A.

TWO SIZES

Mitchell —a roomy, 7-passenger Six, with 127-inch wheelbase. A high-speed, economical, 48-horsepower motor. Disappearing extra seats and 31 extra features included.
Price $1460, f. o. b. Racine

Mitchell Junior a 5-passenger Six on similar lines, with 120-inch wheelbase. A 40-horsepower motor—¼-inch smaller bore than larger Mitchell.
Price $1150, f. o. b. Racine

Also all styles of enclosed and convertible bodies. Also demountable tops.

ways at the boiling point around the cylinder to be certain of best results. It is not supposted to boil in the radiator, but no damage is done if it does, providing the radiator is kept reasonably full, and enough lubricating oil is being used to prevent the pistons from sticking. I use nothing but soft water in the radiator, as scale will not form from soft water. Change the water quite often and thoroughly flush out the water system when changing the water. Exercise care to see that the circulation is not obstructed.

"Of course all gear cases are kept as full as they should be with transmission grease. Besides keeping the oiling and cooling systems working right and the engine up in trim, there is always the tires to look after.

"Tires should be kept fully inflated at all times, but the fact that heat produces a greater pressure must not be lost sight of. I find that a tire that registers a pressure of seventy pounds when starting out, will easily register a pressure of eighty after an eight-mile run over a hot road on a hot day. When the weather is hot and the road is hot, I cut down from five to eight pounds on air carried in the tires, as the heat will soon put that much in a tube. If a tube is patched, there is almost certain to be trouble, for the simple reason that the heat will burn the patches off. For use during warm weather a thorough job of vulcanizing makes the only permanent repair on a tube. Small vulcanizers will do this at very little expense and their operation can be quickly learned. Those who do not care to do this should by all means let a cement patch on a tube be only a temporary repair, having the puncture vulcanized as soon as possible. That is the only way to be free from tires going flat in hot weather, causing delay and disgust with the whole tire proposition.

"Dust and dirt should be kept off an auto as much as possible, as the cleaner it is kept the better it will look, the easier it will run, and the longer it will last. My car receives a good brushing and rubbing with a woolen cloth after coming home from a drive. All worn grease and oil is removed. I have a full equipment of tools, and an especially built garage in which the machine is kept when not in use. My auto is yet in excellent condition, and the expense of upkeep during the three years I have owned it has not been more than half what I expected it to be when I purchased the machine."

Sulphuring Pears

ONE of the addresses at the last state fruit growers' convention at Napa was that of Fred G. Stokes, horticultural commissioner of Lake County. In that address, as quoted in the Cultivator, was the statement that Mr. Stokes, or rather the fruit growers of Lake County, sulphur their fruit for 48 hours, renewing the sulphur three or four times. A pear grower in the southern end of the state wrote inquiring if this were correct, and if so, how the pear growers of Lake County "get by" the pure food commission. The matter was referred to Mr. Stokes and he answers:

"Regarding the sulphuring of pears for drying I affirm the figures given at the Napa Fruit Growers' Convention that we use four or five pounds of sulphur repeated four times during 48 hours of sulphuring. Should the pears be extra ripe we only sulphur 31 hours, when it would be necessary to renew the sulphur at least three times. We have no trouble with pure food experts and ship out several hundred tons of what are acknowledged to be the best dried pears the state produces. We get from two and a half to three cents a pound preferential rates for these pears, and many orchardists dry the entire crop. The sulphuring alone is not what produces this result, but we raise an A1 close grained Bartlett, rich in sugar and exceptionally free from blemish, such as scab, frost ring, etc., and our climate is peculiarly adapted for the curing process, neither too hot nor too cool and with fogless nights. As to the sulphuring having any injurious effect to the fruit consumer, I much doubt it, as from personal observations and experience in dry yards I have noted yearly the same bunch of men working during a season of six and eight weeks continually chewing on pears, the same being in all stages of drying and heavily sulphured. None of these men to my knowledge have been affected by the sulphured fruit and the same gangs show up serenely year after year and repeat the operations."

We may say that a box of these cured pears was exhibited at the Napa convention, and a more beautiful, waxy and tasty product we never saw, but we believe one feature which pear growers must consider is the matter of locality. Every section of the state is not fitted for growing pears for drying purposes, as is Lake County. However for all who would dry pears there is much valuable information in Mr. Stokes' address.

EASTERN FRUIT GROWERS

The annual meeting of the Eastern Fruit Growers' Association will be held at Washington, D. C., February 14-15. National apple grading and packing law, laws to regulate commission merchants, increase in consumption by advertising, marketing problems, United States bureau of markets, farm loan banks and other practical questions will be discussed.

Grow
Large Olives
Plant Trees of the
Ascolano
Variety
The Ascolano (Queen Olive) is THE BEST for ripe pickling: Ripens early and escapes probable early frosts; attains a large size—often equalling a French Prune; is of excellent quality, and on account of its fine large size, attractive appearance, etc., demands fancy prices. The present supply of "Fancy" ripe pickled Olives is thousands of cases short of the demand, hence it is highly advisable to plant trees of the Ascolano variety NOW, and plant them liberally. It will prove one of your best investments.
Can supply FIRST CLASS trees, true-to-variety, at most reasonable prices, trees that are propagated from the best producing "strain" of Ascolanos in the country.
Can also supply high grade
Mission and Manzanillo Olive Trees
propagated from bearing trees having a record for the greatest quantity of highest quality of fruit. In planting an Olive orchard great care should be exercised in securing trees of known origin. You can not afford to "guess" at it. Be SURE. Plant the BEST. Write for present prices on any number of Olive trees wanted in any variety desired.

ASCOLANO (Queen) OLIVES
Free Catalog A Post Card Will Bring It
Can Supply Trees of All Best Varieties of
Peach, Plum, Prune, Pear, Apricot, Cherry, Quince, Nectarine, Fig, Almond, Walnut, Orange, Lemon, Pomelo, Lime, Kumquat, Avocado, Loquat, and all other California fruits. Plant ARMSTRONG trees—the BEST to be had—they cost no more than the ordinary sorts—and will soon prove to be a good investment.

HONEY BEES AND PRUNES

The College of Agriculture has issued Bulletin 274, "The Common Honey Bee as an Agent in Prune Pollination." From its conclusions we note: "That the French prune may be aided in setting a satisfactory crop by the presence of a large number of bees in the orchard during the blossoming period. Without the aid of bees or other insects, the set of fruit on the French prune is often light. The Imperial prune does not seem to be able to set fruit unless pollinated by insects with pollen from other trees.

"It should be stated that, although the crop of prunes on the tree which was under the tent with the bees was much heavier than that on the tree under the tent from which bees were excluded, the size of the prunes was smaller. The prunes were also smaller than the average on the trees not in the experiment. This smaller size was due, no doubt, to the exceptionally heavy crop that the tree was compelled to mature. The introduction of a number of hives of bees into an orchard would not necessarily mean that as heavy a crop of prunes would be produced as resulted with the tree in the experiment under the tent. It is only reasonable to suppose that the bees flying some distance from the hives would have less effect on the setting of fruit in the orchard as a whole, than did those whose efforts were confined to but two trees.

"Since the results of the experiment have become known, considerable discussion has arisen as to the best method of testing out the work of bees in the various sections. Some growers are preparing to purchase a number of swarms of bees to have them permanently in their orchards; others expect to try to keep the bees in the foothill sections for most of the year, bringing them into the orchards during the blossoming period only; while others expect to try the plan adopted in parts of Southern California, where bee-men having large numbers of swarms are hired to place their bees for a certain length of time in the orange groves. It seems to be the consensus of opinion that the best work would result if the bees were brought in from some outside district and scattered about the orchards, about one hive to the acre, during the blossoming period, and then removed. Some of the growers are at present giving the latter plan serious consideration.

"The results of this experiment, while interesting, do not necessarily solve all of the problems involved in pollination, but serve to throw some light on this one side of the question. It is the purpose of this division to repeat this experiment in whole or in part and in connection with other experiments now in progress, the station may be able to give further light on the question from time to time."

AFRICAN FRUIT GROWERS ADOPT MARKETING PLAN

By Consul John P. Bray, Johannesburg, South Africa

A description of the manner in which the United Fruit Growers' Association of Johannesburg intends in the future to dispose of its products is given in the Johannesburg Star. The subject is of interest to the fruit growers of the United States. On account of unsatisfactory conditions under which fruit has been marketed in Johannesburg during the past few years the association obtained quarters for its own use, and those who desire to purchase direct from the producers will have an opportunity to do so. In discussing the plans the newspaper states:

The company intends to cater to the wholesale buyer, and there will naturally be a lower price to the man who buys in wholesale quantities for the purpose of selling again than is charged to the purchaser of a single box or basket. The company will probably sell by auction every morning from about 7 to 9 o'clock, and much the same system will be adopted as is in force on the local market. Buyers of single boxes or baskets will be given an opportunity to obtain what they require, and the wholesale buyers will naturally be able to obtain their supplies at lower prices. During the remainder of the day fruit will be sold out of hand. Bulk will not be broken; that is to say, not less than a box or basket will be sold to any purchaser. Later on the company hopes to establish a system of delivery to the suburbs.

In order to share in the distribution of profits consignors must be members of the Transvaal Fruit Growers' Association. The company has been formed solely for the purpose of securing the whole of the profit to the grower, provided such a grower is a shareholder in the company and a member of the Transvaal Fruit Growers' Association. There are no vendors or underwriters; no shares will be issued at a discount; nor will any commission or brokerage be paid to anyone. No director has any interest in the promotion or formation of the company. The directors will not be entitled to any directors' fees, except such as may be voted by the shareholders at the annual general meeting. In so far, therefore, as it has been possible to secure the formation of a company which will be solely for the benefit of its members and customers this has been done.

—QUINCES—

Plant Roeding's

WALNUT TREES

For Profit

Walnut growers have prospered in California. The owner of a good walnut orchard has been the envy of his less fortunate neighbor. There are thousands of acres in our great valleys and along the coast that are suitable to walnut culture.

We have a splendid stock of young, thrifty, grafted walnut trees of the best types, and urge prospective planters to place their orders at once as the quantities on hand of some varieties are getting limited.

The Pecan
Another Valuable Nut

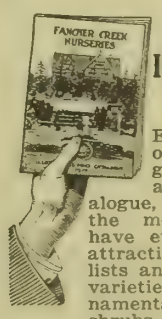
In addition to the Walnut, the Pecan is going to prove a most valuable acquisition to our list of nuts.

Nectarines

We recently called attention to the growing demand for Nectarines, and we want to again emphasize the importance of planting Nectarines. Write to us for prices and best varieties to plant.

Persimmons

More and more importance is being attached to the Persimmon as to its value commercially. It is a fine fruit, and should be planted more extensively. No garden or orchard is complete without persimmons, so be sure and include them in your order for trees.



Get Our Big Illustrated Price Catalogue

Every fruit grower or prospective fruit grower should have a copy of our catalogue, which is one of the most complete we have ever issued. It is attractively illustrated; lists and prices over 2000 varieties of fruit and ornamental trees, vines, shrubs and plants. This book contains a lot of valuable information which every grower should have. If you haven't already sent for a copy, do so today.

Art in the Garden

Written for California Cultivator By E. Braunton

THE day has passed when the individual no longer cares what the world says about his home and holdings. In the old days, with almost no roads and ox teams or riding horses the only means of communication, little attention was paid to appearances for few came to view. But in this era of perfect roads and the best and quickest means of transportation thousands view one's premises where but one saw before, and the universal demand is for beauty and art.

It may be well to concede that all plant life is beautiful however placed or misplaced and that place is usually the least attractive that contains the fewest plants. But this is not always true. A hopeless, pathless jungle may be a thing of beauty in nature, but in a garden would be so useless as to constitute a nuisance and a menace. Here is where the gentle art of gardening steps in to construct the happy medium. More and more is the landscape architect being called to plan or supervise the laying out of home grounds, and while in the past his activities have been most marked in the city, in California the country homes bid fair soon to surpass the best of those in the city in point of attractiveness and real comfort and entertainment.

Caution to Amateurs

Many modest gardens of great beauty have been planned and built by amateurs. But in garden planning and planting, as in all else, the novice thinks he must produce the unusual or he has failed. But this idea carried out in the garden is fatal to beauty, art, comfort, in fact everything that a good garden should stand for. We must lose sight of effect, largely, and strive to build simply, actuated at all times by our needs. There is no dignity or art without simplicity. It is well for the amateur to know what to avoid rather than what to do. He will usually do all that is necessary and almost invariably will overdo.

Styles of Gardening

Do not be led away by any "style" in gardening. No one style can be made to harmonize with all kinds of situations or with all styles of architecture. Study your ground and its apparent needs. Then consider your personal needs and your desires and plan and plant as nearly as you may with all these allied interests in mind. You will be urprised what a satisfactory garden you may build. Stand away from your house and grounds, out in front, and see if some disposition as to plan and planting does not suggest itself as the main theme to follow. Robinson, the highest authority, says every place invites plans for itself only.

Propagating Shrubs

This is a fine time to propagate deciduous flowering shrubs from cuttings. I have seen material cut from shrubs with pruning shears, stuck in the soil in bundles to await time for making cuttings, forgotten, and nearly all grew. But lilacs, bridal wreath, deutzias, wigelias, lemon verbena, and all that class may be cut into cuttings with a good sharp knife, inserted in the soil for three or four inches, kept damp, and nearly all will grow. No need to buy such plants or to get along with but one in your garden when you may have scores. Do it now.

Acacias for Flowers

In the Eastern states acacias are grown for flowers alone, which is never the chief consideration in California. However, some attention may be paid, among those fond of a variety of plants, to this class of acacias. The best one is a dwarf species, not yet common, known as Acacia pubescens. Next comes A. podalyraefolia, not common here, but handled by nearly all dealers and a real gem. Of the sorts most common with us A. longifolia yields the finest crops. The flowers do not come in globose bales as is nearly always true but in catkins like unto the pussy willow.

Divide Perennials Now

Old clumps of golden rod, golden glow, perennial asters, sunflowers and all that class may now be divided and replanted and will yield perhaps a hundred fold over the flower crop of last season. Good crops of flowers are seldom borne on old matted clumps. A little later division should be made of cyperus, papyrus, elephant's ears and those plants which luxuriate only in hot weather. It is still a little cold for such plants and for dahlias, 'mums and a few others. But early in March all should come to the slaughter and be torn to pieces for the new and better life that awaits them in the coming summer.

FIGHTING MILDEW ON ROSES

Very general complaint has been made of roses mildewing through the past summer. This mildew has resisted copious and frequent applications of flowers of sulphur. The United States department of agriculture recommends for this trouble fall spraying with lime-sulphur or potassium sulphid. After cutting back in the fall, the plants should be sprayed with lime-sulphur or strong Bordeaux mixture. The control sprayings for rusts should be ammoniacal copper carbonate. The fall spraying should be with a strong Bordeaux mixture. For leaf-spot, leaf-blight and anthracnose, the control sprays may be either Bordeaux mixture or ammoniacal copper carbonate, and the fall spraying should be with the former.

Questions and Answers

ANSWERS BY EDITOR AND STAFF

Questions to be answered in this department should be received at this office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Perhaps Chicken-pox

I have some chickens hatched last March and also some a year last November. They laid well up to September and November ones even through the molt. Since then neither lot has laid any eggs to amount to anything. Feed is dwarf milo (evenings), dry mash, milk and all the free range they want in orchard planted with barley. They have small black blotches on their combs like fur and lobes very yellow, otherwise seem healthy, and droppings natural. Neighbors complain of same trouble.—Subscriber, Klink.

Is it possible that your flock and those of your neighbors have been suffering from a mild form of chicken-pox? The sores and scabs in chicken-pox are usually yellow or grayish-yellow and cover the head as well as the comb, but a mild attack of this disease does not affect the health, and it should run its course in two or three weeks. If I were you I think I should treat for chicken-pox. Anoint the combs with carbolated vaseline and give a dose of calcium sulphide all around daily for a week. The dose is one grain for each full grown fowl. Mix it in a wet mash and see that the drug is thoroughly distributed through the mash so that each bird gets its share.

It may be that some of your hens have molted late. March hatched pullets often do molt in the fall. This would account for part of the falling off in egg production. A variety of grains is better than one single kind at all meals. Why not try sprouting seed barley for the morning meal? Soak overnight, then spread out on the bottom of a box or tray and cover with burlap. It will sprout in four or five days, and when fed as soon as the green sprouts show serves as both grain and green feed. The dry mash also should contain a variety of ground grains with about 15 per cent good beef scrap unless the birds have all the milk they will eat, when the beef scrap may be considerably reduced. See that they have all the green feed they will eat every day. Green feed is one of the best encouragers of egg production. Of course they may get enough in the orchard, but then again they may not. Leghorns would, but some of the heavy breeds are too lazy to forage for their green feed when it is right before them. That is where the sprouted grain is so useful.—J. A. K.

Peas for Glenn County

Answering inquiry as to best variety of peas for growing in Glenn County A. R. Gould says:

"If it is proposed to grow peas very extensively and to supply the canners, Alaska is the most popular and is exactly suited to severe weather and will even stand a very wet season. However a comparatively new variety known as Little Marvel, is a heavier cropper and when better known will become popular we think with the canners and would also be the leader in the market and if grown in a fairly warm location would come in early. The most vital point to consider when growing peas commercially is to sow early and select a warm location, say a hillside, as peas put on the market by the first or second week in March command the highest price. Personally the writer would have no fear of being able to secure large prices for any of the varieties mentioned in the monthly notes if he were able to get them into the market early enough, and this should be the main object if they are grown as a commercial crop as there would also be less risk of having them destroyed by aphis, which is a chance all large growers take."

Budding Peach Trees

What is the best method of budding peach trees and when is the best time?—Subscriber.

We take it the subscriber is inquiring as to nursery stock for bearing peach trees are seldom budded or grafted over into other varieties. For nursery stock fall budding is more common. If done in the spring it should be any time after growth has begun and the young plant is filled with sap, or perhaps more common is the grafting of the stock while dormant just before starting spring growth.

Dip for Goats

Kindly give formula for making a dip where tank is used for dipping goats for lice. How long should the goats remain in the liquid in order to be effectual in killing all the lice?—Subscriber, Pasadena.

Perhaps the simplest is one of the commercial coal tar dips. They are mixed in water, and a two or three per cent solution is considered effective. Tobacco dip, lime-sulphur and arsenic dips are also used. Where the tobacco dip is used it should not be in strength over .05 nicotine. Specific instructions are given on wrap of tobacco extract container. Where one has the tobacco stems or leaves a nicotine dip may be made by taking 21 pounds of good prepared tobacco leaves for each 100 gallons of dip required. Soak the leaves in cold or lukewarm water for 24 hours in a covered pot or kettle; then bring water to near boiling point for a moment, and, if in the morning allow the infusion to draw for an hour; if in the evening, allow it to draw overnight; the liquid is next strained (pressure being used to extract as much nicotine as possible from the wet leaves) and diluted to 100 gallons. This dip should be used as fresh as possible as it contains a large amount of organic material which will soon decompose. The animal should be kept in any of these dips only long enough for liquid to penetrate to the skin.

Wax for Tree Wounds

Please give best wax for using where large limbs are cut or bark has been bruised.—Subscriber, Fresno.

There are several different forms of tree wax, some requiring heat to fit them for use; others in the form of a

No Other Six Resembles Hudson Super-Six

Don't Be Misled—It Is a Hudson Invention

Sixes have come into renewed popularity since the Super-Six won the top place. But the Super-Six invention—controlled by our patents—added 80 per cent to the six-type efficiency. And that 80 per cent is what gave it supremacy, when the V-types threatened to displace the Six.

Late in 1915, remember, the Six was a waning type. Even the Light Six, which Hudson gave first rank, had revealed some vital engineering limitations.

It had not solved the problem of motor vibration. It had not minimized friction and wear. Its endurance had proved disappointing.

Sixes at that time held hardly a single record. They were mostly held by Fours.

And leading engineers, including the Hudson, were seeking a remedy in Eights and Twelves. At that time the Six, for high-grade cars, seemed verging on displacement.

What Saved the Day

It was the Super-Six invention, remember, which then saved the day for the Six.

Hudson engineers discovered the shortcoming. By a basic invention they corrected the fault. They ended nearly all the vibration. They doubled the motor's endurance. Thus they created a motor which has since won all the worth-while records.

But that doesn't mean that the old-type Six is any better than it was.

'Twas the Super-Six That Won

The Super-Six, in a hundred tests, has out-performed all other motor types. It has not merely broken records. It has made new records which, a year ago, no man considered possible.

It broke the 24-hour endurance record by 52 per cent. It broke the transcontinental record twice in one round trip. A Super-Six touring car went from San Francisco to New York and back in 10 days and 21 hours.

It beat twenty famous rivals up Pike's Peak. It broke all stock-car speed records, and all for quick acceleration.

Then, after 7,000 record-breaking miles, it showed itself in new condition. Not a part or bearing showed evidence of wear.

No other motor ever built has shown anywhere near such endurance.

All By Saving Waste

The Super-Six develops no more power than other like-size motors. It simply delivers more. It almost eliminates motor friction and wear by ending nearly all the vibration.

That vibration, which wasted power, was the great fault of the Six. It is that which led to the Eight and Twelve as a possible solution. Any motor in which that fault remains can't compare with the Super-Six.

A New Gasoline Saver

The Hudson Super-Six, in endurance and performance, stands foremost in the world. The new style bodies which we have created make the car look its supremacy. A new exclusive feature—a gasoline saver—gives it this year another advantage.

It now outsells any other front-rank car. It has 25,000 enthusiastic owners, who know that no rival can match them.

You can prove in one hour, at any Hudson showroom, that this car deserves its place. And that no other car, at any price, can be classed with it. Do that before the spring demand overwhelms us.

varnish or shellac to be applied cold. Those more generally used are made of tallow, rosin, beeswax and possibly linseed soil. This formula is given in Bailey's Cyclopedia of Horticulture: "Melt together one part of rendered tallow, two parts of beeswax and four parts of resin. The melted liquid is poured into a pail or tub of water, when it immediately hardens. It is then pulled until it is light colored and develops a grain. It may be put away for future use as it will keep indefinitely. When used the warmth of the hands will cause it to soften. The hands should be greased to prevent it from sticking."

Grape for Arbor

What is the best grape for arbor? Does the Mission do well?—Subscriber, Pasadena.

The Mission is as a rule not satisfactory; it is not long-lived, at least not in some sections. Where the grapevine is desired merely for ornament and not quality of grape the Le Noir is perhaps the best. The Concord, the old-time Eastern grape, does well as a rule, and a more luscious grape it would be hard to find.

Fumigating Beans

Will you please tell me through the Cultivator what gas to burn to destroy parasities in dried beans and in what proportion?—Subscriber, Los Angeles.

Insects in beans are controlled by the use of carbon bisulphide, but keep fire away from it. The carbon bisulphide comes in liquid form and vaporizes when exposed. It is highly inflammable and should not be approached with lighted lantern, cigar, etc. Beans should be placed in air tight bins and the carbon bisulphide poured into shallow dishes and placed on top. As the gas vaporizes it sinks through the beans till it reaches the bottom of the bins as it is heavier than air. It should be used at the rate of three pounds to 1000 cubic feet of air space and beans should be left with the gas in the closed container for 24 to 48 hours to destroy the insects.

Cutting Alfalfa

Have any of your readers had any experience in cutting well cured alfalfa with an ensilage cutter and blowing it into a barn? What kind of feed would this be for horses, cows, calves, etc. Would hay, cut fine this way, keep all right if well cured and be all right for stock fed on it?—Subscriber, Tulare.

It is thought by many to well cover cost of cutting alfalfa hay which is often mowed away as suggested by the inquirer with the pneumatic blower. We ask any subscribers who have had experience to give as to their methods of handling. Stock will eat this feed much cleaner than uncut hay.

Relinquishing and Maintaining Filing Right

May one who has filed on desert land relinquish this land when it is shown that he is unable to secure water with which to prove up and in so doing maintain his right of making another filing? Also may he file homestead claim?—Subscriber.

Alex. Mitchell, receiver of the Los Angeles land office, writes: "Relinquishment of a desert entry places the claimant in position to file a second desert land entry, providing he receives no consideration for his relinquishment above the filing fees and improvements that he may have caused to be placed on the land." One may also file a homestead claim under certain restrictions. For full information on this point write to your nearest land office or to General Land Office, Department of the Interior, Washington, D. C., for Circular No. 354, "Second Homestead and Desert Land Entries."

Fine Coat on Horse

How can I maintain glossy coat and best appearance of driving horse?—Subscriber, Pennsylvania.

Thorough grooming of a horse is essential to its health and appearance and calls for almost constant or at least regular attention. The work may vary from simply using the bare hand and arm to the use of the vacuum cleaner and brush. There is always more or less dust picked up in ordinary work, also there are cast-off par-

ticles of skin which should be removed. In warm weather, especially with white horses, a water bath is sometimes advisable. We have seen light-colored horses thoroughly sudsed with good castile or a standard white soap, then rinsed with hose and allowed to stand in sun for a short time, when coat is rubbed down with dry cloths while still moist. Some object to the use of sharp metal currycomb, especially in the case of a sensitive horse. With such horses the currycomb should be dulled with a file, and great care used in loosening the dandruff. Besides the currycomb, if it is used, there is necessary a bristle body brush, rub rag, sponge, wisp, etc. Where the currycomb is used it may be used "the reverse way" of the hair, following with brush and finally the cloth. Some go so far as to clean and polish and finally shellac or varnish the hoofs. This is really objectionable for a well cleaned hoof is far more beautiful. Never use the currycomb below the knees and hocks. Only the brush or a soft rag should be used. Of course the trimming shears should be used around the feet and sometimes on forehead. Of course some especially long coated animals may be clipped. The use of the vacuum cleaner is not so generally adopted but it enables very rapid and very satisfactory work. Of course the first essential of a good coat on any animal is thoroughly healthy physical condition. A plentiful feed of oats with light feed of oil cake meal is thought by some to aid in glossing a coat.

Spraying Apples

How should I spray my apples to keep them from being wormy?—Subscriber, Tulare.

Use a good neutral lead arsenate, six pounds to 100 gallons of water. As soon as the blossoms fall spray again at intervals of ten days to two weeks through the early part of the season. Use right angle delivery of nozzle so as to throw spray into blossom end of the fruit as much as possible. There will be more regarding this in the columns of the Cultivator near the spraying season.

Grain Mixtures for Brood Sows

Could you please tell me in what proportions to mix the following feed stuffs for brood sows carrying pigs: Alfalfa meal, beet pulp and shorts, mixed together and soaked in water, or can you suggest a better and more economical combination that will answer the same purpose?—Subscriber, Laguna Beach.

This query was referred to Prof. F. W. Woll who answers: "I would suggest two parts of shorts to one each of alfalfa meal and beet pulp, all by weight. If shorts are considerably higher in price than the two other feeds, as they are likely to be, somewhat more beet pulp will make a cheaper grain ration, say two parts each of shorts and beet pulp and one of alfalfa meal. In feeding brood sows it may be that a mixture of equal parts of the three feeds will give as good results as either of the grain rations given, and this latter will very likely be the most economical combination in which the three feeds can be given this season. The objection to feeding a large proportion of alfalfa meal to pigs or brood sows is that it contains nearly 30 per cent of fiber, against about 17 per cent in beet pulp and six per cent in shorts, and the digestive apparatus of swine is not as well adapted to getting the full nutritive effect of feeds high in fiber as is that of the ruminants, like cattle or sheep."

Sand Over Soil

Have rich, damp adobe soil covered three feet deep with sand from floods of three years ago. Will rye grass do well planted on this sand?—Subscriber, Arroyo Grande.

Presumably not, that is, grass roots would not penetrate below three feet of sand.

Drowning Out Bermuda

Touching upon the drowning out of Bermuda grass where it has become a pest, a subscriber at Thermal, Riverside County, Mr. L. D. Mallory, writes: "When the Salton sea filled up it covered a field of Bermuda grass which remained under water for four

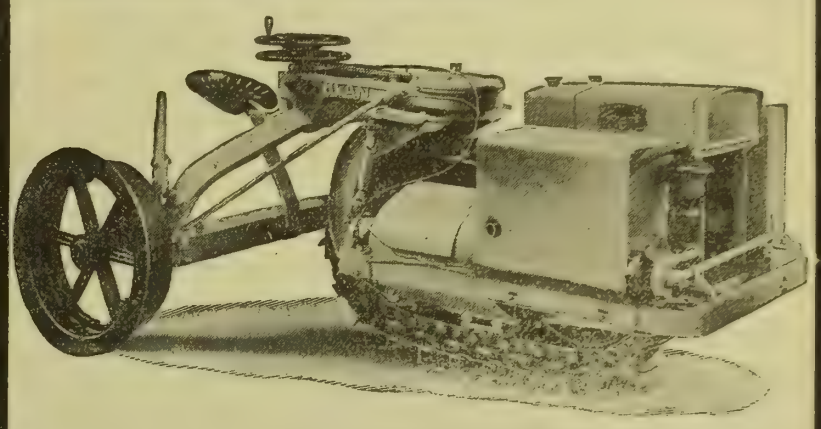
Only $975 If You Order Now

Don't Use *Costly Horses* Any Longer For Orchard or Vineyard Work. This 2800 lb. TrackPULL Tractor Does the Work of *Six* Horses for What *Two* Horses Cost to Keep. Only Tracklaying Type Selling Under $1800 That Will Work Satisfactorily in Orchards.



You can do two things to make you earn more money—increase your yield, or decrease your operating cost.

Now comes a wonderful little tractor to help you do BOTH—a tractor built by the makers of the famous Bean Sprayer outfit.

Only 2800 lbs. weight means an upkeep cost reduced to the minimum, yet **patented construction** provides a **six-horse traction!** Great combination! — a **two-horse** upkeep cost, **six-horse** pulling power, and a buying price of **only $975 cash** (if ordered now).

The BEAN TrackPULL plows up within an inch of the vines in a vineyard without breaking off young shoots. Goes under tree boughs only four feet off the ground (where no horse can go) in an orchard. Gets into the corners. Turns inside a 10-foot circle. Pulls instead of pushes itself over the ground and pulls as strong on turns as on the straight-away. "Gee's" and "haws" like a team. **Pulls** out of soft spots instead of digging in deeper. Works 10 hours a day at full speed if necessary, never tiring, and **eating only while working** and making a **profit** for you. Powerful motor runs stationary machinery when tractor isn't in the fields. Why do without such a producer?

Considering what the BEAN does it's the **lowest priced tractor in the world** at almost any price. Get in touch with us today.

BEAN TrackPULL Tractor

Send This Coupon Now

Get complete information in big illustrated folder by mailing this coupon, which will also bring information as to where you can see one of these great little machines. Sending coupon doesn't obligate you in any way. There's a big demand for these tractors. You must order one well in advance of the date you want delivery, so send coupon at once.

Growing Milo and Egyptian Corn

THE good results which have come from feeding various sorghum grains to live stock, and especially in the making of beef, pork and eggs, are attracting so much attention that we have asked the division of agronomy of the agricultural college for the latest information regarding planting and growing of these grains. B. A. Madson of the university farm gives an outline of the best methods. Unfortunately the state has no bulletin or other publication on this subject.

B. A. Madson

"These crops should be planted from about the middle of April to the first of May. The usual method of planting is to drill them in rows three and a half feet apart with the plants from four to eight inches apart in the row, depending upon the character of the soil and the amount of moisture available. These rates of planting will require from five to seven pounds of seed per acre. The depth of planting varies with the character of the soil and with the condition of the seed bed. If the seed bed has been well prepared with a shallow mulch on the surface, planting to the depth of two inches will usually be sufficient to bring the seed in contact with moist soil. If the seed bed is rough and the surface dry to a considerable depth, deeper planting will be necessary, but it is probably never advisable to place the seed at a greater depth than four inches.

"After the crop is planted if the soil tends to crust before the plants appear, the field may be cultivated either with a harrow or Dunham roller in order to break this crust. When the plants attain sufficient size so that the rows can be plainly seen they should be given a rather deep cultivation, using an ordinary corn cultivator. This implement will stir the soil to a considerable depth, providing a deep mulch and at the same time destroying the young weeds. Two or three similar cultivations during the growing season, or until the plants head, is usually sufficient.

"These crops are grown in a great many sections of the state without irrigation, although where the rainfall is less than 12 inches and irrigation water can be provided, it is usually much better to irrigate. Two irrigations during the growing season are usually sufficient, the first application of water may be put on at any time when the plants exhibit a particular need for it. The second application, however, should be given about the time the plants start to head in order to maintain rapid growth during the fruiting period.

"Milo and Egyptian corn should not be pastured early in the growing season as in this process the plants are apt to be totally destroyed. In growing a grain crop it is a much better practice to force the plants to full maturity as rapidly as possible.

"Harvesting is usually done by cutting the heads by hand when they are fully ripe and spreading them out on the ground or on a layer of straw to cure. This curing process will require about ten days and is absolutely necessary as green or damp seed when placed in a bin will heat and spoil very quickly.

"When the heads are cured threshing is done with the ordinary grain thresher, the only modification necessary is a reduction in the speed of the cylinder to prevent the cracking of the grain."

Soil Requirements of Sugar Beets

By Prof. G. E. Bensel, Consulting Agriculturist in Sugar

IN the early days of sugar beet culture it was generally accepted that sugar beet crops required a soil of heavy nature and that no successful crop could be raised on land of light texture.

The area cultivated to sugar beets was originally limited to heavy loams, but on account of the rapid growth of the industry and the fact that farmers learned more and more of the indirect benefits derived from its culture, it extended its limits far beyond the class of heavy soils, and at the present time, I dare say, beet crops are raised on rich sandy loams and that even very sandy soils are growing good, profitable crops of sugar beets, providing these lands are in a high state of cultivation.

Lands of high producing power, regardless of their physical nature, are adapted for sugar beet culture. Profitable sugar beet crops are grown on all types of soil, from the heaviest loams to the lightest of soil, as well as all the intermediate types.

By land of high-producing power is meant soils of a high fertility. The word "fertility" means in the broad sense the presence in the soil of those conditions which are necessary to the growth and development of plant roots. A fertile soil is one supplied with moisture, with humus and plant food; a soil which is well ventilated; which is sanitary and well supplied with germ life—these five requirements are essential, and if one of these factors be deficient, the yield and quality of the sugar beet crop will be considerably reduced.

Water-Holding Power

Considering the fact that a sugar beet crop of average composition contains only about 20 per cent of its total weight in dry matter, scientific data show that a ton of dry substance requires about 300 to 600 tons of water, which, calculated on a 20-ton crop, means from 1200 to 2400 tons of water per acre. As one inch of rainfall, or one acre-inch of irrigation water, represents 100 tons of water, we must realize that a full crop of sugar beets will require from 12 to 24 inches of rainfall, depending greatly on the nature of the soil and its distribution over the period of vegetation.

Soils of a heavy nature have a greater water retaining power than the light soil, but this missing quality can easily be overcome by increasing the humus content; a light soil rich in humus will retain the moisture providing its texture is not too coarse and does not contain any gravel. The most important point to consider is the internal surface of the soil; the more of this total area it is possible for bee roots to grow upon the more wate and food they will obtain and the larger and more vigorous will the root system become. The great problem confronting the sugar beet growers is no only to fill the soil with water bu having a moderate amount of water, t conserve that water. There should b more cultivation and surface mulchin and less irrigation; there should b

more organic matter furnished the soil, either from barnyard manure, green fertilizer, beet tops, or other forms, thus giving the soil a larger water-holding power.

The water-holding capacity is one of the most vital points to be considered in the selection of sugar beet land.

Humus or Organic Matter

In the past not enough stress has been laid on the humus content of beet land—if a soil is deficient in this element it is very advisable to have organic matter incorporated into the soil before the land is cropped to sugar beets.

Humus (which is decaying vegetable matter, sponge-like and porous) has the power of absorbing and holding large quantities of water. If a soil is supplied with vegetable matter it will grow a much better crop of sugar beets than soils deficient in this ingredient.

A soil well supplied with humus is a soil rich in nitrogen; humus forms acids which will liberate large quantities of dormant plant food. It is the humus of the soil in which the bacteria (which make up the important germ life, an essential factor of fertility) live. By keeping the sugar beet land well supplied with humus we are, to a certain degree, controlling the moisture factor, the plant food factor, the ventilation factor and the germ life factor of the soil. I consider the moisture factor the most important to the beet grower, for it is the one most difficult to control. The water retention power of the soil varies with its physical composition. Experiments have shown that 100 pounds of sand will hold 25 pounds of water after having been filled until it would hold no more; 100 pounds of clay will hold 40 pounds of water; good sugar beet land will hold about 50 per cent of its weight; 100 pounds of humus will retain 190 pounds of water.

If raw land is deficient in humus, green fertilizing crops or beans (or even cover crops) should be raised before a sugar beet crop is attempted.

To sum up, I will say that the most powerful agent at our command controlling fertility is decaying vegetable matter or humus. The source of this decaying matter for the average beet grower is a leguminous crop that takes nitrogen out of the air and thus enables us to put new nitrogen into the soil.

Plant Food

The third important factor, considerably influencing the producing power, is the amount of available plant food. There are about ten different and absolutely essential elements of plant food, and if one of these is withheld not even a pound of sugar beets can be grown to the acre. Every one of these ten elements is positively necessary to the growth and maturity of the sugar beet. Two of the ten elements come from the air—carbon and oxygen—they are taken through the leaves in the form of carbon dioxide. One of the ten elements comes from water— hydrogen. But seven of them come from the soil—these are: sulphur, iron, calcium, magnesium, potash, nitrogen and phosphoric acid. The first two do not need to be given special consideration. Iron is contained in all soils in such abundance, and sugar beets require so little that it has never been found necessary to supply it to the soil. The first element (sulphur in the beet juice) has been detected, but how much is absolutely necessary we do not know as yet. The next two elements are calcium and magnesium. Calcium is an important element but magnesium can be considered of secondary importance. The three last elements which are the most essential are potash, nitrogen, and phosphoric acid.

Drainage and Ventilation

In order to secure these conditions, the soil must either have a good drainage, natural or artificial, secured by open ditches or tile drains. Through drainage the soil warms up sooner and to a greater depth, on account of the removal of the water. As the surplus of water is drawn out of the soil, air enters and ventilates the soil. As soon as the water level is lowered the roots grow deeper. Drainage not only removes the excess water from the soil but also increases the available moisture because it enables plant roots to penetrate deeper.

Sugar beet soil should be sanitary; by this is meant it should have the proper amount of moisture, and no more, and should have a good air supply as a sugar beet breathes in the same manner as human beings.

Beneficial Bacteria

Last, the soil should be well supplied with beneficial bacteria as the crop producing power of a given soil increases with the activity of the germ life.

If we want to get the highest yield of sugar beets we must see that the above requirements are fulfilled. If any of these conditions are lacking the yield and quality will be considerably affected. Undoubtedly all the land cultivated to sugar beets at present does not have the qualities described but should be, at least, of such a character that the missing quality can be easily supplemented either by direct application of manure or by the proper soil improvement, as drainage.

History of Patrons of Husbandry

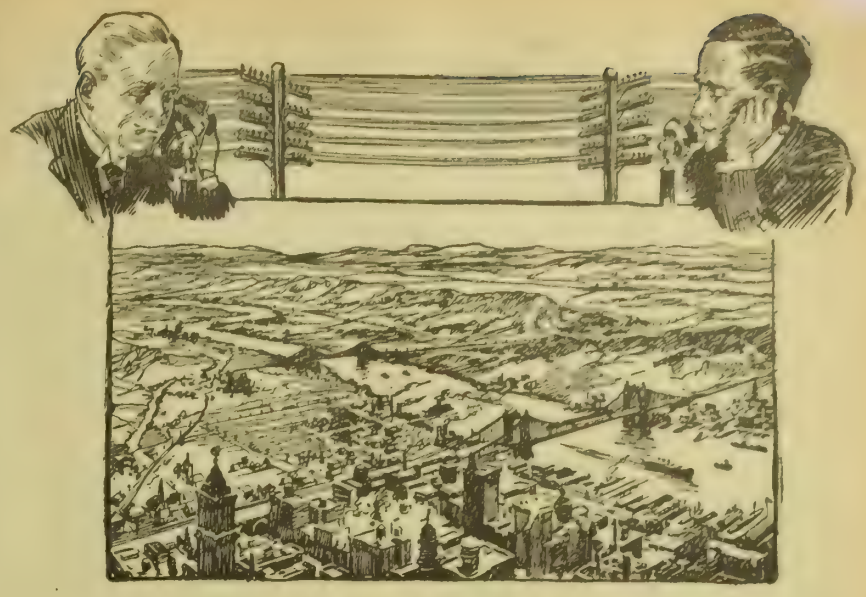
The Semi-Centennial History of the Patrons of Husbandry, by Thomas Clark Atkeson, master of West Virginia State Grange and past overseer of the National Grange, published by Orange-Judd Company, New York.

"At the close of the first half century of the existence of the Order of Patrons of Husbandry, it seems entirely appropriate that someone should write a Semi-Centennial History of the Order. The author has but little inclination to undertake such an important and responsible task, but having collected a mass of material bearing upon the history of the Grange, and having been urged by many members of the Order to do so, I decided to go through this material and arrange it for publication.

"First and last, much has been written about the Patrons of Husbandry, the Grange, and the 'Granger Movement'; but, aside from what has appeared in the newspapers and magazines and in the state and national Journals of Proceedings, nearly all this writing has been confined to the formative period and the decade from 1870 to 1880, and many of these writers seem to have reached the conclusion that the Patrons of Husbandry disappeared about 1880."

There are 28 chapters in the book, reviewing the accomplishment of this great organization and giving sketches of many of those responsible for its great work.

There is also an appendix containing a list of all the officers of the national association from time of founding to the present.



A Bee-Line to Everyone

Straight as the bee flies and quick as though caught by lightning the voice in the telephone carries near and far over this Nation.

This marvelous instrument is the pre-eminent vehicle of speed and speech. Railroads cover the country, but your traveler often must alight with bag and baggage and change trains to get to a given point. Railroads reach cities, towns and villages. The telephone reaches the individual.

The telephone offers continuous passage for the voice and unbroken connections to the uttermost places because it is a united System co-ordinated to the single idea of serving the entire people of this country.

It has been a powerful factor, along with the transportation systems, in the magnificent achievements of the United States—helping to prepare the way where latent possibilities of mines, forests and farms were to be developed.

The continued growth of our national prosperity depends in a great measure upon the maintenance and continued growth of the utilities which furnish the means of intercourse and interchange. They are the indispensable servants of the individual, the community and the entire nation.

Worn Out Soils Made Productive

by using

Hauser's Organic Fertilizers

Science and practice both indicate that Nitrogen and Phosphoric Acid are necessary to produce the best results from the Citrus Orchards, and these two essentials are most prominent in organic fertilizer. Hauser's Organic Fertilizer is a concentrated soil builder and fruit producer. Put back into the soil at least a portion of the natural elements the orchard has taken out.

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertiser in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

THIS WEEK'S COVER

We believe that practically every intelligent orchardist is an intelligent pruner. We say practically everyone, for we realize there is an occasional fruit grower who believes there is no more need of cutting a branch from a tree than of cutting a limb from a human being. But if such growers live and care for fruit long and keep their eyes open, they usually determine that there is a difference. On the cover of this week's paper is a photograph of an almost perfect walnut tree. English walnut, we almost said, but California walnut is better. This latter term would doubtless be used more were it not for the fact that the California black seedling is used as a stock for the softshell, or ordinarily called English, walnut, or perhaps Madeira nut, but in any case English it is not and California it is, so let us adopt the name.

As to the shaping of this particular tree or as to the shaping of a walnut tree so as to bear best crops read Mr. Neff's article on third page of this issue. It will take but a moment; it is short, but it says things.

MORE CONSERVATION

Of all the sections of California abundantly supplied with water Fresno claims an advantage. Her waters are abundant and are delivered by the aid of gravity so that the cost is practically nothing, but with all the abundance and cheapness there is more to be desired. Some lands are without water and practically all the districts are less effectively managed than they might be if the various systems could be coordinated. Hence the seers of larger possibilities for Central California are suggesting a $15,000,000 combination which will not only conserve and use more effectively the resources now at hand, but will build great impounding reservoirs to hold back the floods which destroy, making them instead a blessing to the land.

George C. Roeding has been made chairman of the committee which is making preliminary investigations. It is one of the big movements which will take years to bring to completion, but trust Central California to bring it about.

WAR

Just as we are going to press we have a letter from a subscriber in San Diego County. The subscriber is a widow, a mother. She writes:

"If the United States should become involved in war and find it necessary to draft men, would a young man of 23, his mother being a widow past 50 with two daughters in school, be drafted?"

Most assuredly the young man is eligible and might be called to his country's colors. In time of war the welfare of the mothers of the land and the welfare of the children of the land cut but little figure. War is brutalizing, as has been shown by events in Europe. Three years ago had we charged Christian nations with acts which have been done since the beginning of this awful war it would have caused a riot had friends of those particular countries heard the charge. Now the United States is apparently being drawn into the same whirlpool.

America is today earnestly praying for peace and perparing for war.

May the prayer be answered. Meantime the sons are ready for the supreme sacrifice if need be, and if it is made it will not be as great as the mothers of the land will make.

HOLD 'EM TO IT

The California Lima Bean Growers' Association, like other cooperative organizations, has its troubles. It is having them now because some members have considered their contracts mere "scraps of paper". Their word, given apparently in good faith, was violated at their convenience. When their beans were needed to fill orders received they were sold to outsiders to be used in competition and weaken and unsettle the market. Now the association has placed its violated contracts in the hands of attorneys, and action will be taken to secure damages. Another year a different contract will be signed, carrying with it a clause by which the grower will agree to pay a certain penalty for every sack of beans he markets outside the association.

We sincerely hope that the association will win this fight to secure justice from those who violated their word last year. The association sold short because of these violations and loss was thrown upon the members who stood true.

ORANGE DAY

March 10 is California Orange Day. A California Orange Day committee has been appointed with headquarters at Los Angeles, and appeal is made to all the world to eat one or more oranges and in various other ways honor one of the most healthful of foods.

One ambition of the committee in charge is to make the orange crop of California bring into the state this year the $50,000,000 which will be sent out of the state to buy automobiles. However, we think the greater reward to the world will come from giving attention to this luscious fruit. Thirty railroads are helping in the campaign. Dining cars in all parts of the United States will observe the day. Remember the day, March 10.

CITRUS CONVENTION

State Commissioner of Horticulture Hecke informs us that arrangements are in the making for a great citrus convention to be held in Riverside June 4-9. There are so many sections in California producing citrus fruits that Commissioner Hecke has deemed it wise to call all horticultural commissioners of the state together. Even where they are from counties not interested in citrus he wishes them to come and see cultural methods as practiced in the citrus sections. So, preceding the convention, commissioners will gather and discuss not only mealy bug and other citrus topics, but all cultural methods.

The new commissioner proposes to keep in touch with every nook of California which has to do with fruit culture, and frankly says that successful methods which have been practiced in his own orchards in Yolo County are, many of them, due to inspiration received from methods practiced by citrus orchardists.

MEALY BUGS

On Tuesday there was held in Riverside a conference of horticultural commissioners of the citrus districts of Southern California to discuss the eradication, or rather the control, of the citrus mealy bug. This pest seems to be held in check by natural enemies until at times there is a combination of circumstances which enables it to develop beyond normal, and trees are seriously injured. Part of its life is spent in the ground, and its control offers many difficulties. Sections which are comparatively immune have proposed to take drastic measures to eradicate the first showing of the pest. We go to press too early to give recommendations of the commissioners, but this conference was under direction of State Horticultural Commissioner Hecke who went with Secretary Maddox to Southern California to aid in control work and to receive suggestions of the county commissioners. Mr. Hecke gives assurance that every effort possible will be made by the state board of horticulture. Prof. H. J. Quayle of the University of California and R. S. Woglum of the federal department of agriculture are making investigations. The state insectary, under direction of the state horticultural commission, will also join in this campaign. Within a few weeks a definite campaign will be outlined.

COW TESTING

THE Cultivator is receiving assurances from dairymen who are members of cow testing associations that they are entering the contest for the Cultivator's $300 offered in the University of California Dairy Cow Competition. The dairyman who has been wise in choosing and who will be wise in feeding and in caring for his dairy will have a reward to justify his wisdom and care. In addition the Cultivator would encourage greater effort along this line and offers one prize of $100 to the dairyman with herd of from ten to 25 cows, $100 to the dairyman with herd of from 26 to 50 cows, and another $100 to the dairyman owning herd of over 50 cows, who shall make the greatest butterfat showing in the state dairy cow competition now under way. March 1 is the last day on which entries may be made. Every dairyman, member of a cow testing association, should write at once to Prof. F. W. Woll for entry blanks.

Agricultural Notes

The Chinese government has been experimenting for some time with sugar beet culture.

The coming year's appropriation of federal funds for rural post roads gives to California $302,127.

Over a million and a half people use the national forests as playgrounds is the report of the forest service.

Citrus growers of Sicily are backing a citric acid factory at Messina which will utilize much of the cull fruit.

The 1916 salmon pack of British Columbia amounted to 1,000,000 cases. The run of sockeye was unusually small.

Experiments are being made in England in manufacture of milk from peanuts, soya beans, sugar, water and the mineral salts found in milk.

Over $6000 in fines has been collected the past year from violators of the pure food and drugs act by the California state board of health.

The highest prices ever were realized for South African wool this season, the record price being 54 cents per pound for super hoggets.

The Japanese produce a "vegetable milk" from the soy bean. This milk is used fresh, in a condensed form, and as the basis for vegetable cheese.

The total value of crops and animal products in the United States in 1916 was $13,449,000,000 according to estimates of the department of agriculture.

A gain of 3½ per cent in the commercial sugar crop of the Hawaiians is said to be assured by the invention of a new process for recovering sucrose from final molasses.

Oil mills on the Pacific Coast have been operating for several years with soy beans imported from Manchuria and have found a ready sale for the oil, cake, and other products.

The Swiss state railways, owing to the insufficiency of coal which previously has been imported from Germany, recently announced that they would be forced to reduce railroad traffic by one-third, beginning February 15.

A cooperative fruit growers' association of South Africa maintains selling quarters in Johannesburg for direct disposal of fruit to wholesalers, no quantity less than box or basket being sold. An auction is maintained from seven to nine o'clock for disposal of the larger lots.

Uruguay suffered terrible losses last season through drouth and locust plague. The department of industries recently called a national congress of live stock men and farmers to consider relief measures and investigate means of preventing a recurrence of such losses.

The English food controller has fixed the following prices to growers for the 1917 crops: Wheat, 60 shillings per 504 pounds; oats 38s. 6d. per 336 pounds; potatoes, in not less than six-ton lots f. o. b., 115 shillings per ton, from September 15 to January 31; 120 shillings for delivery in February and March, and 130 shillings other times.

At a recent conference of the Australasian fruit growers in Melbourne a motion asking for increased duty on fruit entering Australia was defeated. (American apples, oranges, lemons, etc., are now being imported into Australia in large quantities.) Another motion was passed urging that California admit Australian fruits generally from districts free from fruit fly or other diseases."

Agricultural News Notes of the Pacific Coast

Northern California

The Napa schools have inaugurated a pork producing contest.

Rice growers of Yuba County estimate their output at about 50,000 sacks.

Some 7000 acres will be planted to almonds in the Arbuckle section of Colusa County.

Farm advisers of the state will gather at Berkeley on the 11th for their annual contest.

Forest rangers of California met at Berkeley January 3-12 to discuss problems of forestry.

Prunes lead in heavy planting this season in Butte County. Olives and oranges come next.

The university farm at Davis has opened for the spring term with an enrollment of over 300.

The output of potatoes from the Fruit Ridge district of Eldorado County is expected to be 75 carloads.

Colusa County's grain fields in the Arbuckle section are being changed into vineyards and almond orchards.

Boys of the grammar school of Gridley, Butte County, have entered into a pig growing contest, which will close May 25.

Woodland, Yolo County, has a municipal work yard where all men out of employment can break rock at $1.10 a cubic yard.

The farm center at Orangevale, Sacramento County, has elected Samuel Thompson, president. The next meeting will be held February 19.

Butte County rice mills are attempting to establish a price of $1.75 per hundred on rice. The farmers are holding out for $1.85 and $1.90.

Cattlemen of the north are relieved at the change to warmer weather which means they will save the cattle which are dependent on range feed.

According to report of County Horticultural Commissioner Boedefeld of Colusa 1000 acres will be added to present prune plantings the next season.

Central California

Fig buyers are reported in the fields trying to buy up the 1917 crop.

The Raisin Association reports that the crop this year brought in over $8,000,000.

Announcement of the erection of the sugar refinery at Manteca has started something of a boom.

The Central Stockmen's Association reports a large increase of membership in Fresno County.

A large force of men are employed on the construction of the Spreckels sugar factory at Manteca.

The series of meetings held in Merced County for organization of farm bureaus has come to a close.

A bill providing for a standard of maturity for oranges has been introduced in the legislature by Senator Ashley.

An electrical display and floral parade are planned as part of the celebration of raisin day at Fresno on April 30.

Pay checks amounting to over $1,000,000 have just been mailed from the office of the California Associated Raisin Company.

The Santa Clara County Farmers' Union has elected E. A. Colby of Moreland, president, and W. S. Breton county marketing agent.

The Dinuba Grange will hold its regular meetings on the second Saturday evening of each month, instead of afternoons as heretofore.

The California Peach Growers' Association is receiving many letters commending the peeled peach which is now being offered to the trade.

Directors of the Madera County Fair Live Stock Association are negotiating for 100 acres of land near Chowchilla, to be used for fair purposes.

J. W. McCauley of Visalia and Arthur Swall of Tulare have been elected trustees from the seventh district of the Prune and Apricot Growers' Association.

Southern California

Lettuce is bringing a dollar a crate f.o.b. Brawley.

Beaumont has had a season precipitation of 9.93 inches.

The National Orange Show will be held at San Bernardino February 20-28.

There is talk of removing the pathological laboratory from Whittier to Riverside.

A new geological map of the state of California has just been published by the state mining bureau.

The Wells Fargo Express Company is encouraging the raising of truck crops in the Palo Verde Valley.

The Arlington chamber of commerce is making investigation with a view of establishing a cannery at that point.

The Timken Ranch Company near Brawley is arranging to plant 1400 acres to cotton and 1400 acres to alfalfa.

It is anticipated that large plantings will be made of apricots this year as a result of good prices received for last year's output.

A bill has been introduced into the legislature providing funds for the establishment of a university farm in Southern California.

Imperial will hold its second annual horticultural assembly February 10. Dr. Elwood Mead will talk on land colonization and rural credits.

The Hemet-San Jacinto Growers' Association held a largely attended meeting last week at Hemet at which report was made of the year's work.

Manager Harlow of the Queen Colony Fruit Exchange writes regarding an item appearing in this column last week in effect that "practically all orange packing houses of Riverside County have installed water separators", and he adds: "The Corona district happens to be in Riverside County, but out of the 12 houses located in this district we know of none that will install water separators this year, as there is absolutely no need for it in the Corona section."

The Coast

Jersey breeders of the Boise Valley of Idaho have organized an association.

Union County, Oregon, reports the building of several silos during the last year.

Grant County, Oregon, paid out over $12,000 in bounties on wolves and coyotes during 1916.

Farmers of Bannock County, Idaho, are working to secure the appointment of a farm adviser.

It is reported that there is some demand from hat manufacturers for jack rabbit fur for making felt.

Latah County, Idaho, reports an unusually severe winter with three feet of snow on the ground at present.

Over 1600 attended the farmer's week at the Oregon agricultural college at Corvallis the first of January.

The state of Washington will receive $90,000 from the federal allotment for building of roads within national forests.

The potato crop of Kelso, Washington, last year brought in $35,000. This year's shipments so far total 50 carloads.

Prune crops of Yamhill and Washington Counties of Oregon have been very satisfactory, the biggest ever harvested in that section.

Dairymen of Snohomish County have formed an association and bought land in Eastern Washington on which they will raise their own hay.

Hop growers of the North Yakima district in Washington have decided to stop hop growing and devote their fields to raising sugar beets.

At the recent convention of the Oregon Butter and Cheese Makers' Association at Salem the raising of standards of quality was the main subject discussed.

Records of the Puyallup Valley Association of Washington for last month show the average production per cow to be 26.1 pounds fat. The record holder produced 83 pounds.

ARNOTT & CO., Inc. 112-18 S. Los Angeles St. Los Angeles

Dr. David Roberts' COW CLEANER

You can't watch your cow too closely during the freshening period. Thousands of healthy, profitable cows are disabled every year because their owners do not take measures to make them clean properly. If you have a cow or heifer about to calve, *now* is the time to make sure it will clean properly by giving it Dr. David Roberts' Cow Cleaner. Dr. Roberts' Cow Cleaner ripens the cotyledons, or buttons, which hold the afterbirth and it comes away by its own weight. It does away with the forcible removal of the afterbirth, which frequently brings on blood poison, sometimes causing death. Come to the aid of your cows and heifers—give them Dr. Roberts' Cow Cleaner. It means health for the animals and profit for you.

Dr. David Roberts' Calf Cholera Remedy

should be given to your calves as soon as the dreaded scours appear. (*Scours lead direct to calf cholera, that highly contagious, death-dealing disease.*) Calf Cholera Remedy prevents fermentation of the food in the digestive organs and liquefies the poisonous gases which cause scours. It soothes the irritated mucous membranes and regulates the flow of the digestive juices. The calf's digestion becomes normal and the trouble disappears. Be prepared to save your calves.

Breeding Tonic makes sure breeding. Prepares organs for breeding. Use regularly and you will have fewer accidents and better, healthier calves.

Cow Tonic, Calf Meal, Diolice, Badger Balm, Laxotonic and Stokvigor—valuable remedies, which should always be kept on hand.

Get Dr. Roberts' Live Stock Prescriptions at your drug store—nearly 4000 dealers in U. S. Look for and insist on getting the package bearing Dr. Roberts' picture. If you do not already have the 184-page "Practical Home Veterinarian," treating all diseases of all live stock, send $1.00 and receive by mail, postpaid. Address

Feeding the Dairy Cow for High Production

Written for California Cultivator by J. M. Bomberger

I KNOW of no other feed that will stimulate milk production like fresh green alfalfa leaves. If there be such a thing as milk stimulant in feeds, I believe it is more abundant in the leaves of the fresh green alfalfa than in any other feed.

We dairymen in California are very fortunate in having an abundant supply of alfalfa to use as the base of our dairy rations, and we have besides a number of very excellent supplementary feeds.

Of course, it is not practical to feed all alfalfa leaves; but we should be very careful to save all the leaves when making hay so as to have the hay as leafy as possible, and when working for especially high records with very high producing cows it will pay to cut the alfalfa extra young so as to have the hay very soft and leafy.

Soiling

Alfalfa cut fresh and green as a soiling crop and fed as fresh as possible is even more efficient than the best of alfalfa hay for milk production, and when it is fed regularly there is little or no danger from bloat. I have fed alfalfa as a soiling crop for six years and have never had one case of bloat. I think one reason that cows are less apt to bloat when fed alfalfa as a soiling crop than when pasturing is because when soiling the cows are forced to eat the stems as well as the leaves, which necessitates more chewing than when only the tops and leaves are stripped off as in pasturing.

For soiling the alfalfa should be cut fresh every day, preferably when there is no dew, and it should be raked up and fed as fresh as possible and not be allowed to lie in a large pile and heat or sour. For a herd of 50 or more cows soiling is really less expensive for labor than making hay and feeding it. While green alfalfa is heavier to handle, the hay must be handled so many more times before it reaches the cows that are in my herd. After keeping careful expense accounts the soiling system has been found less expensive for labor, and very much more efficient for milk production.

Pasturing Alfalfa

A bountiful alfalfa pasture is more efficient for milk production than soiling or feeding hay; but from the standpoint of the welfare of the alfalfa land pasturing is, as a rule, not practical, and where pasturing is not practical soiling is the next best way of feeding alfalfa during the growing season and soft leafy hay during the winter.

Corn Silage

Those who are fortunate enough to have good corn silage to feed with alfalfa hay during the winter have one of the best possible supplements. The succulence and appetizing effect of the silage are a great help to maintenance of milk flow.

Concentrates

When choosing concentrates to be fed with alfalfa to high producing cows, use such mixtures as have been found by actual trial to fit in well with alfalfa rather than to depend upon theoretically balancing a ration and using an untried mixture. High producing cows, on test, are not suitable subjects for experiments.

When a certain mixture has been found very good with a certain cow or cows, do not change. If for any unavoidable reason you must make a change, make the change so gradually that the cow will notice the change as little as possible.

A few mixtures that I have found good are as follows:

Mixture No. 1. Equal parts of rolled barley and wheat bran.

Mixture No. 2. Equal parts of rolled barley, wheat bran, dried beet pulp and cocoanut meal.

Mixture No. 3. Equal parts of rolled barley, dried beet pulp and cocoanut meal, the mixture soaked in molasses water or where cane molasses is not available as such, molasses alfalfa meal may be used in the mixture.

Other tried mixures suitable for feeding with alfalfa may be had by writing to the state farm at Davis.

While it is important that proper feeds be fed, it is fully as important that the feeds be fresh, sweet and clean, so that the cows will relish the feeds to the fullest possible extent; because relish helps digestion quite directly and induces the cow to consume more feed and produce more milk.

All feed that has been left by the cow and nosed over and breathed over should be carefully removed before the fresh feed is put before the cows.

Be kind to the cows. Make friends of them. Hob-nob with them and you will be alert in noticing their needs and you will feel well repaid at the end of the ten months' test.

California and Arizona Cattle Interests Mutual

By A. L. Spellmeyer

California has been dominated by vast cattle interests which have dwarfed into insignificance the owner of a few hundred cattle. California has no brand inspection and lacks the protective laws afforded stock owners in Texas or in Arizona. The stockmen have had no associations, heretofore, worthy of the name, no cooperation, and have had until recently no stock papers which attempted to give range conditions and cattle news and correct prices of beef and feeders and yearling steers. The daily newspapers carry price quotations on both beef on the hoof and beef dressed, which are a great part of the time different from those actually exisiting. California is not stocked to capacity, and thousands of owners of good grass ranches would secure cattle if they knew where to get them and where to get the loans to carry them after they got them.

Arizona is a great export state for yearling steers as well as a limited number of twos and threes, steers and stock cattle. Arizona today has many full blood Hereford cattle eligible to registration, or registered, but California is the logical supply point, if Cali

fornia growers with their climate and fenced ranges ever wake up to the fact that a market is right at their doors for all full blood Hereford bulls and heifers they can possibly raise.

California today purchases over 100,000 Arizona-born cattle yearly; Arizona is interested in seeing the California man do well, as it means a market for the yearlings and stock cattle, feeders and beef, and a source of supply for bulls and full blood heifers which Arizona wants to improve its herds. Arizona is in the period of transition from open range to fenced range. Many ranges are being fenced, land bought and the greater expense is forcing a higher type of cattle.

One cannot blame the large oufits nor the packers, as California packers have, considering the opportunity afforded by the split up stock raisers, paid very good prices and have been most reasonable. The large outfits would welcome more stable prices, better quality and better marketing methods. At the present time hundreds of California ranches are being leased at from two dollars to five dollars per head per year for grass range, subject of course to sale, and these California ranches are not doing much more than paying taxes and expense, not figuring a reasonable interest rate of return. Lack of knowledge or inclination causes such California owners of grass ranches to lease instead of own their own cattle, although it is sometimes the lack of money to buy the cattle. There are many Arizona ranches which can supply stock cattle and would consider some arrangement much more satisfactory than the present lease system, or would lease at considerably more than present prices, if they knew the ranches and the parties owning them.

Wool Clip Commandeered

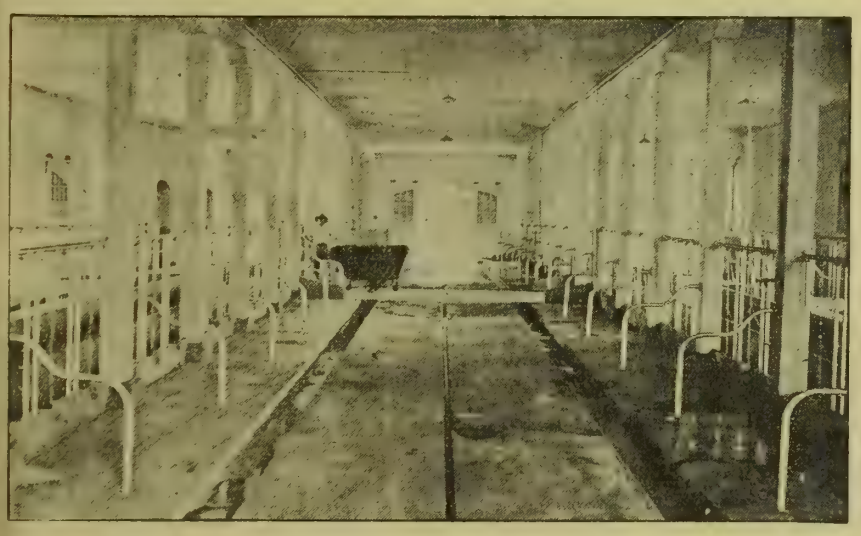
Word has just been received by Live Stock Specialist G. W Barnes of the Arizona state university, that the British government in addition to commandeering the entire wool clip of New Zealand as was decided two weeks ago, has now commandeered the entire cross-bred clip of Australia. Australia being chiefly a merino coun try the amount of cross-bred wool produced there is considerably less than in New Zealand, yet it is a very substantial quantity and will have a tremendous influence on the market.

During the next few months fine cross-breds will run up to astonishing prices. The sheepmen who continue to sack their wool will not get much benefit from the still greater advance to follow in a few weeks, but those who class and bale their wool will get the full benefit.

It seems the chief reason for commandeering this extra large quantity of cross-bred wool is on account of the great shortage in Russia. Most of the wool produced in Russia is inferior merino and carpet wool with a comparatively small quantity of wools suitable for army clothing.

This naturally leads one to believe that the decrease in the sheep population of many European countries is much greater than any one imagines, and, when the exact figures are known eventually, they will completely dwarf the great decrease in Australian and South American last year.

Unfortunately some of the sheep men in Arizona seem to stand aloof from the more progressive movement of properly preparing their wool for market. The sheep men of the Northwest seem to be more alert. The sheep men in Wyoming, Montana, Idaho, etc., who have the modern demonstration shearing sheds are realizing the importance of rapidly baling their wool and getting it on the market immediately after shearing, are now commencing to "scrap" their hand balers and introduce power presses. These power presses have been ordered shipped over and are to be installed immediately upon their arrival. Two of the modern shearing sheds in the Northwest are drawing plans for the alteration of the engine room so that power baling could supercede hand baling. Three of the sheds built last year handled 80,000 sheep. This season, nowever, they intend to handle 150,000 sheep and they have given instructions to engage the employes for two weeks longer than last season. Sheep men, where the modern shearing sheds are erected, seem to be awake and keen to go ahead, and the big problem is the securing of skilled help and the training of help to satisfy this progressiveness.



A Modern Milking Barn

The Trend of Beef Cattle Values

By Frank D. Tomson

The records show that public sales of beef cattle in the fall usually result in somewhat lower prices than in the spring and late winter season. Yet it would appear from the public sales held so far this season that Shorthorn values will hold to a higher level than during the spring sale season. The fact that the present season is an exception so far as the breed is con-

California State Fair 1916

The Type We Are Breeding For

Hardy, prolific sows of best blood lines and breeding. Strong, upstanding, prepotent boars. In short the best possible specimens of the Berkshire breed. We plan to do this by breeding large numbers and from them making a rigid selection.

James Mills Orchard Corporation
Hamilton City, California

There are many reasons why you should always buy advertised goods. They are guaranteed.

cerned indicates an increasing demand.

The sale of imported Shorthorns, held at Chicago November 1st by Carpenter & Ross of Ohio, resulted in an average of $911 on 72 head, all of the calves with two exceptions being sold separate from their dams. Had they been sold together, as is the prevailing custom, the average would have been considerably higher. The cattle were widely distributed, going into 11 Central states.

It was in the Anoka Farms sale in Wisconsin that the most positive evidence of demand for Shorthorn seed stock was manifested. The year's half crop, 40 odd head in number, sold for an average of $1016. At the opening of the sale ten of the most desirable were displayed in the ring, and when sold the average on these ten stood at $1900 per head. The Anoka Farms' exhibit in the get-of-sire class in the leading shows was included in this sale, and the quartet sold for an average of approximately $2400 each.

At the joint McDermott, Weaver & Garden sale at Chicago an average of $677 was made.

It is a significant fact that in these sales, no efforts were made to create unusual enthusiasm. The bidding represented the sober judgment of the farmers and breeders, and the settlements were practically all made in cash. The purchases were made for foundation breeding material and the discrimination in these selections clearly indicates the broad purpose of breeders in all sections to improve the standards of their herds in keeping with the general tendency toward higher achievement in American live stock husbandry.

Many farmers of Custer County, Montana, have built pit silos.

Advantages of Silos

IT will soon be time for planting silage crops. Why silage in California? A good answer is given in "The Silo in California Agriculture" by Prof. F. W. Woll of the University of California, published something over a year ago and from which we quote:

Advantages of Silos

"The system of making and feeding silage, often called the siloing system, must have some very important advantages over hay making or field curing of forage crops, for it can be truthfully said that it has largely revolutionized the methods of feeding farm animals in this country during the last quarter of a century. Some of these advantages are readily seen; others are more difficult to discern and can only be studied and their importance determined through careful experiments. The dairy farmer or stockman who adopts the siloing process may not be aware of the special advantages of this system but is doubtless often guided in his decision by the enthusiasm or favorable opinion of neighbors or agricultural writers or speakers with regard to the merits of the silo. It may be well, however, to consider briefly some of the main points of the superiority of the siloing system under the special conditions of farming in this and other Western states.

Silage furnishes a succulent, readily available feed of uniform quality which is greatly relished by all classes of farm animals and especially adapted for feeding dairy cows, beef cattle and sheep.

Generally speaking, the silo enables the farmer to secure the largest possible amounts of feed materials from a certain area of land for feeding farm animals, in the most convenient and cheapest manner.

The silo will preserve green feeds, like Indian corn, sorghum, grain forage, alfalfa, clover, pea vines, etc., in a succulent condition for feeding at any time during the year; it furnishes valuable supplementary feeds for late summer and early fall feeding, when pastures are likely to be short, as well as for winter feeding when green feed is either scarce or lacking.

The silo makes farmers less dependent on weather conditions than when hay is made, and enables them to get along with smaller barns or sheds than otherwise, since less room is required for storing feed in this form than in the form of hay, or other dry forage.

The value of succulent feeds in feeding milk-producing animals is well understood; silage also forms a valuable palatable feed for growing or fattening cattle or sheep, keeping them in a thrifty condition throughout the winter and doing away with the check in production that always occurs with changes from succulent to dry feed.

The acidity of the silage, which comes largely from the lactic acid formed in the fermentation of the feed, has an important dietetic value, regulating the bowels and checking undesirable putrefactive processes in the intestines. The favorable influence of silage on the health of animals that has been commonly observed is, in all probability, due partly to the silage acids and partly to the succulence of the silage.

A Jersey cow owned by W. C. Whitsett of Orland heads the list of butterfat producers in Glenn County with 75.3 pounds of fat for the month.

STATE JERSEY BREEDERS

The California Jersey Breeders' Association recently convened in Stockton and the members exchanged congratulations on the fact that new life is being instilled into the Jersey industry. The Jersey futurity stake was arranged and time of closing of entries extended to March 1, 1917. This will be a regular event at the California state fair each year.

LIVE STOCK SALES

Kings County Third Semi-Annual Poland-China Breeders' Assn. Sale., Hanford, March 7, 1917.

Stephenson Holstein Herd, Lake Mills, Wisconsin, May 1, 2, 1917.

D. O. Lively Stock Farm Sale, Hereford Cattle, Mayfield, May 3.

Pure Bred Duroc-Jersey Hogs, Brawley, California, Monday, February 25, J. P. Williams, Mgr.

The date was set for the regular annual meeting during the state fair on Wednesday evening of fair week. It was urged that a dairyman be appointed on the board of directors of the state agricultural society. Field Agent Robertson recommended the organization of local breeders' associations.

The next meeting is to be held at the time of the university farm picnic at Davis, April 20.

The Silver Birch Farms of Washington are issuing a private sale list of bred Berkshire sows and gilts. Over 30 fine youngsters are listed, with items showing breeding and winnings of the youngsters. The Silver Birch Farms also announce that orders are now being received for spring pigs.

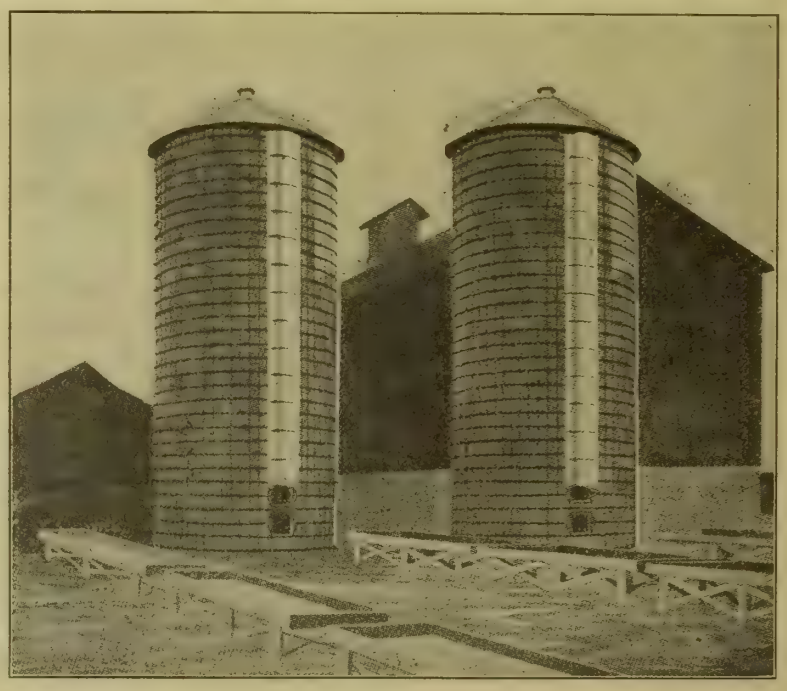
THE PLAYFORD CEMENT STAVE SILO

Is Now Being Presented to California and the Pacific Coast

The successful operation of the silo in the East gives assurances that it will meet with even greater success in the West where conditions are more favorable to keeping silage.

Mr. William Galloway, well known manufacturer of Iowa, says: "I have seen a great many silos made from every kind of material, but I think you people have a silo that beats them all."

We have a big book full of statements from satisfied users.



POINTS OF SUPERIORITY

Air and water proof.

No air spaces to serve as juice boxes.

ACID PROOF

It is permanent and grows stronger with age.

It cannot split or warp.

Guaranteed to keep perfect silage.

Made of the best material.

BEAR IN MIND

that this silo is not susceptible to atmospheric conditions. It will not rot or burn—it will not split, crack or warp. Once up it is up to stay and to give perfect satisfaction under all conditions.

It requires no side braces to hold it from blowing over. It never changes position, and the strongest wind will not disturb it. You cannot have anything on the farm that has the permanency, durability and satisfaction that the **Playford Cement Silo** has.

Write for our circular, together with pictures of the Silo in operation on some of the best known farms and estates in the East. We will also send you statements of our many satisfied users. YOU CAN JUDGE FOR YOURSELF as to the permanent value of the PLAYFORD CEMENT STAVE SILO.

501 NEW CALL BUILDING **Cement Stave Silo Company** SAN FRANCISCO, CAL.

Unsigned communications receive no attention.

Parturient Apoplexy or Paralysis

I had a cow that came fresh a short time ago and next day could not get up. The calf came in a short time and the afterbirth passed in good time. I called a veterinary at once and he treated her for what he called milk fever by pumping air into the udder and giving her a hpyodermic to bring her vitality back. After four days' treatment her left hind leg began swelling and continued until the skin cracked. The doctor said the leg was broken and advised destroying her. Not wishing to do so I made her as comfortable as possible and fed her on scalded bran and green barley hay. She lived about four weeks, when she bloated badly and died that night. I milked the cow and gave the milk to the calf which is five weeks old now. The calf eats well but is not right now. All around the rectum and under the tail the hair is coming off and there are some small scabs on the skin. Please tell me what is wrong with the calf and what was wrong with the cow.—Subscriber.

There are two distinct diseases that sometimes follow calving. The true milk fever (parturient apoplexy) seems to originate from a ptomaine in the udder which stops the secretion of milk; and being absorbed stops the action of most of the secreting glands, also causing paralysis and coma. The other form (parturient paralysis) simply manifests itself by paralysis of the limbs while most of the organs continue acting normally while there is no coma or inclination to sleep. The latter trouble is usually said to be due to pressure on the nerves by too large a calf and usually follows difficult parturition but does sometimes occur when the calving is easy and ordinary. The doctor's treatment for milk fever was all right and up-to-date, but in cases where the milk is not suppressed and the brain clear the inflating of the udder is unnecessary. When paralysis continues too long after either disease it is hard to cure.

As to the calf the trouble indicates the presence of a germ of some kind in the bowels. Put two or three drops of zenoleum in the feed morning and evening and bathe the parts where the hair is coming off with a warm solution of zenoleum, using a teaspoon to the pint of water.

AYRSHIRE BREEDERS' ANNUAL

The 42nd annual meeting of the Ayrshire Breeders' Association was held at Hotel McAlpin, New York, January 11. The report of the secretary showed an increase in the number of members over any year since the organization of the association, 108 members having been added, coming from all parts of the United States and Canada, but particularly from the West and Southwest.

Officers for the ensuing year are: Percival Roberts, Jr., Narberth, Pennsylvania, president; vice presidents, Hugh J. Chisholm, Port Chester, New York; J. W. Clise, Redmond, Washington; Adam Seitz, Waukesha, Wisconsin, and Wilson H. Lee, Orange, Connecticut; secretary-treasurer, C. M. Winslow, Brandon, Vermont.

Duroc-Jerseys are to have a publicity agent. The National Duroc-Jersey Record Association has appointed a field secretary to visit stock breeders meetings, attend fairs, extend newspaper publicity and generally increase acquaintance with the breed. R. L. Hill of Columbia, Missouri, is the new appointee.

Alpha Automatic High Pressure Power Sprayers

Drive the Solution into the Trees Under a Uniform Heavy Pressure

The satisfactory results obtained with either the Alpha Triplex or Alpha Duplex outfits are due primarily to the following unquestionable superior features of the Alpha Sprayers:

The Automatic Pressure Governor

which insures safety, secures uniform pressure, and eliminates unnecessary wear and strain on both pump and engine. No troublesome relief valves or diaphram pressure regulators are required on Alpha Sprayers. No liqui is pumped except it is forced through the nozzles.

The Perfect Power Plant

The Alpha Gasoline and Distillate Engine which is directly geared to the pump is a thoroughly first class machine. Built to stand up under continuous full load. Equipped with built-in, gear-driven magneto. No batteries required. Starts on the magneto without cranking.

You can equip the power sprayer you now have with an up-to-date reliable Alpha Engine. Write us for Special Engine catalog.

The Alpha Re-filler; the Flexible Suction Pipe connection between Supply Tank and Pump; the sturdy steel frame construction and accessibility of Alpha Sprayers are details which would be decidedly to your interest to investigate before buying any spraying equipment.

For full particulars and name of nearest dealer, fill in and mail the coupon.

Paint Without Oil

Remarkable Discovery That Cuts Down the Cost of Paint Seventy-Five Per Cent

A Free Trial Package is Mailed to Everyone Who Writes

A. L. Rice, a prominent manufacturer of Adams, N. Y., has discovered a process of making a new kind of paint without the use of oil. He calls it Powdrpaint. It comes in the form of a dry powder and all that is required is cold water to make a paint weather proof, fire proof, sanitary and durable for outside or inside painting. It is the cement principle applied to paint. It adheres to any surface, wood, stone or brick, spreads and looks like oil paint and costs about one-fourth as much.

Write to Mr. A. L. Rice, Manufacturer, 129 North Street, Adams, N. Y., and he will send you a free trial package, also color card and full information showing you how you can save a good many dollars. Write today.

Feed Your Calves at Half Cost

A properly constituted Calf Meal is equal to and better than cow's milk for raising calves, because it takes the place of milk, thus saving 50% of your feed bills.

LILLY'S Calf Meal

is thoroughly cooked under 60-lb. steam pressure. It is all food, easily digested, fresh and sweet with that nutty flavor so relished by calves.

Most Dealers sell it. If yours does not, write

Veterinary Notes

By Dr. F. A. Orme, San Francisco Veterinary College

All sick animals should be immediately removed from contact with healthy ones, at least until the nature of the disease is known. They should be fed and watered from separate vessels.

The outside wall of a horse hoof should never be touched with a rasp or file, as the covering (periople) provided by nature is removed, thus permitting the penetration and absorption of filth that causes the hoof to become contracted and brittle, producing a predisposition to quartercracks.

Overfeeding and irregular feeding is the cause of more sickness among horses than any other known cause. The stomach of the horse is so exceedingly small compared to his size that he should be fed and watered at least three times per day, the capacity of the horse's stomach being 18 pints. The capacity of a cow's stomach is 52 gallons.

The old familiar saying: "If a horse has a broken leg, remove the shoe and examine the foot anyhow," should certainly be acted on to the extent that every lame horse should have the shoe removed and the foot thoroughly examined.

Manure should not be allowed to accumulate inside the stable, as the inhalation of noxious odors in many instances causes an irritation of the air passages and renders them liable to coughs and colds.

A mixture of equal parts of tincture of iodine, turpentine and sulphuric ether, applied once daily for several days, will stop the growth of new splints.

The horse should be shod at least once every 40 days whether the shoes are worn or not, as the hoofs overgrow the shoes, this being the cause of inflammation of the feet and corns.

Some of the causes of colic are overloading the stomach, dirty alimentary matters, retention and hardening of excrementatious matters, calculi and concretions, intestinal worms, prolonged fast, unusual movements (rolling on the back when cast), retention of urine and bolting the whole grain from gluttony or hunger, etc.

Lime-Sulphur Animal Dips

A convenient formula for preparing lime-sulphur animal dips, termed the 8-18-10 formula, is suggested, as a result of extensive experiments, in professional paper No. 451, "The Chemical Composition of Lime-Sulphur Animal Dips," recently published by the United States department of agriculture. The experimental work was undertaken with the object of improving existing formulas so as to simplify the preparation and, if possible, lessen the cost of these dips. To accomplish these purposes the author recommends—but solely for use as an animal dip—the 8-18-10 formula; that is, eight pounds of high-grade commercial quicklime, 18 pounds fine sulphur (either flowers or flour), with somewhat more than 10 gallons of water, boiled to a volume of 10 gallons at the finish. The time of actual boiling should be one hour. The theoretical ratio between lime and sulphur will be met by this formula if the lime is 98.3 per cent pure; therefore the formula as given is appropriate for preparing a solution for dipping sheep where any chance of an excess of lime must be avoided. If commercial hydrated (not air-slaked) lime is used the amount should be increased nearly one-third, say to 10.5 pounds. For dipping cattle the formula may be used on the basis of available calcium oxid if the analysis of the lime is known, or if not known the lime may safely be raised to 8.5 pounds, corresponding to 92.5 per cent available calcium oxid, possibly even to 9 pounds.

The finished solution, drawn off from the sediment, should theoretically contain 18 per cent (grams per 100 c. c.) of sulphid sulphur, but probably will contain somewhat less. It is, therefore, appropriate for dipping sheep at a dilution of one volume of concentrate to nine or 10 volumes of water, and for cattle at a dilution of one volume of concentrate to seven or eight volumes of water. But in any event, since baths lose strength during dipping, it is very desirable to keep them at all times under control by means of a "field test."

It is pointed out that this formula does not necessarily apply to the making of highly concentrated proprietary solutions.

The bulletin, which is highly technical, contains in its 16 pages the results of a number of experiments on the effect of storing, and of varying the concentration and ingredients, which should be of interest to chemists and veterinarians.

REPORT OF STATE DAIRY BUREAU

The 11th biennial report of the state dairy bureau for 1915-16 contains proof of the growth of the dairy industry. It shows that the butter production has increased during the last ten years from 44,000,000 pounds in 1915, to 70,000,000 pounds in 1916. In cheese the increase has not been so pronounced, in fact, it has but little more than held its own. Condensed milk production has increased from 134,000 cases to 379,000 cases. The value of

$3,000 Net Profit
From Jerseys in a Single Year

A Jersey herd of 43 milch cows netted an Ohio dairyman that amount last year above the cost of feed and labor from the sale of milk alone. The sale of surplus stock also brought a tidy sum—additional profit. You can do as well or better.

Jersey milk, because of its high percentage of butterfat and milk solids, will often bring several cents a quart more than ordinary milk equally clean.

Our book, "The Story of the Jersey" points the way to dairy profits. A postal brings it. Write today.

The American Jersey Cattle Club

dairy products of California during all 1916 was $40,310,105.

A list of the creameries of California is one feature of the report and a list of various court proceedings instituted by the bureau during the two years is also given. One feature out of the ordinary for reports of this kind is a series of plans and drawings for milking sheds, milk houses, sewer systems, etc.

Efficient Use of Milking Machines

That milking by machinery, compared with hand milking, is less expensive in general in herds of more than 15 cows, and more so in smaller herds, is indicated in recent studies made by farm management specialists of the department of agriculture. Herds that normally required three men for milking by hand, only two of whom were needed to feed and care for the animals, required only two men to milk by machine.

It was found that in herds of 15 cows or less the average time required to milk a cow by hand was a fraction over seven minutes, and by machine a fraction under five minutes. In herds of over 50 cows, the time required to milk by hand was a fraction under seven minutes and by machine 4.15 minutes. In milking by hand the average cost per cow in herds of 15 cows or less was $10.91 a year as against $10.45 in herds of 50 or more. When machines were used the cost was $11.77 a year in the smaller herds and $7.34 in herds of 50 or more.

The value of the labor replaced by the milking machines was found to vary from $2.63 per cow in herds of 15 cows or less to $8.33 per cow in herds of more than 50 cows. The addition to the time available for field work due to use of the machines was found to vary from 1.5 to 5.1 hours according to the size of the herds.

Attention is called to the fact that milking machines must be operated by competent operators and that stripping by hand after the machine is essential if satisfactory results are to be obtained. The majority of the farmers visited during the studies believe that the milking machine has no effect one way or the other on the general welfare of the herd.

Studies of the comparative efficiency of various combinations of milking units and operators indicate that the greatest speed is made when one man operates and strips after two units, each of which milks two cows.

Cotton Seed Meal for Cattle

"The value of cotton seed meal as a food for dairy and beef cattle has long passed the experimental stage," writes G. W. Barnes, University of Arizona. He adds; "it may also be used to advantage as a supplemental grain ration for horses and mules.

"The highly concentrated character of cottonseed meal makes it necessary that it be incorporated with other feeding stuff of a more bulky nature. If cotton seed meal is the only meal or grain fed, and the roughage contains no green feed of any kind, about four pounds of cotton seed meal a day can be fed without injury. Cotton seed meal and corn silage make a good combination for dairy cattle, and when cotton seed meal is fed with corn silage the animals remain in a healthy condition and consume the ration with much relish.

"Quoting from farmers' bulletin 743: Cotton Seed Meal (Choice) Digestible nutriments—Protein 37 per cent, carbohydrates and fat 41.2 per cent. Cotton seed meal is the richest in protein of all the common cow feeds on the market. It is usually the cheapest source of protein available, but it does not have the best physiological effect upon the cow, often causing digestive troubles if fed in large quantities for long periods. At first it is advisable to start with one or two pounds a day, gradually increasing the quantity if no bad results are observed. In some herds in the north as high as five to six pounds a day are fed without bad results. In the south there seems to be no limit in this direction."

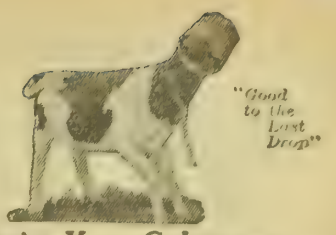
More and Better Hogs

Oleomargarine Situation in Congress

The oleomargarine interests are getting very busy starting a propaganda to permit them to sell colored oleomargarine. A bill has been introduced in congress and referred to the committee on agriculture, to tax oleomargarine one cent a pound, and the same to be put up in cartons. This bill strikes out the present 10 cent tax.

The great bulk of oleomargarine sold today is paying one-fourth of a cent a pound tax and is uncolored. The oleo people are stating in their literature that the tax on oleomargarine is 10 cents a pound and that they want to have it reduced to one cent. It is surprising to see how this propaganda is being used by city papers, whose editors should know the law—that the tax on uncolored oleomargarine is one-fourth of a cent a pound, instead of 10 cents a pound.

The National Dairy Union appeals to farmers and dairymen of this country to get in touch at once by letter or otherwise with their members of congress and state that under no condition will farmers submit to having oleomargarine colored and thereby permit unfair competition with butter.



Raise Your Calves on
Blatchford's Calf Meal
and Sell the Milk

More calves have been raised on Blatchford's Calf Meal than on all other milk substitutes combined.

100 lbs. makes 100 gallons of milk substitute, costing only one-third as much as milk. Prevents scouring and insures the early maturity of sleek, handsome calves.

It is steam-cooked and no trouble to prepare or use.

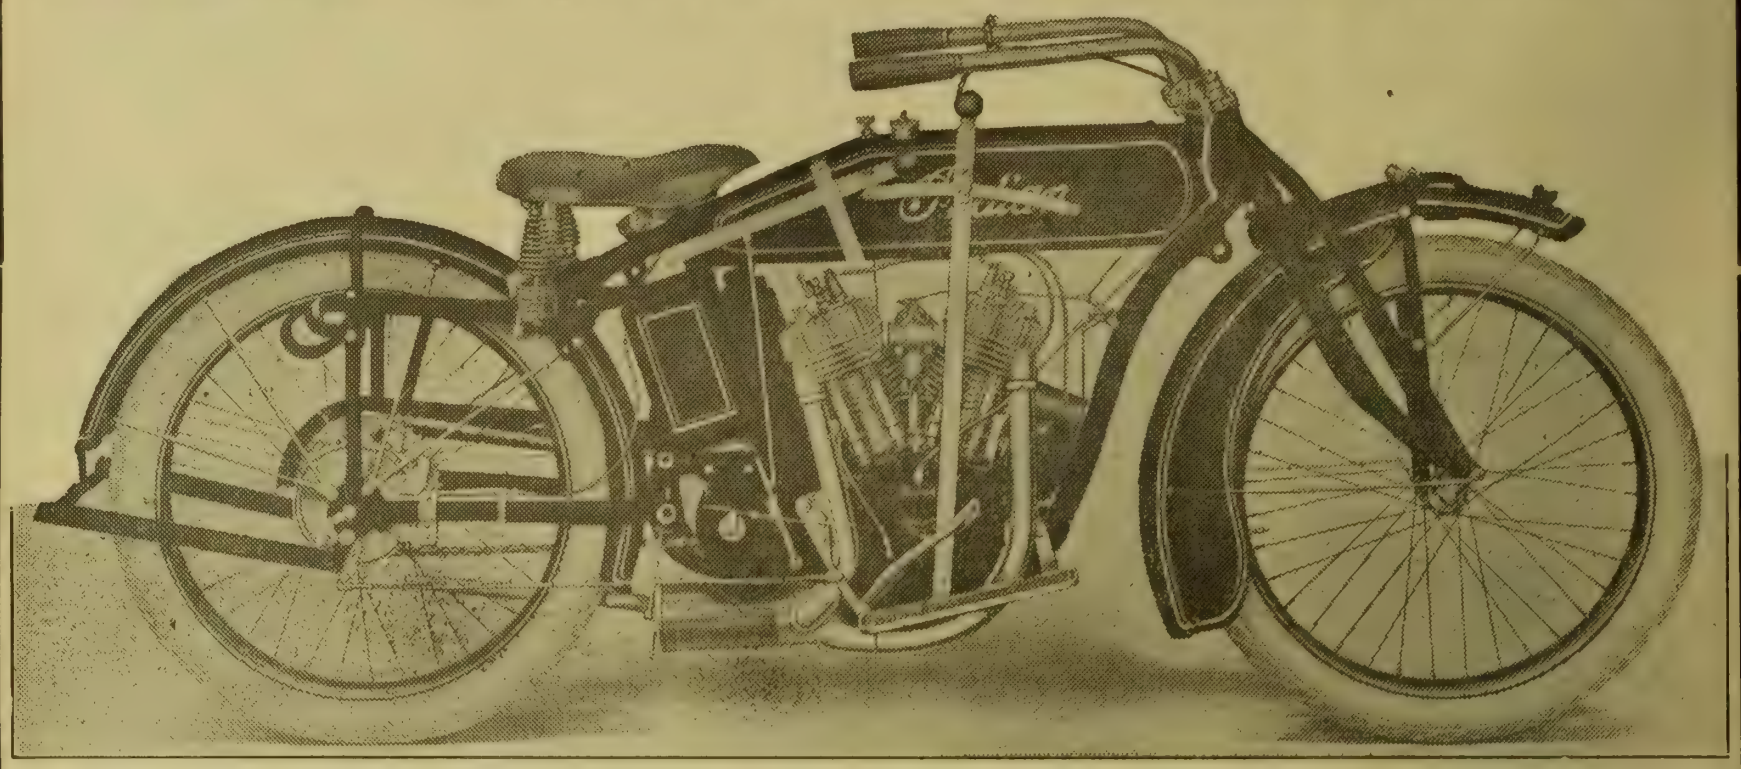
Motorcycle Given Away

Turn Your Spare Time into a Fine Prize. This is the Easiest Way to Get One



Many have already secured machines by this easy plan. We pay for the work you do and you can work just during spare time. Write us today about it. It costs you nothing to enter the Campaign.

Do You Want a Motorcycle?

Wouldn't you like to have one of the new 1917 $290 Indian motorcycles without its costing you a cent? You can have one. California Cultivator is going to give away over $500 in prizes in return for doing a little work that you can easily do just during your spare time, including this Indian motorcycle. The Campaign Manager has already given away ten motorcycles that were secured with far less dollars in subscriptions than the same machines would have cost in dollars of a dealer. This is the easiest way to get one. Send us your name and address at once on the blank below so we can write and tell you all about it. This places you under no obligation to us whatever. You do not even have to be a subscriber to California Cultivator.

Here is an opportunity that you can make worth a good many dollars to you, if you will only take advantage of it. Someone is going to get this motorcycle—why not you? It might just as well be you as anybody and no harm will be done in trying. We are ready to turn over to you in Cash and Prizes what we would pay others for doing this work for us and you can do this work easily during your spare time.

This motorcycle will give you more pleasure than anything of equal value that you could own. Many others have already been given away, that were easily and quickly won, and the winners were very glad they saw the announcement like this and sent in their names. We had never heard of anyone of them before and none of the winners had ever taken a subscription before or done anything of this kind. You have just as good an opportunity as anyone else to win this $290 motorcycle, the latest model new 1917 machine—the very best you could get. Will you try? It costs you nothing to enter this campaign. You do not even have to be a subscriber to California Cultivator.

Arthur Allston of Whittier won the motorcycle given away December 31 with far less dollars in subscriptions secured than the motorcycle would cost of a dealer. Here is what he says:

Whittier, Cal., Jan. 30, 1917.

Cultivator Publishing Co.

Gentlemen: I entered the campaign which has just been completed by the Cultivator Company and was successful in winning the $290 Indian Motorcycle. The campaign was fair and square in every way and I was very much pleased with the way it was carried on. I would advise anyone that has little spare time to enter the next one which is soon to start, as I won the first prize with 140 subscriptions. It is a valuable prize for a small amount of work.

Yours truly
ARTHUR W. ALLISON.

Don't wait—send in your name and address at once on the blank below. The sooner you start the easier and better it will be for you.

Fill out this Free Entry Coupon and Mail Today

Manager California Cultivator Motorcycle Campaign, 115 North Broadway, Los Angeles.

Dear Sir—Please send me free of cost full information about the $290 Indian Motorcycle and other prizes you are going to give away.

My Name .....

My Address .....

In Care of .....

Street or R. F. D. ..... State .....

YOU WON'T KNOW HOW EASY IT IS UNTIL YOU START

You never will know how easy it is to win one of our motorcycles or how much **money you can make** until you enter and get started, which requires that you send your name and address for full information about the prizes and campaign. You might just as well become the owner of this motorcycle as anybody. You can have just as much fun with it as with an automobile and the cost of operating it is much less, and it will be given away absolutely free, freight charges prepaid. Sign and send the **blank at once to** Manager Motorcycle Campaign, California Cultivator, 115 North Broadway, Los Angeles, Cal.

THIS IS THE BIGGEST PRIZE LIST WE HAVE OFFERED

This is the biggest prize list we have offered and everyone taking part not winning one of the big prizes will be paid in cash for the subscriptions they secure. The campaign will start soon. A certain number of points will be given for each subscription you secure and the boy or man having the highest number of points by 6 P. M. Saturday, April 7, will be awarded this $290 Indian Motorcycle. The Second highest will receive $75 in cash, third highest will receive a $30 talking machine outfit, fourth highest will receive a $30 gold watch, fifth and sixth highest will each receive $45 college scholarships, seventh highest will receive a $15 gold watch. In case of a tie for any prize, prizes of equal value will be awarded to those in the tie. The $290 Indian '17 Motorcycle is guaranteed to be new and in absolutely first class condition by California Cultivator.

Highly Pleased With Their Machines.

WON HIS MACHINE EASILY

Harvey Ferril was the winner of a motorcycle given away February 13. He secured only 141 subscriptions and was the highest, winning a $275 machine. Here is what he wrote:

Manager Motorcycle Campaign.

Dear Sir: I received my motor today and like it fine. It is just like you said it would be and I think if any person wants to deal with honest men, deal with you. I will send you a picture of my motor and me before long.—Harvey Ferril.

TOOK ONLY 110 SUBSCRIPTIONS

E. B. Preedy won the motorcycle in the campaign which closed February 28, by securing only 110 subscriptions, nearly all for only one dollar. He was the highest, with only $106.50. Think of it! He got a machine that sold then for $260, but he had the most subscriptions and the most points, and won. Here is what he says:

Manager Motorcycle Campaign:

Dear Sir: I received the motorcycle, and it is sure a dandy. It is easy to handle. I have not found a place it won't pull. I would advise every boy to get busy on the next campaign, for it is easy to win and everything is straight. —E. B. Preedy.

HE LIKES HIS MACHINE

Manager Motorcycle Campaign.

Dear Sir: I am writing to let you know I received the first prize motorcycle and sure am pleased with it. It sure is a dandy. It was worth working for, and I also say the way you managed the campaign was sure on the square, and I think others who may enter one of your campaigns will say the same, and I hope those who enter will win out as easily as I did.—C. S. Kelley, March 29.

MORE THAN PLEASED WITH HIS MACHINE

Manager Motorcycle Campaign.

Dear Sir: I received the motorcycle yesterday and I am more than pleased with it. I have ridden it about fifty miles. I want to thank you and the company for the machine and the promptness in sending it to me. The campaign was carried on absolutely fair and you did everything that you said you would do. My winning has caused great enthusiasm here among the young folks, and everyone thinks my machine is great. I am going to get my picture taken with the machine soon and I will send you one. Again thanking you for your honesty and kindness to me, I am, yours truly—Perle Tilley, May 12.

Box 3015 WATERLOO, IOWA

QUESTIONS AND ANSWERS

Continued from Page 163

years. And when the water receded it came on and grew as well as ever, so I could not recommend drowning for Bermuda grass. But it can be killed readily in the months of July and August by irrigating and letting it start to grow (or in other words, getting the tops full of sap); then plowing under deep and covering and then rotting down. This will cause the sap to ferment and rot the sod. If the work is well done it will make a clean job. Bermuda grass can not be killed in any way when it is dormant."

Salting Butter

How much salt is required for a pound of butter for commercial purposes?—Subscriber, Placerville.

This query was submitted to E. H. Hagemann, manager of creamery at Newman, and he answers:

"As a general rule one ounce of salt per pound of butter is required for commercial purposes. A little more or less can be used, depending somewhat upon the amount of moisture or water in the butter. If the butter comes hard and dry or is thoroughly drained of all water, a little less than one ounce per pound should be used, but if the butter seems to hold a good deal of moisture one ounce of salt per pound of butter should be used. It is best to use a little water with the salt when working the butter, as the water acts as a distributer of the salt and avoids mottled and streaky butter, which is invariably caused by uneven distribution of the salt. If 16 pounds of butter are to be worked one pound of salt can be used and one-half pound of water should be used with the salt. If a small quantity of butter is to be salted and worked by ladle it should be put into a wooden bowl where the water cannot run off easily until the salt is thoroughly and evenly incorporated. It can thereafter be drained off. If worked in a churn or butter worker, it should be so done and the drains closed for the first half of the working until the salt is evenly distributed, which results in an even color of the finished product."

Brush Cutters

Is it possible to secure a cutter for reducing prunings fine enough so that they may be plowed under the soil and ultimately aid in giving back to the soil fertility?—Subscriber, Lodi.

Such cutters are manufactured and offered for sale by Cultivator advertisers. The cost of brush cutter with two and a half horse power engine mounted on truck with four-inch tires complete is about $275.

Legal Queries

Louis B. Stanton, attorney, 243 Wilcox Building, Los Angeles, will answer legal queries in this department.

Immediate mail replies cannot be given except where fee to Mr. Stanton is paid. When replies are wished in Cultivator address query to 115½ N. Broadway, Los Angeles.

Unsigned communications receive no attention.

Title to Mortgaged Property

A loans B $3000. B has allowed interest payment to lapse and is unable to make further payments. B is willing to relinquish all his interest in the property in consideration of $100 being paid to him by A. How should A proceed to secure clear title?—Subscriber.

Care should be taken to bring down the certificate of title to the date of the deed, as upon satisfying the mortgage any lien or judgment subsequent to the date of the mortgage would take precedence over the deed, and, in fact, a deed issued subsequent to the date of the mortgage by the mortgagor would convey title to the property in opposition to the deed to the mortgagee.

ASSEMBLY FARMERS

The second annual assembly of the farmers of the Imperial Valley is in session in Imperial Saturday of this week. Dr. Forbes of the University of Arizona, Mr. Packard, Dr. Mead and others of the University of California will make addresses. This assembly is under the direction of the farm bureaus of Imperial County and is another manifestation of the live work being done by the farm bureaus and farm adviser.

BEAN POWER SPRAYERS

The Last Word

Wherever fruit is grown Bean Sprayers are known for their day in and day out efficiency—for their downright dependability—ease and economy of operation—low cost of maintenance—strength—durability—and all around satisfaction.

Thirty years experience in the building of Spray Pumps has firmly established Bean Spraying Outfits as the world's standard. The Bean is in a class by itself. Hundreds of testimonial letters from satisfied and enthusiastic users attest this fact.

This preference for Bean Outfits is not a mere chance. It is because growers the world over know that Bean Sprayers deliver and get results—that they are the last word in power sprayers.

Bean Exclusive Features

BEAN PATENTED AUTOMATIC PRESSURE REGULATOR—which ends all safety-valve troubles. Absolutely safe and certain. When nozzles are shut off the liquid is simply pumped back into the tank, without being put under pressure. Saves fuel and much wear and tear on engine and pump.

BEAN PATENTED THREADLESS BALL VALVES WITH REVERSIBLE SEATS—Simply bell metal balls which cannot stick, corrode or give trouble. Reached in two minutes without stopping engine and withdrawing liquid.

PORCELAIN-LINED CYLINDERS—Cannot be injured by any liquid.

NO STUFFING BOX—hence the source of much sprayer trouble is entirely eliminated.

UNDERNEATH SUCTION—which greatly increases capacity; never requires priming; and makes it possible to empty tank in a few seconds.

BEAN REFILLER—Fills 200-gallon tank in five minutes.

ECCENTRICS INSTEAD OF CRANKS—More durable than cranks and wear can be easily taken up.

BEAN ROCKING BOLSTER—Wheel on either axle can be in rut without tipping tank or springing frame.

DIRECT CONNECTED ENGINE AND PUMP—Saves power. Pump and engine are bolted direct to steel frame, giving perfect rigidity. Frame is bolted direct to axle, saving 6 inches in height and 150 pounds in weight.

INTERCHANGEABLE PARTS—All parts can be quickly and economically substituted for those that become worn.

NOVO ENGINE—The simplest, sturdiest, most efficient little engine on the market, and unsurpassed for sprayer use.

Bean Sprayers Made in All Sizes

We make a complete line of Power Sprayers at from $100.00 up—as well as Hand and Barrel Pumps, Nozzles, Hose and all Pump Accessories.

Our catalog describes the entire line and explains fully the new 1917 outfits. Send the Coupon.

CALIFORNIA CULTIVATOR'S

Thornless Blackberry Offer

Make Money Propagating This Valuable Plant

BE SURE to obtain at least one rooted tip of Cory's Mammoth Thornless Blackberry, the most highly prized of all the recently propagated California plants, and grow the plant yourself. The demand is widespread.

This wonderful plant has thoroughly proven its thornlessness and what is more it is the earliest berry to ripen and a prolific bearer of very large, luscious fruit, insuring quantity and excellence.

Affidavit is made by W. H. Squires, under sheriff Tuolumne County, that Cory's Thornless Mammoth Blackberry is not only thornless but he says is "far better in every way than the best you can claim for it".

How This Plant Was Propagated

Occasionally plant nature produces what botanists and horticulturists call a "sport"—an unusual specimen. That is what Cory's Mammoth Thornless Blackberry is. One thornless plant of unusual variety appeared without thorns in a stock of other varieties. It was carefully propagated and proved to be thornless and the rooted tips for seven years have reproduced thornless stock. Affidavits are furnished that the variety is thornless and several investigators have had it proven to their satisfaction that the variety is not only thornless but is a prolific bearer of very large fruit of a most delicious flavor. It is almost seedless. This berry is without doubt a most desirable plant to secure and propagate. The demand is very great.

In order to make it possible for more readers of this paper to secure rooted tips of this valuable variety, California Cultivator has made arrangements to distribute these plants while they last among its readers on the following offer:

Our Offer For each new subscription secured to California Cultivator at $1.00 per year we will send two (2) strong, hardy rooted tips of Cory's Mammoth Thornless Blackberry carefully packed in damp moss and specially made water proof paper.

Plant these the same as you would any other berry plant roots and with proper care many more will grow. By replanting you can soon have a patch of berries of unusual value both as to the sale of rooted tips and fruit. The supply now is small as compared to the demand.

Mr. Cory, propagator, makes affidavit to the following facts: Average product per hill is 15 three-quarter-pound baskets—shipping and keeping qualities superior to the well known Mammoth—has distinct flavor unsurpassed—is nearly seedless—canning qualities are of the best—CANES ARE AS FREE FROM THORNS AS THE GRAPE VINE.

Get your friends to subscribe for California Cultivator. Send us their subscriptions and we will send the rooted tips of Mammoth Cory Thornless Blackberries to you at the rate of two for each $1.00 in New subscriptions sent, or send $1.00 for your own renewal subscription, and 25 cents extra for postage and packing for one rooted tip.

Address all orders to **CALIFORNIA CULTIVATOR, 115-117 N. Broadway,** Los Angeles

Letters to a Beginner

Written for California Cultivator By Jean A. Koethen

NURSERY FEEDS

DEAR GEORGE: Do you remember Sue McComas, she that married Bob Jones the sawmill man's son? Well, she lived near us for a while, and one morning she came running to my back door, all out of breath and in great distress. Her baby chicks were dying, all had diarrhoea. Whatever could the matter be? I went over, of course, and there were her chicks, about 20 of them, out in the foggy morning, running about on the damp ground, and with absolutely no protection but that hen's wings. Not a box or barrel or even an old rug hung up between them and the chilly fog! "What are you feeding them?" I asked though there was certainly reason enough for a high rate of mortality aside from the feeding. Feeding? Why, they got scratch feed, the same the hen ate. Wasn't that all right for chicks? Now, honest, George, wasn't that just the limit? To think of that woman and she the mother of four, imagining baby chicks could thrive on the food the old hen ate! Would she give her three months' old baby beefsteak? There are a good many things baby chicks can eat, but scratch feed, or whole grain of any sort, except the very small ones, like millet, are not for them. I don't suppose Sue's chicks had eaten enough of that scratch feed to hurt them. I doubt if they could eat it. They were not getting anything except such tiny seeds or bugs as they could pick up in their excursions away from the hen.

There are plenty of wholesome nursery feeds. Mr. Philo says there is nothing equal to stale bread moistened with sweet milk. The Cornell station gives quite an elaborate mixture of grains and soft feed from the start. Eight pounds of rolled oats, eight pounds bread crumbs, two pounds sifted beefscrap and one pound of bone meal are mixed, and a small amount of this, moistened with sour milk, is fed five times a day to begin with, the number of feedings per day being gradually reduced to one at the end of four weeks. With this is fed a grain mixture made of three pounds cracked wheat, two pounds cracked corn, and one pound steel-cut oats, which is kept before the chicks in a little tray. In order that the chicks may learn to eat not only soft food and grain, but dry mash, a little of the dry mash which they are to have after the fifth day is mixed with the grain. This mash consists of three pounds each of bran, corn meal, middlings and beefscrap, and one pound of bonemeal, and is known as the Cornell mash.

The time-honored nursery feed—hard-boiled eggs (those tested out of the incubator) chopped shell and all, and mixed with an equal amount of stale bread—is hard to beat. Ii fact, the only objection to it is the expense, and if incubator eggs are used that is not great. I confess the Cornell way seems a little too elaborate to me. I like to use bread-and-egg for two or three days, meanwhile working the chicks gradually onto a ration of commercial chick feed, bran and rolled breakfast oats, the rolled oats being dropped when the bran is changed, at about the end of the first week, to the Cornell mash.

Rolled oats are a splendid "first feed," but they, like the bread and egg, are expensive. You can buy them in small quantities at five cents a pound, which is considerably cheaper than the price in boxes, and it seems worth while, when the number of chicks is not too large, to feed them for a few days. Steel-cut or pinhead oats are even better and are especially useful just at first when they can be scattered in the sand on the brooder floor. Being lighter in color than the sand they attract the attention of the chicks and keep them busy the first day in the brooder before other feed is given them.

But don't think, because I have mentioned these expensive feeds and elaborate rations that they are necessary Men who raise chicks on a large scale can't bother with bread and milk or bread and egg. They feed mainly, as far as I have been able to gather, some mixture of fine grains, usually one of the commercial chick feeds, and a chick mash such as is prepared by a good many concerns.

While the moistening of the mash with sour milk is highly recommended by more than one experiment station I don't believe many poultrymen practice anything but dry feeding. The use of the moist mash, while it does hasten growth, is attended with some dangers, and mixing it is a good deal of work. Most poultrymen keep the dry mash constantly before the chicks after three or four days and feed the dry grain in litter. Scratching in the litter keeps the chicks busy, and when the mash is always before them the weakest chick has the same chance as the strongest.

I am glad to know that your second hatch is doing so much better than the first.

Affectionately,

Aunt Jenny

TO OPERATE AN INCUBATOR

Prof. J. E. Dougherty of the University Farm at Davis is the author of Circular 156, of the agricultural experiment station, "How to Operate an Incubator." It will be of interest to every incubator operator. To secure it write to the Agricultural Experiment Station, University of California Berkeley.

GLENN COUNTY FARM BUREAU

The farm adviser conference will be held at Berkeley February 11 and 12. The dates between February 18 and 24 will be given to visiting various counties having farm bureau organizations. On Thursday, February 22, arrangements are being made for the entertainment of the farm advisers of the state, together with representatives from each of the farm bureaus of the state. On the night of Thursday, February 22, a special farm bureau meeting will be held at Orland. The meeting will be attended by visitors from over the state. All Glenn County members are invited to be present.

SELECT POULTRY BREEDERS NOW

Now is the time to select poultry breeding stock for next year. Select hens rather than pullets for breeders. Hens' eggs are larger, hatch a higher percentage, and the chicks are larger, more thrifty and stronger. In addition it is possible to know the egg laying record. Indications of a good layer are late molting, a bright red comb and faded beaks and shanks

Wonderful Egg Producer

Any poultry raiser can easily double his profits by doubling the egg production of his hens. A scientific tonic has been discovered that revitalizes the flock and make hens work all the time. The tonic is called "More Eggs." Give your hens a few cents' worth of "More Eggs" and you will be amazed and delighted with results. A dollar's worth of "More Eggs" will double this year's production of eggs, so if you wish to try this great profit maker, write E. J. Reefer, poultry expert, 4262 Reefer Bldg., Kansas City, Mo., who will send you a season's supply of "More Eggs" Tonic for $1.00 (prepaid). So confident is Mr. Reefer of the results that a million dollar bank guarantees if you are not absolutely satisfied your dollar will be returned on request and the "More Eggs" costs you nothing. Send a dollar today or ask Mr. Reefer for his Free poultry book that tells the experience of a man who has made a fortune out of poultry.—Adv.

The White Diarrhea Germ

White Diarrhea is caused by a germ, transmitted through the yolk, which multiplies rapidly after chick is hatched. There is scarcely a hatch without some infected chicks, and before you learn which ones are affected, they have infected the whole brood. The germs can be killed by the use of preventives and they should be given as soon as chicks are out of the shell. The only practical, common-sense method is prevention.

How to Prevent White Diarrhea

Dear Sir: I have raised poultry for years and have lost my share of little chicks from White Diarrhea. Finally I learned of Walker's Walko Remedy for this disease, so sent for two 50c packages to the Walker Remedy Co., Dr. 6, Waterloo, Iowa, (formerly located at Lamoni, Ia.). I raised over 500 chicks and never lost a single one from White Diarrhea. Walko not only prevents White Diarrhea, but it gives the chicks strength and vigor—they develop quicker and feather earlier. I have found this company thoroughly reliable and always get the remedy by return mail. Mrs. L. L. Tam, Burnetts Creek, Indiana.

Don't Wait

Don't wait until White Diarrhea gets half or two-thirds your chicks. Don't let it get started. Be prepared. Write today. Let us prove to you that Walko will prevent White Diarrhea. Send for 50c box on our guarantee—your money back if not satisfied. **Walker Remedy Co., Dr. 6, Waterloo, Iowa.**

Proper Use of Valuable Male Birds

By T. E. Quisenberry

MOST serious thought should be given by the poultryman to breeding pens. By this time the most careful breeders have planned their matings for the coming season. Take a long last look to make certain that you make no mistake. Your success for next season, and perhaps for several seasons, depends upon your matings for your 1917 hatches.

We would rather have one good male at a fair price than a half dozen males of questionable quality at a low price. A lot of surplus male birds of questionable quality kept around the poultry yard are a nuisance and a great expense. We believe that the average poultryman keeps too many roosters. If he has an exceptionally good male he should cross him on all the females possible. We would rather have one good male to breed from than a half dozen males of medium quality. The more hens you can cross on your best male the larger percent of high quality chicks you will have. It is a mistaken idea that a male has to mate with a hen for every egg which is fertile.

I made some tests along this line and found in the case of one hen, No. 896, that she was treaded by a male only once and the male removed from the pen and no other male allowed to mate with her. She laid eight eggs in the following 18 days and the last laid on the 18th day, everyone of them being fertile at the one treading. If it was not for the fact that a greater portion of male germs are destroyed by various causes and for various reasons after being deposited, a single copulation by the male would deposit enough germs to fertilize all the eggs laid by an ordinary hen in a year's time. The reason these eggs are fertilized in some cases for three weeks after a male has been removed from the pen is simply because some of the germs remain alive and active for that length of time in the oviduct or body cavity surrounding the ovary.

In this same test: Hen No. 115. The last fertile egg was laid on the 17th day after the male was removed. Hen No. 116 fertilized her eggs for 11 days after the male was removed. Hen No. 117 the last fertile egg which hatched was laid 19 days after the male was removed. Two of her eggs were fertilized on the 25th and 26th days, but the germs were weak and died. One egg was fertilized on the fourth day, and she laid seven eggs in the following 14 days, all of which were infertile; then fertilized another egg on the 19th day and again on the 25th and 26th. Hen No. 19, last egg fertilized was laid on the 13th day after the male was removed. Hen No. 121, last egg fertilized on 12th day after removing the male. Most of these hens were treaded only once and the male then removed. This indicates that if you have an exceptionally good male you could mate him to 20 or 25 females, give them all the range possible, feed and handle them as breeding stock should be handled, and you can expect reasonably good results. If a male has the right amount of vitality to fertilize a reasonable per cent of the eggs in a pen of ten females, he will take care of 20 just about as satisfactory.

Pound of Eggs for Pound of Feed

By C. T. Patterson, Director Missouri Experiment Station

FROM records of previous contests at this place the average hen weighs five pounds, consumes 75 pounds of feed, and produces 150 eggs per year.

The indications are that she uses three-fourths of the feed to supply her body and one-fourth to make eggs, and from each one-fourth pound of feed above maintenance, she makes two eggs, which weigh one-fourth pound, thus producing a pound of eggs for each pound of feed above maintenance, taking the year as a basis for averages.

The hens had feed before them at all times, and as the average hen consumes 75 pounds of feed, which is 1200 ounces, it will be seen that the hen's digestive capacity is 100 ounces per month, and that she averaged using 75 ounces for her body and for the other 25 ounces she made 12½ eggs which weighed 25 ounces.

Although we believe the hen's digestive capacity is about the same at all times, yet she does not produce the same number of eggs each month, which is accounted for by the proportion of feed required for her body at different times. If the weather is pleasant and other conditions right, the hen may use only 50 ounces for her body and make 25 eggs from the other 50 ounces of feed, but if the weather turns cold and her house is not what it should be so that 90 ounces of feed is needed for her body, she can make only five eggs from the other ten ounces, and if the weather changes suddenly so that 110 ounces of feed is needed to support her body, she can and does arrest the eggs which are partly developed, turn the egg material back into her own system and use it as food, which explains why hens stop laying on short notice after a sudden change in the weather.

These averages were obtained by using a large enough number of hens so that the individuality of the single hen was destroyed, which makes the average more accurate. It must be remembered that while some hens have a digestive capacity of only 80 ounces per month, others have a capacity of 120 ounces, yet the same rules governing maintenance and egg production apply.

The next question naturally is, "What can we do to lessen the quantity of feed necessary for the hen's body in order that a larger part of the feed may be used for eggs?". Where hens roost out during the winter with no protection from the storms they cannot digest any more food than is necessary to support their bodies. Therefore, comfortable houses economize food and make it possible for the hens to produce eggs in winter.

Another very important point is the balancing of the feed ratio so that the digestive system is not required to do unnecessary work. To illustrate, if a hen is fed 100 ounces of feed per month, only 60 per cent of which is properly balanced, the hen will appear healthy and hungry, yet produce no eggs, for it will be seen that her digestive system is burdened with the 40 per cent of the feed which cannot be used.

The condition of the feed, time and regularity of feeding, water supply, etc., are all important points to be considered.

One of the first points to be considered in breeding for egg production is to get a good digestive system for powerful egg organs and a weak digestive system will never make a high egg producer.

We might summarize as follows:

A hen's digestive capacity is limited; the number of eggs produced is determined by the difference between body maintenance and digestive capacity; maintenance is governed largely by conditions which the poultryman can control.

HOGS

Smith's Poland-Chinas—Sows and gilts bred to Joker, first prize boar at Wisconsin State Fair 1915. These sows and gilts were sired by Iowa Wonder, who is a son of the great A Wonder, the most celebrated Poland-China boar living or dead. Litters from this mating are the best I have ever seen anywhere. Prices low, quality considered. Will sell one or a carload. As a special inducement each purchaser will be given a year's subscription to the American Swineherd, the best swine paper published, and a copy of the Handbook on the Sow, also a copy of the Pig Feeders' Manual. Geo. A. Smith, Corcoran, Cal.

Grape-Wild Farm Berkshires — World's Fair Grand Champion Grand Leader 2nd heads our herd, not only himself a champion but the sire of champions. At the 1916 California state fair his daughters won all of the senior sow classes including the grand champion sow. At the 1916 Oregon state fair a Grand Leader sow was junior champion. We are offering a number of choice boars of exceptional breeding and are also booking orders for fall pigs. A. B. Humphrey, Escalon, San Joaquin Co., Cal.

Send for Free Catalog—Finest ever issued. Tells of the famous Whitten Ranch money making strain of Big Type Poland-Chinas. Make greatest weight in shortest time at lowest cost, topping market at 225 lbs. in 6 months. 600 head, both sexes, all ages, reasonable prices. Satisfaction guaranteed. Ranch in Tulare County, but address owner, R. H. Whitten, 610B Security Bldg., Los Angeles.

Billiken Herd of Chester Whites—The big prize winners at the 1916 California state fair. The breed that makes money for the rancher and dairyman. Have 4 nice young service boars left and 20 young open gilts that will be bred as desired by buyer. Write for the Chester White booklet that tells all about them. C. B. Cunningham, Mills, Cal.

Poland-Chinas—Twenty good gilts and three 2-year-old sows for sale. Either sired by or bred to I. B. A. Wonder, reserve champion at P.P.I.E. A few good young boars ready for service, sired by I. B. A. Wonder. A fine lot of fall pigs. I please you or refund your money. W. A. Young, Lodi, Cal.

Large Yorkshires—Choice spring boars, gilts and weaned pigs from champion sow P.P.I.E. or from breeding of champion boar and sow Sacramento, 1916. If you see them grow you will like them. Riverina Farms, Paradise Road, Modesto, Cal.

Superba World's Grand Champion Poland-China boar and one of the greatest sires of the breed. Spring boars ready for service, also few sows bred to this noted sire, reasonably cheap. Rough's Greenfields, Arlington Sta., Riverside, Cal.

BEST WAY TO BUY AND SELL

For selling poultry, live stock, nursery stock, and making exchanges of all kinds, readers of California Cultivator will find this paper produces splendid results. A. J. Robinson of Modesto writes us as follows:

"I wish to inform you that through your valuable paper I sold four bred sows at $60 each, these to go to the Whittier Ranch at Pixley, Cal. I have never failed to make a sale when advertising in your paper and wish to thank you for same."

Whenever you have stock to sell or when you want to buy consult California Cultivator classified columns. The cost for liners is only 3 cents per word per issue, with a minimum of 35 cents.

E. J. CHUBBUCK CO. 731 Market St. San Francisco, Cal.

A CEMENT STAVE SILO

We are pleased to have the opportunity of being the first publication on the coast to present to its readers a silo that is made of cement blocks, so constructed that they will make a perfect joint for every size of silo. We refer to the Playford Cement Stave Silo, the silo that has been used so successfully in the East and one that is sure to meet with a warm reception in the western country, where conditions for the preservation of silage is so ideally perfect.

Farmers are coming to realize the economy and benefits of using a silo, and with the advantages of this stave silo there will be an ever increased interest taken in that valuable asset to the dairying and stock raising industry.

Those who are interested in silos should write to the Cement Stave Silo Company 501 Call building, San Francisco, for a circular and other descriptive matter pertaining to this silo.

"Young man, the best tonic for you is the right kind of food. I suggest for Breakfast

Ghirardelli's Ground Chocolate

It's easily assimilated — it's extraordinarily nutritious — and it is supremely delicious."

It comes **PROTECTED**—as all chocolate should—in ½-lb., 1-lb. and 3-lb. hermetically sealed cans.

Since 1852 D. GHIRARDELLI CO. San Francisco

THROUGH the microscope, a spindle looks as rough as sand paper. That's where the rub comes. But the powdered mica in Mica Axle Grease fills up this unevenness, making a smoother, cooler bearing. That's why Mica does better work, and lasts twice as long. Get a can from your dealer today.

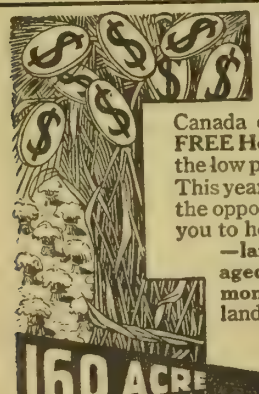
MICA AXLE GREASE



Raise High Priced Wheat on Fertile Canadian Soil

Canada extends to you a hearty invitation to settle on her **FREE Homestead lands of 160 acres each** or secure some of the low priced lands in **Manitoba, Saskatchewan and Alberta.** This year **wheat is higher** but **Canadian land just as cheap,** so the opportunity is more attractive than ever. Canada wants you to help **feed the world** by tilling some of her fertile soil **—land similar to that** which during many years **has averaged 20 to 45 bushels of wheat to the acre.** Think of the **money you can make** with wheat around **$2 a bushel** and land so easy to get. Wonderful yields also of **Oats, Barley and Flax. Mixed farming** in Western Canada is **as profitable an industry as grain growing.**

The Government this year is asking farmers to put increased acreage into grain. Military service is not compulsory in Canada but there is a great demand for farm labor to replace the many young men who have volunteered for service. The climate is healthful and agreeable, railway facilities excellent, good schools and churches convenient. Write for literature as to reduced railway rates to Supt. of Immigration, Ottawa, Can., or to

Household Department

TO MOPSA, AN ANGORA KITTEN

Little puss on my knee,
With your capers and glee,
Your persistence and pranks without end,
Do you know what a place,
With your songs and your grace,
You hold in my life, little friend?

You ball of soft fluff,
You are simply enough
To bewitch one, you charming wee sprite:
Like some midsummer fay's
Are your frolicksome ways,
Every movement so dainty and light!

When the stress and the strife
Of a strenuous life
Serve to ruffle my temper a bit,
Away worries fly
When to my mind's eye
Comes your innocent face, little kit,

With its crystal-clear eyes,
Big and round with surprise,
And the unruffled calm of a sphinx,
And two silk-tasseled ears,—
When your face thus appears
You banish all grouches, you minx.

You imp in gray fur,
With mellifluous purr,
When you cuddle up close to my breast,
You're a gay music-box
With a tune that unlocks
The doors of the chambers of rest,

For your soft lullabies
Seem to quite hypnotize,
And my eyelids make heavy as lead—
O such a fine nap
With you on my lap
Or on the chair-back at my head!

O who could be blue
With a madcap like you
To provoke one to laughter and mirth?
In spite of myself,
While I watch you, you elf,
I forget every trouble on earth!—Our Dumb Animals.

"L'AIGLON"

"YOU'RE L'Aiglon, are ye? An aristocrat, eh?"

The old man plunged his hands into a basin of water and suds, and bent himself vigorously to the task of washing his face, hands, and hair, an exercise, from which he presently rose dripping and rosy, but still belligerent. He breathed deeply into the folds of the kitchen towel hanging from the roller behind the door, while he rubbed his ruddy cheeks and nose until the shining roundness denied beyond possibility of question the genuine quality in the tones directed toward a tiny fluff of gray, winding between his legs.

"Got a pedigree—and was raised in a cattery, was ye?"

"What's a cattery, anyway?" he asked, raising his voice, and giving a final rumple to the low-lying and aggressively upstanding hair.

A little old woman appeared in the doorway, and stood regarding the unusual irritation plainly visible in the voice and attitude of her spouse.

"Why, pa, a cattery is a house where they raise cats—An—Ango-r-r-a cats—'cause some of 'em is awful expensive. You know what Clara said about that one that cost $500," she continued, her voice sinking to an awed whisper; "and she said L'ai—'laigg—loo—"

"What a name for a cat!" exclaimed the old man. "I hate such tomfoolery. I just naturally despise it. He can go back where he come from. The old cat's good enough for me. She's caught all the mice round here for a considerable lot o' years, an' I ain't goin' back on her for any upstart, named L'Aigloo."

"'Tain't as if we couldn't change it; you know Clara wrote what it meant, and how to pronounce it, but she said we must suit ourselves about callin' him that. She said it's French, 'cause his father and mother was French—an' his grandfather—"

"His grandfather be—" Even in his disgust, the old man paused upon the brink of this ejaculation.

"My sakes!" exclaimed ma. Picking up the kitten, she fled to her remotest "piny" bed. "My sakes!" she repeated to the fragrant globes of pink and white.

Left thus, the old man peered through the window at the fugitives. He rubbed perplexedly at the high light on his polished bald head.

He opened the door of the cupboard and took out a small plate, muttering, "Cattery—pedigree—we'll see!" and other dissatisfied fragment. A brown paper parcel came forth from one of the shelves, and he untied it with fingers that fumbled clumsily at the knots. Unrolled, it disclosed a portion of liver, fresh and inviting.

The old man cut narrow strips of liver, and placed them carefully on the plate. Then he spoke to the old cat.

"Come on!" he said, ingratiatingly "Come on an' get it." He went close to her and stroked her with his great rough hand.

"It's fresh," he declared. "Ye can smell." Thus importuned, the old cat rose slowly, stretched, yawned, sniffed once and again, arched her back under the rough caress, then turned indifferently to her cushion, from which she blinked unresponsively at him.

"Ye hain't eatin'," he said, "sence mornin', an' it's night supper time. 'Pears like ye'd be a-wantin' something."

But she did not heed him. Blind to the solicitude of the bent old shoulders, from which stretched the tremulous arm, with its offering, she turned away, and began washing her face imperturbably.

Outside the window he could see the "pinys" waving in the breeze, as the little old woman walked among them. Upon a riotous kitten, curveting in their midst, up and down the gravel walks, they sent down showers of radiant petals.

"Little rascal!" the old man muttered, with absorbed interest at the leaping antics. "Mebbe he — like enough—"

The sentence remained unfinished as he walked toward the door, and there halted, gazing ruefully downward.

"L'Aigloo—cattery! Such nonsense, an' I ain't agoin' to put up with it," he announced, but the strength and finality of purpose that had rung through former utterances were lacking now.

"Them chickens'll be hungry, anyway, I reckon," he confided to the depths of a wooden pail hanging on its peg in the wood shed.

"Ma an' me an' the old cat's gettin' a little bit rickety, but them chickens," he said, hopefully, "they're young and spry; they'll eat."

But they stood about in indolent, surfeited groups, regarding him with friendly affability, all unheeding the handful after handful of golden grains he threw among them. In dejection, the path by the currant bushes back to the house was slowly retrod—and the dejection deepened as he stood again in the kitchen.

It came to him suddenly that he himself was not hungry, and that he was tired—tired of looking at things he had seen so often, the roller towel, the dishes, the old cat. There was nothing for him to do, no one he could serve.

A plaintive quaver of sound arrested this melancholy turn of reflection. On the floor before him stood the son of flawless French pedigree, appealing like any plebian, plainly, obviously hungry.

The man opened the cupboard door. "I don't aim to have anything starvin' round me," he said to the plate of liver, lifting it from the shelf.

"Here you, L'Aigg-loo;" he pronounced the name with labor and distinctness. "Ye can have it, for the old cat don't want it. I give it to her first," he felt it necessary to explain.

L'Aiglon came to the feast; he was not particular who was invited first. In a moment, it seemed to the delighted old man, there was no vestige left, and the kitten searched industriously for more round the plate.

"Want some more, do ye? Well, if you don't beat the dickens." A few moments later, he added, with an ecstatic grin, "I don't reckon ye can hold any more, but if ye can—"

L'Aiglon had finished it, and was asking for more.

"Nigh starved, ain't ye?"

The basin stood in the sink and he poured it full of water, as if in the joy of giving he feared something empty might wish to be filled. Again he scooped great handfuls up to his face, and emerging red and chuckling, he beheld ma standing apprehensively in the doorway, viewing the still unappeased kitten.

"That there kitten," he said, impressively, striving to find words to maintain his former declarations, and to explain his too evident abandonment of them, "is the biggest little pig I ever see."

The towel hung conveniently near, and he buried his happy face in its folds.—Youth's Companion.

HOUSEHOLD QUERIES

Everlasting Yeast

Please give directions for making everlasting yeast, the kind of which you keep a little back for a starter —L. T.

One-half cup white granulated sugar and one cup of flour; stir to a batter and let stand three days in warm place to rise. On the fourth day stir up the sponge and let stand over night and rise, then take out a cup of the sponge, put into a quart jar, add four tablespoons of sugar and set in a cool place until you are ready to bake bread again. Don't put salt in the yeast that is saved for baking next time. This yeast makes fine bread.

Grapefruit Marmalade

Please give recipe for grapefruit marmalade, also other ways of serving grapefruit.—Subscriber, Buena Park.

We do not have a recipe for marmalade where simply the grapefruit is used but give the following receipe for "Amber Marmalade." One grapefruit, one orange, one lemon, seven pints cold water, five pounds sugar. Wash and wipe fruit with a soft cloth, cut each in quarters, then cut each quarter through peel and pulp into exceedingly thin slices, discarding the seeds. Pour the water over the prepared fruit and let stand overnight. Cook until the peel is very tender; it will take four or five hours. Again set aside overnight. Add the sugar and cook, stirring occasionally, until the syrup thickens slightly on a cold dish. Store in glasses, cover with paraffine when cold.

Every girl should be taught how to make and keep a home. This includes the wise purchase and manufacture of dress goods and clothing, sanitation in the home, healthful foods, and how to cook them, care of the sick, etc.

DIFFERENT WAYS OF COOKING CHICKEN

Broiled Chicken

A young chicken should be used for this dish. After cleaning, cut in two through the back, flatten out, dry well with a clean towel and place between broiler irons over a nice, clear hot fire. After the pieces have become thoroughly hot, butter them well, sprinkle with salt and pepper and continue broiling, turning often: it will take fully 20 minutes. Serve on a hot platter.

Pilau

One chicken, one large onion, two cups cooked rice, two tablespoons lard or butter, two tablespoons flour. Prepare the chicken as for frying, flouring it. Into a saucepan put the fat, when melted add the flour and allow it to brown. Add the chicken and cook until brown then fill the pan one-fourth full of water, add the onion, salt and pepper. One cup of washed rice (this will make two cups of cooked rice) should be added when the chicken is almost tender. Set on the back of the stove and simmer gently until the chicken is tender, about three hours.

Italian Style

Take a nice chicken, cut into small pieces and fry in a little olive oil, a medium brown. Chop very fine a little parsley, two cloves of garlic, half onion and quarter teaspoon of allspice. Put a little olive oil in a sauce pan, then the browned chicken and parsley, garlic and onion. Then add about a pint of tomatoes. Have ready some dried mushrooms which have been boiled about 15 minutes. Now put in mushrooms and their liquid. Salt and pepper to taste. Boil very slowly about one and a half hours, stirring constantly. A little water may be added if too thick.

Creole Chicken

Southern cooks understand chicken cookery as few others do, and this stew is one of the best chicken recipes. Singe and draw a good sized fowl and disjoint it carefully. Melt two rounded tablespoons of butter in a deep saucepan. Add three onions sliced thin, and stir until the onion is thoroughly cooked, but do not allow it to burn or even brown deeply. Add the chicken with the dark meat on the bottom and the white meat on top, a dash of celery salt and just enough of the juice from a can of tomatoes to cover the chicken. If the chicken is large, this will take an entire quart can of tomatoes pressed through a sieve. Bring to the boiling point, and then push back on the stove to simmer very gently for one hour. Season with a small teaspoon of salt and a mere dash of pepper. The Southern cook adds a sweet red pepper, with the seeds removed and the shell chopped very fine. Next add one can of corn, or if you can secure it, one pint of corn cut fresh from the cob. Heat this thoroughly. Edge a hot platter with plain boiled rice. Lay the chicken neatly inside of this border and pour over it the corn and tomato sauce.

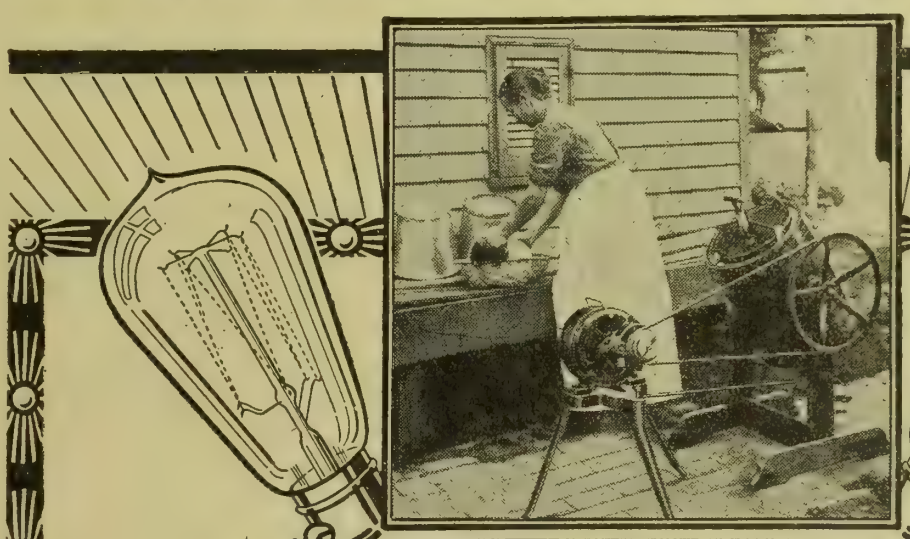
Mother's Chicken Pie

Pick a fat hen and wash and cut up, put into boiling water that has been seasoned with salt, and cook until tender. To make the dough, sift together thoroughly one quart of flour, one level teaspoon of soda, one teaspoon baking powder and salt as desired. Add enough lard to make a short crust, and sour milk to mix dough as thick as for biscuits. Roll on a well floured surface, making the dough as thin as can be handled, and place it in a bread pan, covering bottom and sides. Put chicken in the pan, adding butter, pepper and salt if necessary. Pour in the broth, which has been slightly thickened with flour. Add top crust, making perforations to allow steam to escape. Bake in quick oven. If there is any broth left, make a gravy, adding sweet milk, butter and a little onion juice. Thicken with flour and pour over top of pie.

Chicken Tamales

Meat from half of a boiled chicken; one clove garlic or half medium sized onion; quarter teaspoon cayenne; one teaspoon salt; one cup corn meal; two or three small red peppers. Chop the chicken; season with cayenne pepper, garlic, or the onion finely chopped, and salt; form the meat into little rolls about two inches long and three-fourths inch in diameter. Pour boiling water over the meat and stir; use water enough to make a thick paste. Take a heaping tablespoon of the paste, pat it out flat, and wrap a roll of chicken in it. Wrap each roll, so treated in tender corn husks that have been softened by being placed in a pan and covered with boiling water. Flatten the rolls with a pressure from the palm of the hand, tie the ends and pack in a granite pan or bucket, in which they are to be cooked. Cover the tamales with the broth in which the chicken was cooked, or with boiling salted water. Add two or three small sharp red peppers, and boil for 15 minutes. The Mexicans add a little of the pepper finely chopped to the meat filling of the tamale, which with them is often made of beef or pork, boiled tender and chopped fine.

DELCO-LIGHT

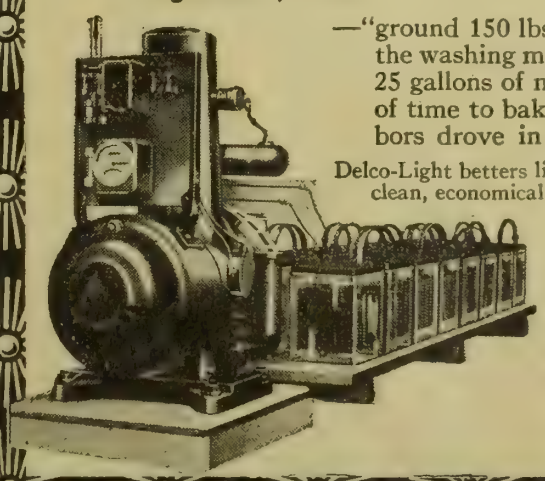


ELECTRICITY FOR EVERY FARM

All In The Day's Work

Delco-Light actually pays for itself in time and labor saved in doing the household chores.

Here is a sample day's work for Delco-Light, on the farm of A. L. Denlinger, near Engelwood, Ohio.



—"ground 150 lbs. of sausage meat—churned 90 lbs. of cream—turned the washing machine and wringer for large family wash—separated 25 gallons of milk. And after all of this work, my wife had plenty of time to bake bread. During the evening, some of the neighbors drove in and we had a pleasant time under Delco-Light."

Delco-Light betters living conditions on the farm. It furnishes an abundance of clean, economical, safe light for house and outbuildings. It makes possible a modern bath and running water in various parts of the house, and it furnishes power for small farm machines.

Delco-Light is a complete electric power plant—wonderfully compact, economical and efficient—and so simple that a child can care for it.

The Irishman's advice to a long winded speaker: 'When yer get through pumpin', lave go the handle.'

KEEPING UP ONE'S WARDROBE

Written for California Cultivator
By M. A. T.

After purchasing a pair of kid gloves, select a spool of cotton of the same shade for darning them for if they are darned as soon as they begin to rip they will repay their wearer by a long lease of service.

Ribbons, veils and laces will last longer and look far daintier if they are never creased by folding; they are easily kept smooth by winding over a roller. Gloves should be blown up immediately after stripping them from the hand, then filled with a light shake of glove powder and laid away without folding.

If a soiled spot is found upon a woolen garment, set a small pan of gasoline in a pan of very hot water and use the fluid warm, and it will remove the soil more readily and without leaving a ring around the spots.

White waists and dresses that are worn in the winter soon become soiled and I have found that they can be cleaned with very little rubbing by putting them to soak in warm suds made with borax soap chips, as this softens and whitens the fabrics and it is the rubbing that wears them out much sooner than the wearing. There is nothing better than the soap chip suds for washing lace collars and all small laces, and for all kinds of nice socks and stockings and these wear longer if they are laundered frequently than when they are put away moist with perspiration, as this rots any kind of fabric. Any white woolen article will come out as clean and soft as when new by washing through the soap chip suds and then rinsing in water slightly blued.

If you have several pairs of good stocking legs with worn feet, it will certainly be worth while to get new feet for them. It takes only a little while to sew the feet on to the stockings tops and you have a pair of stockings that are as good as new. Give added length of days to kid and other leather shoes as well as keep them black and soft by rubbing often with a little vaseline on a soft cloth. One of the best shoe polishes is made by mixing lamp black with the vaseline; this can be bought for a trifle at any drug store.

A KITCHEN CONVENIENCE

Probably there is no simple thing about the housekeeping that gives such "quick results" for the same expenditure of time as the covered broom, says Alice Margaret Ashton in the Northwest Farmstead. And yet to many housewives it is still personally unknown. It is one of the innovations that do not cost a cent.

But I valued the covered broom in other departments of the house long before I realized its usefulness in the kitchen. Now I keep a broom covered always in readiness for that room. For the kitchen broom I like soft, old knitted undergarments, which I pin securely in place with safety pins; this does not look as neat as the regular broom bag, but it answers every purpose.

When I put a fresh cover on the broom I first use it to carefully brush the walls and ceiling free from possible webs and to dust all the doors and other woodwork of the kitchen thoroughly. It is then used to sweep the floor for two or three days.

The kitchen looks neat with very little other dusting, besides this triweekly "brooming", which is a big item to consider with a woman whose hands are crowded with duties.

The covered broom removes the dust from the floor as no uncovered broom can, making it look neat and presentable without such frequent moppings.

The soiled covers are shaken as free from dust as possible and then put in the washer after all the other clothes have been washed. Try the covered broom in the kitchen if you do not already use it there.

"PON HAUSE"

Although it is rather late for butchering this old fashioned recipe given by the Colorado Agricultural College may be of interest:

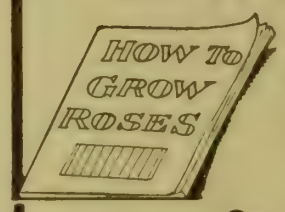
"All meat not used for sausage, hams, shoulders and side meat may be placed in a kettle to be cooked for 'meat pudding.' This includes the head, with tongue, heart, liver and all clean skins after lard has been stripped from them. To these trimmings add water and cook slowly until very done. Remove bones and largest pieces of meat, cut the meat into small pieces and place again in the kettle. Add water and thicken with cornmeal and buckwheat flour, about equal portions. Cook slowly, stirring constantly, season to taste with salt, pepper and sage. When done pour in dripping pans. When firm, slice down. Serve cold or fry as mush."

That housekeeper is most efficient who by the simplest methods best conserves the health, happiness and resources in her keeping. It is she who coordinates mental and manual. In this age the manual is being rapidly taken out of the home by the use of many new inventions which our grandmothers never dreamed of, and the mental is being rapidly ushered in. Today our housekeeper must be a cook, a laundress, a clothier, a doctor, a teacher, a house furnisher and decorator, a finance committee, and a social worker.

Confidence is a great asset. The fact that our people have confidence in their neighbors and in the country to adjust its financial system and marketing difficulties is all the assurance we need for prosperity.

Superb California ROSES

To Women:



When the men folks are ordering fruit trees, vines or plants from the Fancher Creek Nurseries, have them include a few of our hardy field grown roses for you. We have a splendid assortment for this season's planting.

"How to Grow Roses"

One Copy Free for You

This book by our Mr. Geo. C. Roeding is the result of 33 years' experience as a fancier, practical grower, student and rose lover. It contains just the kind of information that every person interested in roses must have in order to get the very finest results. Readers of the Cultivator are offered this book free for the asking.

SEND TODAY FOR YOUR COPY

The edition is necessarily limited, so we suggest that you write now. A postal will do.

PEACH PRICES

The California Peach Growers announces price list No. 6. Please note the following advance in prices, effective Saturday, November 18, 1916, at 6 p. m. All prices are f.o.b. factories, California common points, but no orders will be confirmed by us, at the following prices, unless f.o.b. factories where grades and varieties desired are available. All quotations are subject to our approval of variety and assortment, subject to our confirmation and subject to advance without notice: November, December and January shipment.

Price list No. 5 is hereby withdrawn, and ineffective after 6 p. m. Saturday, November 18, after which time prices herein quoted shall apply.

	Yellows.	Muirs.
Standard Peaches	.06¼	.06¼

Citrus Fruit Market

LOS ANGELES, Feb. 7, 1916.

Exceedingly cold weather given in Eastern sections has prevented some marketing. The market in general, however, is good. Variation in prices is great because of injured fruit being severely cut, and high grade stuff is in keen demand.

Lemon prices are much more satisfactory than for some time.

Shipments

Shipments of oranges from Southern California to date since November 1, 1916, oranges 5826 cars, lemons 1323, total 7149; to same date last season, oranges 4566, lemons 1400, total 5966. From Central California to date this season, oranges 3965, lemons 143, total 4108; to same date last season, oranges 4142, lemons 141, total 4283. From Northern California to date this season, oranges 842; last season 609.

About Baby Chicks' Health and Growth and your PROFITS

Sperry Gritless Baby Chick Feed contains the food values and constituents which Nature has taught the mother to scratch for her chicks.

That's why thousands of chicken raisers are enthusiastically feeding it. They know that to make money in the chicken business they must save a big percentage of each hatch. They have proved that chicks fed from the outset on **Sperry Baby Chick Feed** (packed only in yellow striped sacks) live, thrive and develop into healthy, strong chickens.

Information about the feeding and care of your baby chicks and many dollar making pointers are given in our booklet, "Makes Hens Happy." Get your copy by writing your name on the coupon and mailing it today. It's FREE.

Sperry Poultry Foods are made in a Special Mill at Stockton by the Sperry Flour Co.

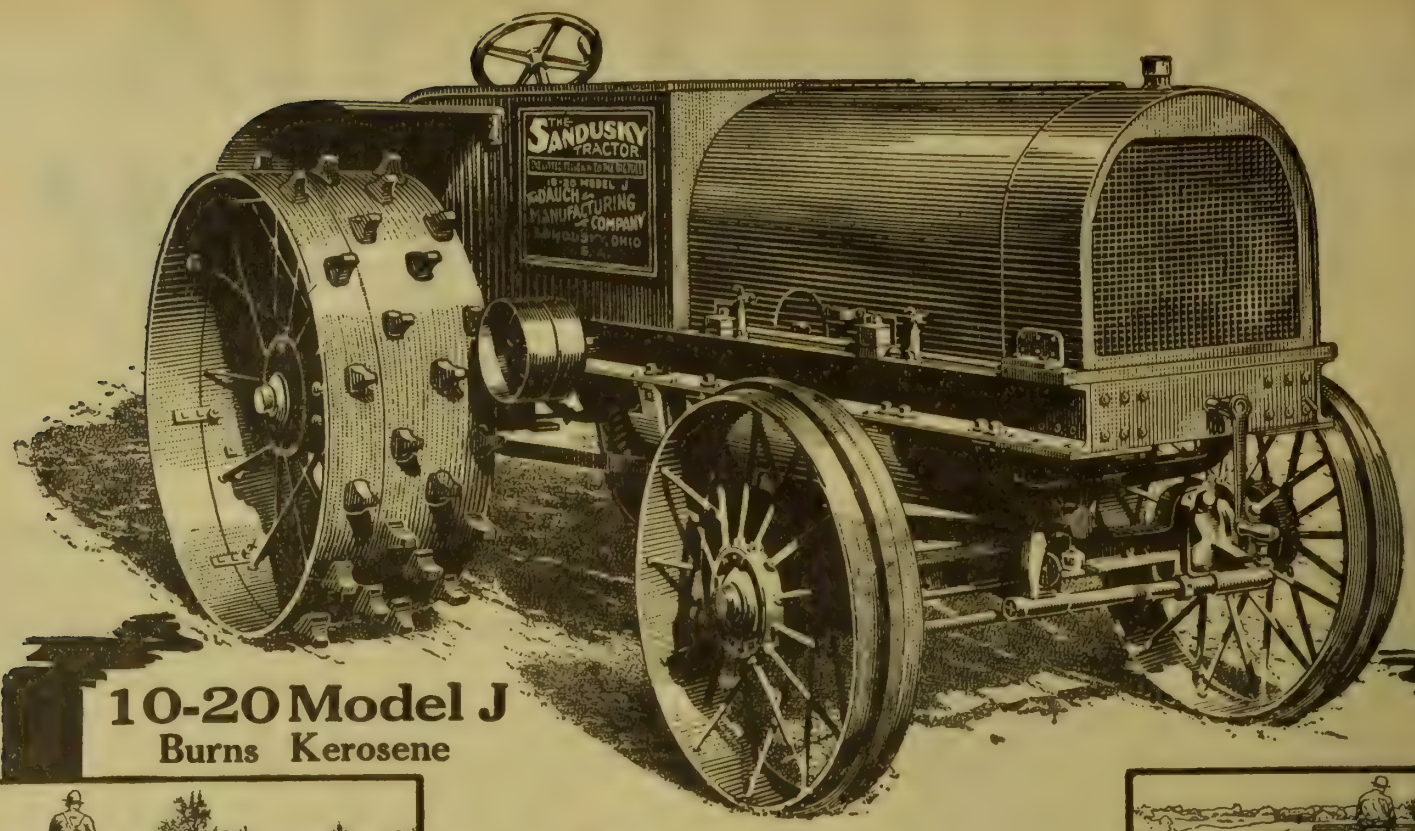
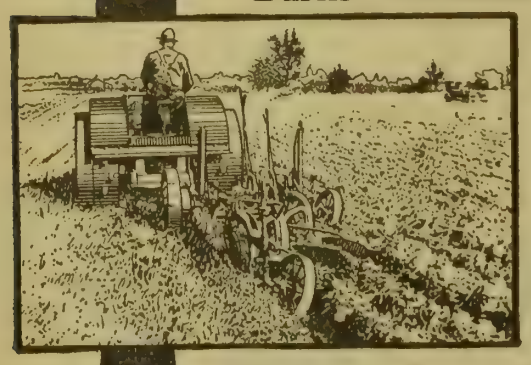
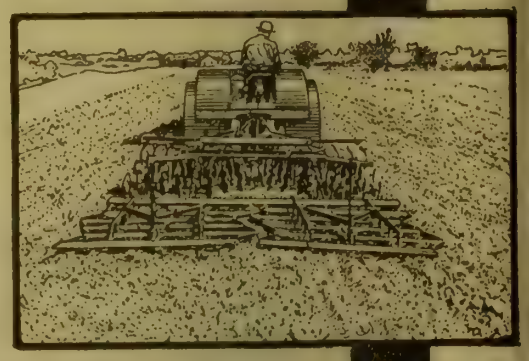
A Napa County Quartette



10-20 Model J
Burns Kerosene



$1095.00 F.O.B. SANDUSKY.



THIS 10-20 Model J Sandusky Tractor places the farmer with lesser acreage on the same basis of economy as the man with the larger farm.

Gives him proportionately the same dependable service, produces the same results in dollars and cents and effects the same economies of labor as secured by the hundreds of farmers operating our 15-35 Model E.

Pound for pound the Model J is as good a tractor as our larger machine. It is designed on sound engineering principles, built with the same mechanical precision, of the best materials and proved out thoroughly in actual field work.

It is sold strictly on a guaranteed basis, after an actual demonstration *on your farm* has shown that it is profitably adapted to your needs and capable of doing your work. You buy tractor certainty when you buy a Sandusky, and you get it at a reasonable price.

BRIEF SPECIFICATIONS

Our own four-cylinder, four-cycle, 4½×5½ motor; drop forged crank-shaft, cam-shaft and connecting rods, interchangeable high grade bearings; combination force feed and splash oiling system; high tension magneto; Bennett air cleaner; belt pulley; three speed transmission; Timken worm and gear drive; Hyatt equipped; universal couplings between motor, transmission and differential; three-point spring suspension; thorough protection against grit; full steel construction; short turning brakes. Weight, 4000 pounds; wheel base, 76 inches; height, 52 inches.

BOOK J-13 FREE

It describes fully the unique principles of design, the construction and performance of this smaller "Little Fellow With the Big Pull." Also gives the details of our "Try It Before You Buy" sales policy, as well as covering our broad, binding guarantees. Tell us your problems, and we will gladly assist you in solving them without obligation on your part. Be sure to ask for Book J-13

A NEW PLAN—FREE SERVICE

We announce an entirely new departure in tractor selling. A coupon book good for 100 hours of service goes with every Model J. This means expert service and help without charge when you want it. See catalog for details.

If your work requires more power than furnished by Model J let us send you catalog covering our 15-35 Model. Ask for book E-13

TO DEALERS—We want men of standing, with pep and energy, to get behind this 10-20 Model J and push it. Write for our proposition.

A County of Compact Resourcefulness

Napa County, Where Prunes, Grapes, Cherries and Many Other Fruits Grow to Perfection. A County Where More Intensive Farming Generally, and Live Stock Interests Especially, are Being Encouraged. Statements of Resources by Adviser Baade and the Cultivator Representative, C. A. Briggs

"COUNTY of Compact Resourcefulness" is claimed as a slogan for Napa County. In the entire county there are less than 800 square miles. The rich bottoms along the streams which drain into San Francisco Bay afford opportunity for most intensive culture, and since '49 this intensive culture has been followed in much of the county—not to the extent it should be, however, and today with more capital, better equipment and better and more folks there is opportunity for vastly increasing the output of these rich acres. The Cultivator representative, C. A. Briggs, has used his little Ford auto to penetrate every section of the county and learn as to how many and how well cared for are the live stock.

Putah Creek Bridge

There are some horses, more cows, a few sheep, still more hogs, yet the animal industry of Napa County is still in its infancy, that is animal industry from a modern standpoint. In the days of hides and tallow there were cattle on these rich lands, but they gave way to the grain fields and later to the fruit orchards, and fruit has been the queen for many years. "The finest wines in the world are Napa's; we have proved it at expositions." "We grow the finest prunes and in pears we are not excelled; in cherries ours are among the largest, earliest and sweetest."

To summarize, we note that in the county there are almost 5000 acres of bearing orchards, 12,000 of vines; of figs to supply the San Francisco market there are nearly 1000 acres; in good old time back East corn there are 2400 acres; as yet only 1400 acres of alfalfa—this should increase—and while it is not a commercial citrus producer there are said to be over 250 acres of olives, lemons and oranges in Napa County.

How may these rich lands be made to supply more of the food which San Francisco and some of the Eastern sections demand? That is a question which Farm Adviser Baade, Horticultural Commissioner Fox and a lot of other people are endeavoring to solve, for there are in the county 512,000 acres, of which only 102,000 are cultivated. Some of this is mountainous as its wonderful scenery proves, but even there live stock flourishes, and as live stock is becoming more profitable and more attractive we leave the remainder of the story of Napa and its live stock interests to Mr. Briggs. But first a short statement as to live stock interests in the county by Farm Adviser Baade.

Hillside Orange Grove in Napa County

Sheep in Berryessa

LIVESTOCK IN NAPA COUNTY

Written for California Cultivator
By H. J. Baade, County Farm Adviser

THE livestock industry in Napa County has had a varied history. During the early days, we are told, our hillsides had wild oats growing on them four and five feet high. This made plenty of feed for the grazing of livestock; cattle, sheep and horses. As the population increased, the quantity of livestock increased also, with the result that the hills were so closely pastured that the grasses and wild oats were practically killed. So today such sights as are described to us of former years are no longer in evidence.

The White Scale

Written for California Cultivator By James Boyd

TODAY but little is heard of the white scale, Icerya purchasi, but 30 years ago it occupied a great deal of time at all meetings of horticulturists. The story of the white scale and its practical extermination is one well worth being repeated and perpetuated. The white scale was the most dreaded and destructive scale that the orange grower ever had to contend with.

It was first introduced into California about 1868 by Geo. Gordon of Menlo Park and appeared in several places north and south about the same time. It first began to be noticed in the early seventies. It seemed to be proof against all ordinary insecticides, and while it had full sway increased enormously fast. The only safety for the orchardist lay at that time in the comparatively isolated and scattered groves. This was before the days of fumigation and when experiments were being made with it. Fumigation, it was reported, killed the trees. The various kinds of washes seemed to have no effect on it. It would also stand a greater degree of heat than any other scale. Heat and steam were tried with the result that the tree was injured and the scale unhurt. The kerosene emulsion and the various rosin washes were harmless to the scale. Infested trees would not bear after the third year after being infested and would then speedily die.

This was the state of affairs until a State Fruit Growers Convention was held in Riverside in connection with a citrus fair in April, 1887. At that meeting Prof. C. V. Riley, United States entomologist from the Smithsonian Institute, Washington, D. C., in speaking on the subject of insect pests had the following to say in regard to the white scale. Australia he said was the home of the white scale. Nothing was known of it prior to the seventies. It appeared almost simultaneously in Australia, Africa, and America. "The white scale," he said, "has greater powers of locomotion and accommodates itself to a greater variety of plants and survives longer without food, which makes it one of the most difficult species to contend with. No bird of California is known to feed on it, and of true parasites, none have hitherto been reported. Albert Koebele reported making many experiments to exterminate it without results. Caustic soda would not kill the eggs when it killed the bark and burned the leaves. Prof. Coquillett also experimented without any result.

"It has doubtless occurred to many of you that it would be desirable to introduce from Australia such parasites as serve to keep this scale in check in its native land. This state, even this county, could well afford to appropriate a couple of thousand dollars for no other purpose than the sending of an expert to Australia to devote some months to the study of those parasites there and to their introduction here. The result for good in the end would be a million fold. I would not hesitate as United States entomologist to send some one there with the consent of the commissioner of agriculture were the means at my command, but unfortunately the mere suggestion that I wanted $1500 or $2000 for such a purpose would be more apt to cause laughter or ridicule on the part of the average committee of Congress than sorrow or earnest consideration, and the action of the last congress has rendered any such work impossible, limiting investigation to the United States. The white scale is the most difficult to master. One thing is sure, it is pure folly to think of giving up the battle. Permit me to congratulate you as a board on the good work already done and to prophesy that in future years when the fair and unrivalled fruits of the Coast shall have been multiplied beyond the most sanguine vision of any of you and have found their way in one form or another to consumers in all parts of the world the people of California will gratefully remember the work you have instigated and the battles you have fought."

In speaking of Prof. Riley and his work the Press and Horticulturist remarked: "One of the gratifying results of Prof. Riley's visit is the assurance that the United States government is now to assume local and continual control over our insect pests.

At an international exposition at Melbourne, Australia, Albert Koebele was sent out to attend and look for a remedy for the white scale. The result was that he sent three kinds of parasites, one of them, the vedalia cardinalis that was very voracious, preying on the white scale both in its larval and adult states. These were sent and distributed by Prof. Coquillett wherever most needed.

The Press and Morticulturist under date of February 8, 1890, reports: "Since the perfect destruction of the white scale in Los Angeles County the orange trees in the older orchards are making a very fine growth and prospects are good for a very large crop in that county after this season."

The Navel Orange in Brazil

THE department of agriculture is giving out a bit of information regarding the early history of the Washington, or Bahia, Navel, from which we quote:

"All the evidence points to the fact that the variety of navel orange now so largely grown in this country first came into existence at Cabulla, a suburb of Bahia, Brazil, early in the nineteenth century, as a sport from the Selecta orange. The latter variety is still grown extensively near Bahia and in other parts of Brazil and some of the trees show a marked tendency at times to produce fruit

with well developed navels. Such fruits, however, are not seedless, though the number of seeds is relatively small. The navel variety has almost entirely supplanted the parent variety about Bahia, where it has been known for over 100 years. In the vicinity of Rio de Janeiro but few trees of the seedless variety are grown.

Origin of the California Stock

It was from the plantation of a Senor Teizeira, near Bahia, so far as can be determined, that the budded trees were obtained through which the navel orange wood was introduced into the United States 45 years ago. Several trees were gotten from this plantation by a Presbyterian missionary, the Rev. F. I. C. Schneider, and shipped to William Saunders, then horticulturist, landscape gardener, and superintendent of grounds of the United States department of agriculture. Mr. Saunders grew the trees in the department greenhouse, and trees propagated from them were distributed to California and Florida. The variety proved to be unsuited to Florida conditions, but in California it is very productive and highly valued. Almost the entire present planting of the variety in that state can be traced directly back to two of the trees sent there in 1873.

Culture in Brazil

The navel orange in Brazil, unlike its descendant in California, grows under warm, moist conditions. Seedlings of the bitter or sour orange (citrus aurantium) are employed almost exclusively as stocks, and the navel orange wood is propagated on them by shield budding. The trees are usually planted on the tops and sides of low hills. About the only cultivation practiced consists in clearing the land of weeds with a heavy hoe two or three times a year. Some of the owners of the larger groves are beginning to manure their trees. Many insects and diseases attack Brazilian oranges, but of these only a species of ant is, in general, combated.

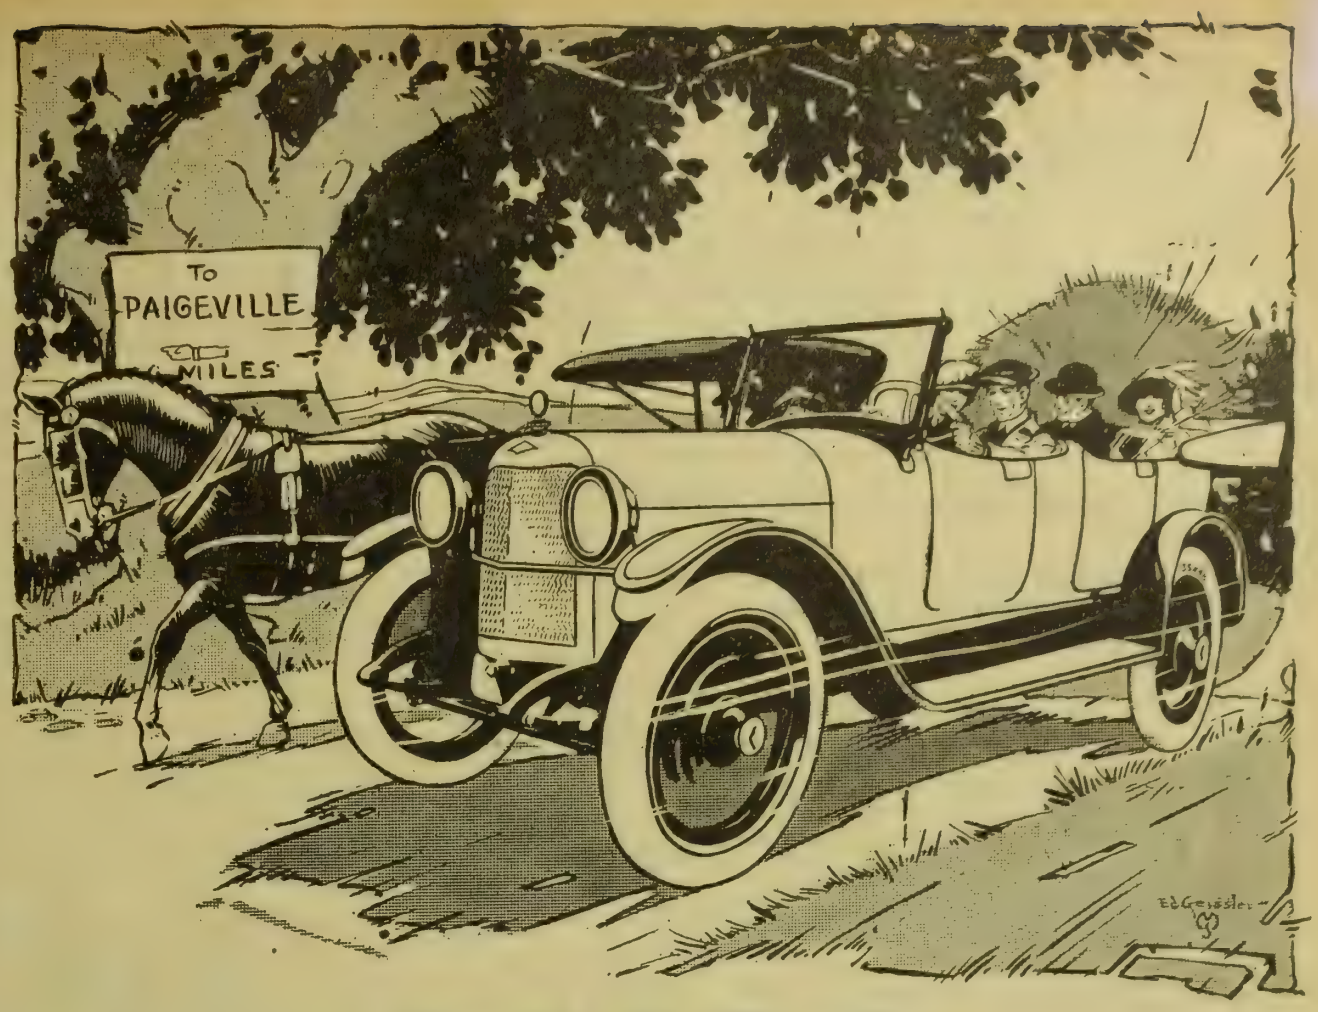
Ripe oranges may be obtained in Bahia every month in the year, but the two principal crops mature in June-July and December-January. On an average each tree produces about 250 oranges. Where the trees receive good care the yield probably will compare favorably with that in California.

Brazilian and California Oranges Compared

The navel orange as it occurs near Bahia is large, varying from three and a half to four inches in diameter, is yellow green in color and extremely juicy and sweet. Comparative studies made by the department of agriculture show that the Brazilian fruits have a considerably lower percentage of peel than the California fruits and somewhat less fibrous matter or "rag." The California orange, however, has a much larger percentage of both citric acid and sugar.

Bud wood from a number of the most promising strains of the Bahia navel orange trees was brought to the United States by the department's plant explorers and is being tested in California and Florida. It is pointed out by the department that because of the important effect of climate on the size and character of the fruit, it is impossible to determine in advance whether strains which appear desirable in Bahia will retain their characteristics in the United States. This can only be decided by the tests now under way.

Denair farmers are busy checking land preparatory to sowing alfalfa.



PAIGE

The Most Beautiful Car in America

PAIGE cars are made in two sizes. There is a seven-passenger, 51-horsepower model which sells for $1495. There is also a five-passenger, 39-horsepower model which sells for $1175.

The "Stratford" model is, of course, considerably larger than the "Linwood." It is well worth the difference in price. But we want to point out at this time that both cars are *Paiges*—blood brothers of the same strain.

So far as a choice between these two motor cars is concerned, it is simply a matter of your individual requirements. If you can advantageously use a large, sumptuous, seven-passenger automobile, by all means invest your money in a Paige "Stratford-51."

On the other hand, if a five-passenger model is ample for your purposes, then, decide on the "Linwood-39."

It is merely a choice between a one karat or a two karat diamond. Both cars are clean cut, flawless gems. In their respective price fields, these two cars represent the *utmost* that you can secure in automobile value.

We are putting the matter before you in this frank way, because we want to be genuinely helpful. We also want to emphasize—just as clearly as we possibly can—that Paige builds only *good* cars—quality cars.

But—above all—make it a point to see the Paige line before you buy *any* car. As a business man, you can't afford to overlook the two greatest dollar-for-dollar values in the entire automobile field. This is a broad, sweeping statement, but you can establish the facts to your entire satisfaction.

Will you make it a special point to see "The Most Beautiful Car in America?"

Stratford "Six-51" 7-passenger	$1495 f. o. b. Detroit
Linwood "Six-39" 5-passenger	$1175 f. o. b. Detroit

Planting Season

Written for California Cultivator

PROBABLY there has been more planting of deciduous fruit trees this season than for some years. Nurseries are already reporting shortages of peaches. We understand, however, there are plenty of freestone varieties but very few of the clings left. Nectarines, neglected for a long time, might well be planted. There is a certain demand for fine, good-sized nectarines, but where there is indication of light planting—which is to be regretted—is in the apricot. True, there have been seasons when this fruit has not proven exceptionally profitable. There have been other seasons which have kept averages up. We may well plant heavily to apricots. Almonds have been planted very freely, but as this nut is imported to this country in immense quantities, sections which are fitted for almond culture may well extend their planting.

Perhaps the lightest planting this season is of olives. The last two or three years have been rather discouraging for the orchardists. We had hoped cooperative organizations would put the market end of the industry on its feet, so encouraging it that thousands of acres might be planted. The movement has not yet succeeded, neither has it been given up, and we believe ultimately there will be a strong olive producers association. Then one of the most healthful of foods, which will increase California's reputation and California's wealth, will be produced more extensively. A large olive grower told us some months ago that if he were planting an orchard today he would plant—if he could get the trees—25 per cent Manzanillos, 25 per cent Ascolanos or Sevillanos, and 50 per cent Missions. The Manzanillos are early ripeners; they are out of the way before any danger of frost, and they extend the harvesting season so as to enable handling the crop with less regular help. The Ascolano is not so fine in quality as the Mission, but its immense size fills a certain demand; the packers must have them in order to fill orders. The Mission, of course, for high quality is the standard, though some prefer the flavor of the Manzanillo. However, the percentage given makes an orchard of a type which gives fruit easy to dispose of to the large packers.

Walnut trees have been selling well this year; prices have been good, and in the sections fitted for walnut planting available trees have been largely picked up. Another neglected nut is the pecan. California is producing some of the finest pecans the markets have seen; they are especially valuable as a border tree.

Pomegranates are a valuable fruit, and while extended planting might prove embarrassing, this fruit might be grown to a far greater extent than

Stone Bridge Near Calistoga

or three years have been rather discouraging for the orchardists. We had hoped co-operative organizations would put the market end of the industry on its feet, so encouraging it that thousands of acres might be planted. The movement has not yet succeeded, neither has it been given up, and we believe ultimately there will be a strong olive producers association. Then one of the most healthful of foods, which will increase California's reputation and California's wealth, will be produced more extensively. A large olive grower told us some months ago that if he were planting an orchard today he would plant—if he could get the trees—25 per cent Manzanillos, 25 per cent Ascolanos or Sevillanos, and 50 per cent Missions. The Manzanillos are early ripeners; they are out of the way be-

The Best Fig to Plant

Written for California Cultivator By G. P. Rixford

IN your answer to a Fresno subscriber in the Cultivator of February 3, I am somewhat surprised that you even guardedly suggested the planting of Adriatic or other variety of fig instead of Smyrna on account of the man not being able to master the intricacies of caprification. I have faith enough in the intelligence of the average California fruit grower to believe that he can master the subject equally as well as does the ignorant Arab of Asia Minor. It is true that there seemed to be some difference of opinion at the Fresno meeting as to the comparative merits of the Smyrna, Adriatic and Kadota as money makers, but none as to the quality of the dried product of the different varieties. The Kadota is out of the question as a dried fig; the skin is too tough. But for shipping undried to the Eastern market it seems to have no rival, according to the interesting paper by Mr. Clark of Sultana.

On a recent visit to a prominent

retail fruit and nut shop in Washington, D. C., the only California figs found on sale were the sour Adriatic, sour from sulphurous acids the result of sulphur bleaching. On showing the proprietor a package of fine Fresno County Smyrna figs he said: "I retail four tons per annum of this Adriatic trash, but if I could get such figs as you show me I could retail ten tons." He added, "I can sell a customer almost anything once, but if he buys these sour Adriatics he never comes for more."

To put it mildly, I was ashamed that such stuff was being sold as California figs. It is time for the packers to realize that they are doing California irreparable injury. They might as well try to build up the fresh fruit trade by shipping frozen oranges and green grapes as to try to build up a great dried fig trade by shipping the unpalatable Adriatic stuff. The importation of the millions of pounds of Smyrna figs can never be stopped except by sending to the Eastern markets the best Smyrnas. However, the growers appreciate the situation. According to statements made at the Fresno convention Fresno County alone is this season planting more than 5000 acres, almost entirely

Bunch of Napa County Grapes

Smyrnas. I hope to see the day when the million dollars per year now paid to the Turk and Arab will be paid to the American fruit grower.

* * *

Mr. Rixford has studied the fig industry from all angles, and we are glad to have his comment and his appreciation of the worth of the Calimyrna or Smyrna fig. It is a very large fig for which there will be a long commercial demand, and the Cultivator would not—and we think did not—in any way discourage its planting. The shipping of frozen or green oranges and of green grapes is doubtless a reflection on other fruits of the same kind which are of highest quality, but we fear the practice will be continued for many years, and yet the orange industry and the grape industry will thrive because of the great number of producers of high quality fruits. The same is true of the fig, but we still believe that there is field for the growing of fine Adriatics—and the way will be devised to cure them right—and to limitedly market the Kadota and even the black Mission. In fact, when it comes to quality there do be some folks who think the black is about the finest thing in fresh fruits. We sincerely hope that the Cultivator may not be understood as in the slightest discouraging the planting of the Smyrna, but there are so many people entering the fruit and every other productive industry who do not understand their requirements that a warning as to their own limitations is sometimes wise. In proof of this we may mention that the writer has a neighbor who has planted one Smyrna tree in the back yard for fruit for home use. Presumably he has no idea as to caprification problems. This is an extreme case but some small growers are planting with little more understanding of this finest of all figs.

Fig growers of Stanislaus County met in Ceres February 6 to organize a Stanislaus County Fig Growers' Association.

Table grape growers of Kerman are planning to form a local exchange.

Send Peaches to Your Friends

Written for California Cultivator

SALES Manager Sturtevant of the California Peach Growers' Association is inaugurating an unique movement in disposing of cured peeled peaches. He has written to each one of the 6000 growers who are members of the organization the letter which appears below. It seems to us that this is a good movement and will result in good advertising for good peaches.

"Dear Growers: This company needs your assistance and cooperation in its sales activities. It wishes to introduce the sale of Ribbon Brand Peeled Peaches in the carton form. The process for peeling dried peaches is owned by the growers company. The carton keeps the fruit in a sanitary condition and bears the "Ribbon Brand". The sale of these will result in greater profit to the growers and will impress their brand upon the consumer.

"Each of you has many friends scattered over the United States to whom you would like to send some peaches, especially so when by so doing you are assisting your own company to introduce its brand. If you will, therefore, fill out and return to us the enclosed card with the names and addresses of such persons thereon, we will forward and prepay express charges to each address our attractive five-pound carton of peeled peaches, charging against your account with us $1.00 for each package sent forward. You are thus enabled to pay for the gift from your final settlement with us later in the year.

"Most of your Eastern friends would enjoy a day or two of California sunshine, and a package of peaches direct from your orchard would make a great hit. We will mark the package, 'Compliments of.....'

"Yours for increased consumption of "Ribbon Brand" Peaches. California Peach Growers, Inc., A. J. Sturtevant, Jr., Sales Manager."

Hanford reports very encouraging numbers signing up for the Peach Growers' Association.

SPRAY NOW

Written for California Cultivator

For the grower who had curly leaf on his peaches, who had branches break off because of the peach worm, or wormy peaches, this is the time to spray with lime-sulphur solution. If the commercial is used, full strength, that is, one gallon to nine or ten.

Citrus growers are, some of them, spraying with commercial lime-sulphur, say, one to 30 or 40—this in the hope of catching possibly now and then a black scale—or giving a preliminary spraying for red spider which will appear later. Remember that when red spider shows plainly that he is occupying the orchard it is too late to accomplish much for the particular trees infested.

Another caution at this period of the year: Watch for aphis. Aphis, like the red spider, needs to be killed before it is born. The melon grower or grower of any other succulent crop should watch his vines closely, and the first that shows aphis should be destroyed by burning where it stands. Cover with distillate and burn at once. Keep down weeds which may harbor the pest. One treatment in time will save 9,000,000 or more.

JOHN DEERE IMPLEMENTS

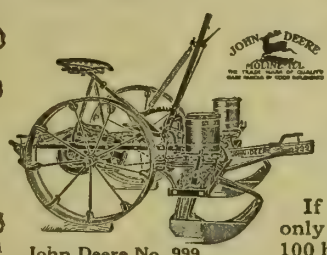
BOOK FREE 156 page reference book—tells all about a complete line of farm implements and how to adjust and use many of them. A practical encyclopedia of farm implements. Worth dollars.

Describes and illustrates Plows for Tractors; Walking and Riding Plows; Disc Plows; Cultivators; Spring Tooth and Spike Tooth Harrows; Disc Harrows; Alfalfa and Beet Tools; Farm and Mountain Wagons; Manure Spreaders; Inside Cup and Portable Grain Elevators; Corn Shellers; Hay Loaders; Stackers; Rakes; Mowers and Side Delivery Rakes; Hay Presses; Kaffir Headers; Grain Drills; Seeders; Grain and Corn Binders.

This book will be sent free to everyone stating what implements he is interested in and asking for Package No. X-111.

JOHN DEERE, MOLINE, ILL.

John Deere Corn Planters



John Deere No. 999 is accurate. It has the John Deere *Natural Cell Fill, Edge Delivery Seed Plate.* Surface of hopper bottom and openings to seed cells are oblique, or sloping. Kernels move toward and enter the cells in their natural position. They do not have to be tipped on edge.

Merely move foot lever to change number of kernels per hill.

Drilling distances varied, and change hilling to drilling or back to hilling made easily.

Accuracy in a corn planter means uniform drop—number of kernels the same in each and every hill.

If the planter misses only six kernels in every 100 hills, the loss in yield is nearly two bushels per acre.

Accuracy in planting has been the main object in designing John Deere planters. One of the many advantages of using a John Deere planter is that with proper handling it will plant practically 2, 3 or 4 kernels in every hill, as desired.

John Deere Spreader

The Spreader with the Beater on the Axle

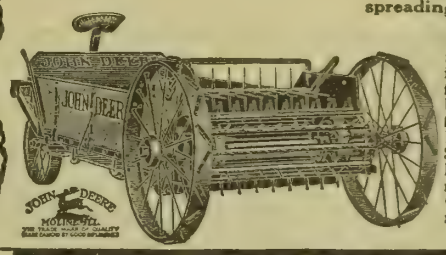
Mounting the beater on the axle simplified the construction, eliminated troublesome parts and made possible a successful low-down spreader with big drive wheels. There are no shafts to get out of line, no chains to cause trouble, and no clutches to adjust. The only spreader with beater and beater drive mounted on axle.

Low down, with big drive wheels out of the way. Easy to load.

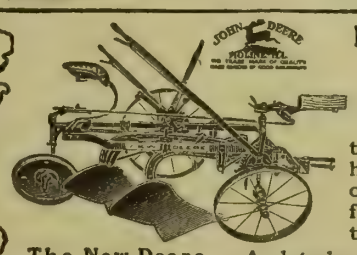
Revolving rake, driven by manure moving toward the beater—no bunching of manure. Ball bearing eccentric apron-drive—a new and exclusive driving device.

Makes uniform spreading certain.

Wide spread attachment for spreading seven feet wide can be furnished for the John Deere Spreader. No chains nor gears. Quickly removed.



New Deere Light Draft Gang Plow



The New Deere Gang is the most widely used plow of its type.

It is light draft, durable and is equipped with John Deere bottoms, known all over the world for superior work, easy scouring and light pulling qualities. It cuts and turns full width of furrow.

A simple, practical foot lift and auxiliary hand lift lever—easy to raise bottoms out of the ground.

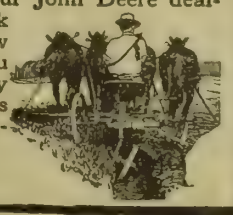
John Deere Quick Detachable Shares—great labor and time savers. Share can be taken off easily, only one nut to remove.

For twenty years the New Deere Gang has had the good opinion of enough farmers to make it the one best seller—

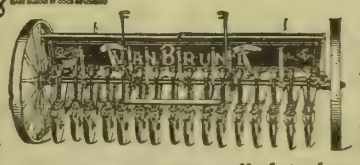
And, today, it is the same plow it was twenty years ago, with the usual minor refinements added.

Correct in design, always representing the highest development of the plow-maker's art, the New Deere Gang is a leader, and has been every single year for twenty years.

Go to your John Deere dealer's and look this plow over—you will readily see why it is such a popular plow.



Van Brunt Grain Drills



Van Brunt Drills plant any small seed.

Amount sown per acre easily regulated.

Direct, double, gear drive from the continuous axle.

High-grade discs with bearings guaranteed to last lifetime of drill. Scrapers keep discs clean.

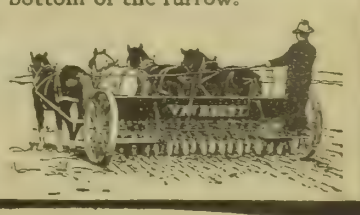
Pressure springs individually adjustable to make uniform depth furrows.

Either single or double discs.

Grass seeder attachment which will drill or sow broadcast can be furnished.

Van Brunt Grain Drills are particularly noted for their adjustable gate force feed. Each feed cup plants exactly the same amount. The seed is compelled to leave the seed box in even, continuous streams without bunching or choking up. All the ground is seeded.

The Van Brunt Single Disc is the first successful single disc grain drill with closed delivery. The seed is protected by metal seed tubes, disc openers and the disc boots until it reaches the bottom of the furrow.



JOHN DEERE, MOLINE, ILLINOIS

The men who sold you your fruit trees say:

"Your trees must be planted *right* if they are to thrive. Make the holes deep and wide and break up the subsoil. The best way to do this is by blasting."

Nearly every Western nurseryman uses and recommends blasting for tree-planting. "We know the value of such work," say Fancher Creek Nurseries, California. "We favor blasting," says Oregon Nursery Co. "Blasting is important," says Puyallup Nursery, Washington.

Blast with

GIANT FARM POWDERS
STUMPING — AGRICULTURAL

—which do their work cheaper and *better* than ordinary dynamites. These improved explosives—made in two brands, Eureka Stumping Powder and Giant Stumping Powder—are prepared especially for Pacific Coast *farm and orchard* work. They pulverize the soil several feet deep and wide, and place it in the best condition to insure the rapid growth of trees and crops.

Be careful to get the genuine, made by the company which originated all "giant powders." If your dealer has only ordinary dynamites, write us and we will see that you are supplied with the *real* Giant Powders.

Get Some of These Five Free Farm Books

Get our valuable, illustrated books. They tell how to save money by using Giant Powders for Boulder Blasting, Stump Blasting and Ditching, how to grow bigger farm crops by blasting the subsoil and how to blast in new or old orchards. Mark in coupon the subjects that interest you, and the books will be sent free.

Study Parentage of the Scion

Scions must be cut from trees that show good parentage. Never cut a scion from an unproductive or sickly-looking tree, for like will produce like. Healthy scions of good quality, hardy, and sound should be sought. They may be taken from two sources—from an old tree or from young seedling stock in the nursery row.

When taken from old trees, straight, thrifty looking twigs of the previous year's growth should be chosen. A terminal bud on each scion is desirable, but this is not absolutely necessary. Each scion should have at least three buds. Six inches is usually considered a good length to cut them.

Scions obtained from the seedling stock in the nursery rows are preferred by some. The shoots from this stock are usually in a better condition than shoots from older trees. The chief objection to using scions from this source is that one never knows what he is grafting, as the young trees never have borne fruit.

The scions may be selected in the autumn, during the winter, or early in the spring. When cut in autumn or during the winter, they should be packed in fine sand or sawdust, placed in the cellar, and kept damp. If cut in the spring, and are not used immediately, they may be kept by burying the lower ends about four inches in the ground in some shaded spot. Never allow them to suffer exposure.—Kansas Industrialist.

California Prune and Apricot Growers Name Trustees

Returns from the final election of trustees for the Prune and Apricot Growers' selling association show the following men elected:

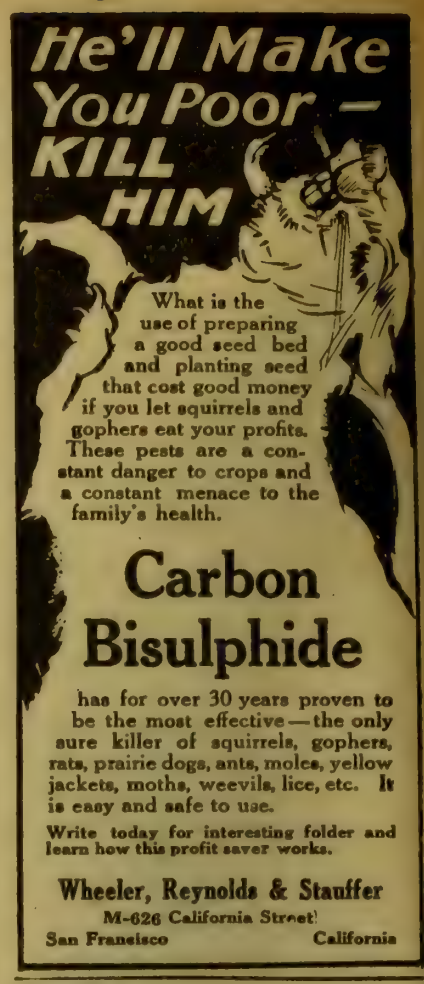
HORTICULTURAL ACTIVITY IN SAN LUIS OBISPO

County Horticultural Commissioner S. V. Christierson of San Luis Obispo County writes as to the horticultural awakening of San Luis. He says.

"At the present time some 10,165 acres are planted to fruit trees of different varieties, of which 2400 acres are now in bearing. About 3000 acres are planted to almonds, and this season 2000 acres will be planted in the Paso Robles and Templeton sections. The estimate made by this office two months ago indicated that 2000 acres would be planted to fruit trees in this county during the spring of 1917. By February 1st enough trees had been shipped in to plant 3500 acres, so that actual plantings will probably exceed estimate by 100 per cent."



What is the use of preparing a good seed bed and planting seed that cost good money if you let squirrels and gophers eat your profits. These pests are a constant danger to crops and a constant menace to the family's health.

Carbon Bisulphide

has for over 30 years proven to be the most effective—the only sure killer of squirrels, gophers, rats, prairie dogs, ants, moles, yellow jackets, moths, weevils, lice, etc. It is easy and safe to use.

Questions and Answers

ANSWERS BY EDITOR AND STAFF

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Workmen's Compensation

An inquirer wishes to know as to the present situation in the California workmen's compensation law and as to whether it applies to the farmers. This matter was fully discussed by Mr. Farrand in a former Cultivator, but we have asked him as to whether there are any changes which would affect the farmer, and he writes:

"The California workmen's compensation law excludes farmers, among others, from its provisions. A farmer may, however, become subject to its provisions by filing a written acceptance to that effect with the Industrial Accident Commission, San Francisco. In the absence of such election on his part the farmer remains liable to his employees in damages in the case of injury to them occasioned by negligence, etc. An employer may insure himself against the liability created by the compensation law, either with the state fund or with a private insurance carrier. Information concerning the state fund may be acquired by addressing State Fund, Underwood Building, San Francisco, or State Fund, Union League Building, Los Angeles. Private insurance companies will likewise furnish information, rates, etc., to persons desiring the same."

Distributing Manure

A subscriber in Portugal recently wrote the Cultivator for information as to the advisability of spreading manure in his olive orchard. He is not far from the city of Lisbon and has practically a daily supply throughout the year. He has been applying the manure daily direct to the orchard during this season of the year—which in Portugal as in California is the rainy season. He wishes to know regarding the handling of the manure during the three or four months when there is no rainfall. In Portugal this period begins in May. He states that he has no water under pressure to aid in composting. We have written him that regardless of the dry season we would spread the manure as rapidly as available rather than take a chance of its fire-fanging or burning out the nitrogen; also during the summer months we would cultivate lightly. However, we referred the question to Prof. C. B. Lipman, University of California, and he replies:

"You can safely reply to your inquirer that the best thing he can do under the circumstances is to haul the manure out to the fields as fast as it is made and leave it there. While there is no question that he will lose some of the beneficial properties of the manure through oxidation, he will gain so much more by protecting his soil by means of that barnyard manure, even though it is not plowed under, that the loss in comparison will be very small and insignificant.

"He would benefit greatly, I think, by ceasing cultivation in his orchard, as I have been recommending for the past four or five years, and merely use his barnyard manure as a surface mulch for the soil, not plowing the material under at all. If, on the other hand, he has bare land on which grain or vegetables are grown then of course the best way for him to do would be to apply the manure and immediately plow it under. But even letting it lie out, if plowing is impossible on such land as is last mentioned, would be of very great service to the soil."

Setting Prunes

Please advise how to prune roots of prune trees and plant, also how much of tops should be cut away.—Subscriber, Marysville.

At one time severe root pruning became almost a craze. H. M. Stringfellow, a Texas horticulturist, published "The New Horticulture" in which he announced discovery of or advocated advantage of close root pruning. In fact the root system was almost entirely sacrificed and a tree closely resembling a cutting was planted. The system is now generally discredited, but one lesson remains, and that is that clean cuts of the larger root tips, which are almost invariably more or less mutilated as taken up from the nursery, are advantageous. Mangled roots afford lodging for fungus and fungus sometimes means root rot. However, we would do no more cutting than necessary to remove any mangled portions of the root. This especially is true of the tap root. As to cutting back the top, that is different. The wood which comes from the nursery is only of value as a base or foundation for the future tree. Too often the entire top or too much of it is left when planted in orchard form. We would cut back all tops to a uniform height, say 16 to 20 inches from ground.

Effect of Feed on Milk

Please advise whether feeding cows any particular feed will cause them to give richer milk or influence the milk test.—Subscriber, Coronado.

Feeders have found little or no influence on the fat content of milk by feeds, that is, in the percentage of fat.

1842 The Seventy-Fifth Anniversary of 1917

P&O

LIGHT DRAFT PLOWS

Built for the Field Test.

Three-Quarters of a Century of "Knowing How" Hammered Into Every One of Them.

The product of the Parlin & Orendorff Co. has always been noted for simplicity of construction, great strength and ease of operation. It was upon such a basis that the founders of this business made their implements, established their reputation, and built their factory. It is upon the same foundation that the business has been carried on to this day, and in 1917 we celebrate our Diamond Jubilee; 75 years of practical experience gained through constantly striving to provide for the exacting requirements of three generations of American farmers.

For an even three-quarters of a century we have met the demand, and today we operate the largest and oldest permanently established plow factory in the whole world. "It's the way we build them."

P&O

Light Draft Plows, Harrows, Planters and Cultivators are made in all types and sizes, to meet the conditions in all sections, and are Backed by an Unqualified Guarantee.

We also make the most complete line of Traction Engine Plows produced, and we have a special catalog devoted to these famous plows.

The P&O Little Genius Engine Gang Plow

was the most popular plow shown at all points on the 1916 National Tractor Demonstration.

We will send P & O Catalogs to any address. While P & O Implements are sold only through established implement dealers, we welcome correspondence from farmers in all sections.

TALKS ON

Nitrogenous Fertilization

Number 9

YOU have often asked yourself how much good comes from the nitrogenous fertilizer you use. That depends largely upon the ability of your soils to hold and convert it into nitrate nitrogen.

SULPHATE OF AMMONIA

is held in the soil by humus compounds until the beneficial bacteria have transformed the ammonia into available plant food.

Partly because of the small quantities ordinarily applied as compared to the large mass of earth it fertilizes, Sulphate of Ammonia is readily nitrified even in soils poorly supplied with humus.

Dr. Lipman of the Berkeley Experiment Station states, in Bulletin 260, that "definite nitrification of Sulphate of Ammonia nitrogen, occurred in all soils tested without apparent exception." Further on he notes that Sulphate of Ammonia is particularly adapted for use on arid soils because of the apparent ease with which it is nitrified in them.

This means that conditions existing in California soils are exceptionally favorable to the use of Sulphate of Ammonia. Its action should be noticeable within from nine to fourteen days.

FRESNO NURSERY COMPANY
P. O. Box 615 - - Fresno, California

When writing advertisers, mention The Cultivator.

The fat is increased by rich and abundant feeds of course by increase in the flow of milk, but a cow which naturally produces four per cent milk will continue to produce four per cent milk under richer feed though she will possibly double the quantity. The test of cow's milk varies somewhat from day to day and during the milking period. In general near the close of the milking period there is a higher per cent of fat than at time of freshening. The greatest variation we have ever known was that of a Jersey cow being fed to the limit. Naturally she gave about five per cent milk. While she was still apparently in normal condition a test showed her milk to contain nearly 11 per cent of fat. The tester felt sure there was some mistake and made a re-test, which showed the same percentage. It was afterwards learned that the cow had an exceedingly high temperature and within 24 hours died.

Persimmons

In answer to request in Cultivator of January 27 for ways of using persimmons besides eating them fresh several suggestions have been received.

Mrs. Geo. Campbell of Whittier sends recipe for a persimmon pudding, which appears on household page.

L. J. Harbison of Vacaville writes: "Advise subscriber that if he will write to United States Department of Agriculture, Washington, D. C., for 'Farmers Bulletin 685, the Native Persimmon', he will learn how to make persimmon bread, crumpets, griddle-cakes, peanut muffins, cake, pudding leather, ice cream, fruit ice, taffy, fudge, preserved persimmon pulp, preserved whole persimmons, coffee fruit cake."

James W. Wood of Alameda sends clipping from catalog of Fancher Creek Nursery on Japanese methods of curing persimmons and a simple way of drying:

"The astringency is readily removed by placing the fruit in Japanese tubs, from which Saki (Rice-beer) has been recently withdrawn. After the persimmons are placed in the tub, close carefully to exclude the air. In ten days the fruit, although perfectly firm, will have lost all its bitterness.

"A new simple process of alcohol inoculation is lately practiced. Pierce the fruit at the bottom several times with a common needle dipped in alcohol and pack them in a tight box or container lined with straw and layers between the rows, keep the box closed for ten days.

"It is not generally known that the persimmon is delicious when dried. It is so sweet, so rich in sugar and has such a unique flavor that one who has never eaten the dried persimmon before, immediately comes to the conclusion that the fruits have been crystallized. The method of drying is simple; skin is pared off and the fruits are suspended by the stems on a stick and exposed to the sun when they gradually lose their original form—turning quite dark and covered with sugar crystals. The dried persimmon is considered by many to be more delicious than the 'date of commerce'. Fruit should be picked for drying when yellow and firm."

Thompson Seedless

We have ten acres near Lindsay and would like to know if Thompson Seedless would do well there. The soil is rather heavy with very little sand. What special care does the Thompson Seedless require, especially as to pruning? Can it be pruned back short or will it have to be trellised and will it need irrigation after the first year? When should it be planted?—Subscriber, Glendora.

NORWALK

IRRIGATION Preparedness

Wouldn't it be a rather good plan after a prosperous year to replace your old uneconomical plant with a newer and better one? Let us furnish it.

Or perhaps all your engine or pump needs is a good overhauling. Let us do that and we will do it right too.

SMITH-BOOTH-USHER CO.

Irrigation Machinery and Supplies
Los Angeles -:- California

Motorcycle Given Away

If you would like to own a fine speedy $290 Indian motorcycle as a reward for work that can be done during spare time send in your name to California Cultivator, Los Angeles, to take part in the campaign just starting. This is the easiest way to get a motorcycle. Already eleven machines have been won with far less dollars in subscriptions secured from others than the motorcycle would have cost of a dealer. Write and say "Tell me about the motorcycle you will give away" with name and address and we will tell you all about it. This places you under no obligation to us whatever. Address Manager Motorcycle Campaign, California Cultivator, 115 N. Broadway, Los Angeles.

Thompson Seedless would without question do well in the section you mention. We question very much whether you can purchase any vines this year for planting has been very heavy. Some have recommended that in view of the heavy planting other varieties will perhaps be safer. Of course Thompson Seedless has double marketing value in this, that it may be shipped as a table grape or cured as a raisin, but the popular demand is for a raisin of the Muscat type, and there might be overproduction of Thompson Seedless. The pruning required by the Thompson Seedless is the so-called long pruning. The vines are usually trellised on wire, though some prefer staking.

Almonds in Tulare

Would almonds do well in the Lindsay section or do they require lower wet land?—Subscriber, Glendora.

So far as soil is concerned any section where peaches do well will answer for the almond, and they do not want wet land. However, the growing of the almond is more a matter of climate; it must be grown in a section where there are no late frosts.

Greasewood

What is the name of the shrub from which the branch enclosed was taken? It grows in an exceedingly dry part of San Joaquin Valley.—Subscriber, Kern County.

Dr. A. Davidson writes: "This is 'Mexican Grease Wood,' Larrea tridentata, a desert shrub sometimes used as a tea for blood troubles.

Spraying Apples

I have a few apple trees, the fruit of which falls every year before it is ripe, and it is very wormy.—Subscriber, Burbank.

Spraying for codling moth or "wormy" apples will be touched upon in some number of the Cultivator in March. Spraying of the apple at this time would only be effective against scale or fungous trouble.

Dead Stubs

I have apple trees which were grafted a few years ago and they did not heal over properly. There is decay on the old stubs. Is it practical to treat them by cutting out dead wood, disinfecting or filling with cement?—Subscriber, Burbank.

Had the grafts been properly inserted in these trees the healing over would have been done quickly and the stub not had time to decay. Now, however, the best way would probably be to chisel out so far as possible the dead and decaying wood and treat with coal tar or grafting wax. It might be advisable first to paint the diseased wood over with Bordeaux, which is a disinfectant.

EGG LAYING CONTEST

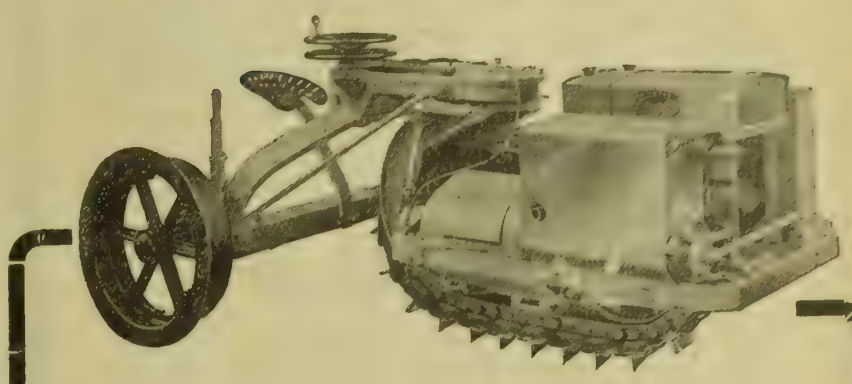
The first week of the egg laying contest at the Phoenix, Arizona, Union High School was a Leghorn week. The highest record made by any pen was made by White Leghorns with 21 eggs. One pen of Brown Leghorns, and one pen of White Leghorns laid 20 eggs each. The highest individual record was made by a R. I. White pullet which laid six eggs in the seven days. The two Hoganized pens, one "good" and one "bad" produced 20 eggs for the good and one small egg for the bad.

NATIONAL SWINE SHOW

The National Swine Show will be held at Omaha October 3-10.

The arrangements for the show are similar to those of 1916 show. The same buildings will house it in 1917 as were used in 1916, with such additional room as is necessary to properly care for the exhibits. Extra showring facilities will be provided.

Does the Work of Six Horses



—and saves you money!

BEAN TrackPULL SIX HORSE Tractor

Find out about this wonderful little tractor now,—before you start another season's work. The BEAN TrackPULL Six-Horse Tractor weighs only 2800 pounds—so light that it does not pack the softest soil. It will pull any load six horses can pull all day long and costs no more to keep and work than TWO horses. And the BEAN TrackPULL Tractor will work 24 hours a day if you say so. Here is powerful traction for every use at a low cost. The price is $975—little more than you spend to keep six horses for a year. There is no other track-laying orchard tractor made for less than $1800. Now see what it will do for you.

Orchard Work

In an orchard or citrus grove this tractor will work under tree boughs only four feet off the ground, and closer to the trees than horses can go. It is especially adapted for cultivating and works hour after hour without a stop. A boy can operate it with a little practice. The BEAN TrackPULL Tractor "gee's" and "haws" just like a team of horses, and delivers as much power on the turn as when pulling straight.

The 10-Foot Turn

This wonderful little tractor is so compact that it will turn completely around in a circle 10 feet across. Because it can make such a short turn it gets into corners just as well or better than a team can. The motor is a simple four-cylinder automobile type, but built for heavy duty. Controlled by a friction clutch driving four big gears. It has a pulley for stationary work. The grousers and wheel flanges can be removed for running on boulevards.

No Other Tractor Like This

No other tractor now does or ever did what the BEAN TrackPULL Tractor does. No other tractor with such advantages was ever sold at such a low price. It is fully patented. There will be no other tractor like it. The demand for these tractors is growing daily. Wide-awake farmers and growers are realizing the value of the BEAN TrackPULL Tractor—

We Guarantee Prompt Deliveries in April

Our factory has been working night and day but we cannot supply the demand. We are now enlarging our plant and increasing our facilities, and by April will be able to handle deliveries promptly.

If you are interested, don't delay.

"The Old Lines"

EVERYBODY speaks of them as "the old lines," many perhaps without realizing how thoroughly new and up to date are all these **Champion, Deering, McCormick, Milwaukee, Osborne** and **Plano** mowers, rakes and tedders. What really good improvement was ever made in haying machines that did not show itself first on one of these machines? Where can you find mowers, rakes, or tedders that need so little adjustment, so few repairs, or that are so easy to repair when they do need it? Nowhere. These old standard machines, known to farmers for three quarters of a century, can still be depended upon to get in all the hay from any field and to make the work light for the farmer.

When you need a mower, rake, or tedder, see the local dealers who handle the **International Harvester** lines. We can remind you here that our machines have always done good work, but the dealer can show you why they still do it. You will find that the local dealer has just the size and style you need. Buy from him.

Once Over!

Two diskings in one with a double-action harrow!

Cutaway (CLARK)

Disk Harrows and Plows

Save half the time and labor and have a better seedbed. Use a CUTAWAY (CLARK) Double Action Harrow. Its rigid main frame causes the rear disks to cut and turn all the land left by the fore disks—and with equal force. It will

Quickly Cut, Pulverize and Level

the toughest plowed land. The CUTAWAY disks are of cutlery steel *forged sharp*—and they penetrate deep without bringing up stones and trash. Dustproof, oil-soaked, hardwood bearings and perfect balance make light draft. Tongue truck not required—close hitch. Many CUTAWAY (CLARK) Harrows in use 25 years and still giving splendid service. There's a CUTAWAY for every need and a size for every requirement. If your dealer has not the *genuine* CUTAWAY, write us direct. Be sure to send for our new free book, "The Soil and Its Tillage." Plan now for better crops.

Races and Strains of Bees

Written for California Cultivator By Henry Perkins

MEMBERS of the honey bee family are found in their native state in practically all parts of the tropical and temperate zones. There are many species ranging from the giant bee of Ceylon to the Central American species, which is no larger than an ordinary house fly. Only a few species have proved profitable to man when domesticated. The leading races kept on the North American continent are the Italian, black or German, Carniolan and Banat. The Italian leads all the others in popularity with the beekeepers. The Italian bee combines the greatest number of virtues and fewest vices, and in a general way is more adapted to our climatic conditions. They are above all industrious and their queens are wonderfully prolific. Their tendency toward swarming may, by proper handling be reduced to a minimum. They are among the gentlest of all races and are therefore easy to handle. It also appears that the Italian is more resistant to disease, especially to European foul brood, than the other races.

Next in importance come the black or German bees. They are much given to swarming and are often extremely cross, especially when kept in large apiaries. They are good honey gatherers, beautiful comb builders and hardy winter bees. The Carniolan bees seem to embody all the virtues of beedom save one. They are excessive swarmers and therefore not as good for the average apiarist as the Italian.

The Banat are of comparatively recent introduction. They are very gentle and steadily gaining favor where they have been tried.

Aside from the racial difference in bees there remains a considerable range of variation among the various strains of a given race. For instance among Italians we have the golden, leather colored, etc. Breeders have spent years endeavoring by selection and inbreeding to establish some special characteristic, as for instance, nonswarming, gentleness, white capping, etc. The fact that queens always mate at large and never in confinement makes selective breeding extremely difficult. No doubt some progress has been made in this direction, but it is also equally apparent that many of the claims made by enthusiastic breeders are extravagant. The natural tendency of bees to cross mate and hybridize works against the breeder who is specializing. Attempts have been made to overcome such obstacles by selecting an island for a breeding ground. Sooner or later the art of bee breeding will be systematized. Summing up the subject I will say in conclusion that the Italian bred from imported stock is a safe selection for the California beekeeper to bank on.

Honey Strainer of Cheese Cloth

There are probably more cheesecloth strainers used in straining honey than any other style, says a writer in the Beekeepers' Guide. The arranging of this style of strainer in a satisfactory manner over the top of a clarifying tank is not so easily accomplished. The orthodox way of tying it on top of the tank with a stout cord is not very satisfactory, for who hasn't had such a strainer work well until the very minute he is ready to draw off a tank of nice, clear, transparent honey, when behold, in goes the strainer, skimmings and all.

We are sure you'll appreciate what I'm telling you for you have likely all had just such an experience. A cloth strainer tacked to a frame is not much better, for it will tear loose, is hard to wash and is generally unsatisfactory.

How to make a satisfactory honey strainer of cheesecloth, one that is easily kept clean, is as follows: We will describe a strainer that fits a tank 26 inches in diameter. Cut four pieces of narrow lumber 26 inches long. The material we use is ⅞ x 2½ inches and lies flat on the tank when in use. These four boards are nailed together into a frame 26 x 26 inches square. If the corners are halved together they look some better. So much for the frame. Buy two yards of cheesecloth, fold it in the center and sew the two selvedge edges together, making a bag. Then put the frame inside the bag and place on the tank. The open end is folded under the strainer frame, between that and the tank. It will be noticed that there are no strings or tacks, that the strainer is easily taken off to wash, and has thus far proved very useful to us. This is the second season we have used it.

Growing Popcorn

There is a very common belief that the supply of popcorn is not nearly equal to the demand. No doubt this belief comes from the fact that popcorn is sold very high—sometimes as high as 5 cents per pound—by retailers. There is a great deal of variation. One season there may be a shortage, and another year a surplus.

For popcorn a rich loam in a high state of cultivation is best. If it is not naturally rich, 20 or 30 loads of rotten stable manure per acre should be applied. We plow the ground deep, harrow thoroughly, see that the seedbed is well compacted before planting. We go over the ground with a harrow just before the seed is put in so that all weeds which have started will be killed.

The rows should be not less than three feet apart. Popcorn being much smaller than field corn can be planted much closer. We plant from one to two kernels every eight inches in the row. Some varieties stool very readily, producing occasionally 12 stalks from a single seed. If this kind is chosen, care must be taken not to plant it too thick. The tendency always is to drop too many seeds in a hill, consequently it is almost always necessary to thin the young plants after they are well started.

Great care is always necessary at the first cultivation, so as not to injure the tender young plants. We give about the same treatment as for field corn, keeping the soil free of weeds, and well pulverized. The land should be well drained, as popcorn will never do well if excessive moisture is present.

FARM VALUES AND RAILROADS

Transportation Problem Must be Solved Nationally in Order to Assure Agricultural Prosperity.

THE greatest industry of the United States is farming. Next to that comes transportation.

Efficient transportation is essential to the continued welfare and business progress of the nation. To the farmer it means wider markets and better prices for his crops.

Speaking for 90% of the railroad mileage of the country we invite your cooperation in the solution of the railroad problem to that end.

Make Regulation Efficient

There is no question that public regulation of transportation has come to stay. The railroads accept it. They ask only that such regulation be made efficient. They ask that the functions properly subject to public supervision—incorporation, the issuance of securities, the making of rates—be placed under the direction of a single responsible national body such as the Interstate Commerce Commission, with regional subcommissions, in order that regulation may be kept close to the people. They ask that such regulation be so administered as to permit the railroads to earn a living return, to attract new capital and to make the improvements and extensions necessary to enable them to serve the American people fairly and efficiently.

In the Federal Reserve and Rural Credit Banking Systems the operation of regional divisions under Federal supervision is well illustrated. The railroads seek a similar solution of their problem.

Commerce is Nation Wide

The farmer wants free trade among the states.

Commerce in farm products is not confined to state lines. It is nation-wide. Its regulation should also be national. The fundamental state right is the right of each state to be protected against discriminations by other states such as exist today. Every barrier that a state erects to the free movement of commerce across its borders limits the farmer's market, makes it easier for speculators to control products and depress prices and tends to increase the cost of what the farmer has to buy.

The railroads cannot serve 49 masters—48 states and the nation—and serve efficiently. The present system of multiple and conflicting regulation is wasteful and destructive.

In the interest of all, regulation should be in behalf of all the states. We invite discussion of this question and shall be glad to answer questions and to supply information on request.

This is the first of several brief talks on this subject.

Pres. B. & O. R. R.

We allow the crop to thoroughly ripen on the stalk, then husk out and store in a dry place, and when thoroughly dried out we store in barrels, so arranged that rats and mice cannot get at it.

If the fall has been very dry, the corn can be used the first season, but as a rule it contains too much moisture and should be held over until the next year. If marketed the same season it will not pop well, and this tends to lessen the demand.

Broom Corn Culture

An advantage possessed by the Southwest for the production of broom corn is that the usually dry, sunny weather of the region during and following harvest is favorable for curing the brush so that it retains its natural green color. While the broom-corn growing industry is largely centered in the Southwest, it is still carried on to a greater or less extent in the Central States.

About two-thirds of the broom corn crop of the country is of the dwarf variety. The fiber of this is usually much finer than that of the standard broom corn and its method of growth facilitates harvesting. The head, or brush, of the dwarf plant, however, is relatively small and is used chiefly for making whisk brooms. The department of agriculture has recently developed a third variety—the Acme—which combines the height and other growing qualities of the dwarf with the size of brush of the standard. This variety is not yet grown commercially.

Growing the Crop

The cultural requirements of broom corn are practically the same as those of milo, kaffir and corn. The time and depth of plowing depend largely upon the nature of the soil and the quantity of the winter rainfall. The land should be worked with a disk harrow and a smoothing harrow into a deep, uniform seed bed, since this permits sowing the seed at a uniform depth and allows the young plants to emerge at about the same time and the brush to develop uniformly.

Harvesting

To obtain brush of the best quality, harvesting should be done early. It may be at any time, from the beginning of blooming until the seed is in the early dough stage. The exact time depends very largely upon the development of the fiber. The strength of the fiber increases until the natural pea-green color extends from the tip to the base and from the outside to the center of the head. After this time the brush becomes more brittle as the ripening progresses. If harvesting takes place before the green color has developed throughout the base of the brush, the result is a weak base and poor quality.

Market for Teparies

One of the best beans yet produced is the desert bean known as Tepary. Many who grew them when they were first introduced found it almost impossible to dispose of them at satisfactory prices. The trade did not understand them, and they would hardly pass for the Small White Navy, but with the present high prices of everything—especially beans—there has been demand for this type of bean, and the Arizona experiment station, which was largely responsible for its introduction, informs us that the New York brokers will now handle the beans in almost any quantity and will buy on samples. Of course carlots are necessary for cross-continent marketing. We also presume that San Francisco and Los Angeles buyers will be more willing to buy the beans than formerly.

This is the Small Tractor You've Been Waiting For

HERE'S a tractor, the Advance-Rumely "8-16" that was especially designed to fit the needs of the small and medium size farm—a small, light weight, kerosene burning outfit to meet the demand where the famous Rumely OilPull is too large.

The "8-16" is easy to handle, economical and durable. It supplies reliable power for every farm job, and just as important, it is made by a company with an established reputation for dependability.

It is a real one-man outfit—tractor and plows are combined in one machine, and full control is from the driver's seat. With the Advance-Rumely you plow the same as with a horse gang, the plows are where you can always see what you're doing. Also you can back up with your plows, make short turns and cut square corners.

Kerosene for Fuel

Kerosene is its fuel, and it burns kerosene, not as a makeshift proposition, but continuously and at variable loads as well as full load.

An Advance-Rumely "8-16" not only will plow, but it will draw your discs, drills, harrows, mowers and binders, and on the belt it will run a small separator, hay baler, silo filler, sheller, feed grinder, etc. In fact, it will deliver the same reliable, steady power on all jobs—draw-bar or belt. When used for other jobs than plowing, the plows are quickly detached.

The powerful four-cylinder motor and the entire machine is Advance-Rumely built throughout. It comes from the same shops that build the well known OilPull tractor, the Ideal separator, and all the other dependable machines in the Advance-Rumely line.

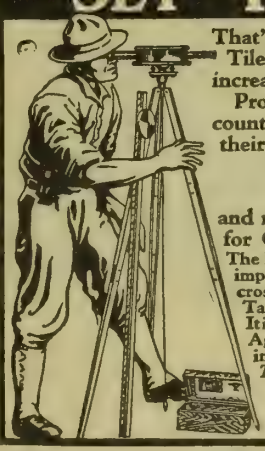
SET YOUR OWN PRICE



That's what every man does who owns *Properly* Irrigated, Ditched, Tile Drained or Terraced Land. And if you don't want to sell, your increased yearly profits are just like turning waste land into cash. Progressive land owners in every State and practically every county in the Union have discovered that the *only* way to bring their land up to the desired state of production is to get a

Bostrom $15 Farm Level

and make spare days the most profitable days. Also fills the bill for Grading, Road Building, Foundation Work, etc.

The Bostrom Farm Level has been on the market over thirty years, the latest improved having a *Telescope* with *Magnifying Lenses* which enable you to see the cross on the Target a quarter of a mile away. Man Size Tripod, Leveling Rod, Target, Plum-Bob and full instructions included. Weight, 15 pounds. It is used and *endorsed* by Agriculture Schools and U. S. Farm Demonstration Agents, and you will endorse it, too, after using it—if not *Your Money Back*, including express both ways. Write today for description of *Level* and *Telescope*, details of our Money Back Guarantee, and names of Jobbers in San Francisco, Sacramento and Los Angeles who carry it in stock.

Worn Out Soils Made Productive

by using

Hauser's Organic Fertilizers

Science and practice both indicate that Nitrogen and Phosphoric Acid are necessary to produce the best results from the Citrus Orchards, and these two essentials are most prominent in organic fertilizer. Hauser's Organic Fertilizer is a concentrated soil builder and fruit producer. Put back into the soil at least a portion of the natural elements the orchard has taken out.

Home Products

Send for booklet "Good Reasons," tells you why "Natural Fertilizers" fertilize and return you many times the money spent for this unexcelled plant and tree food.

THIS WEEK'S COVER

Napa is one of the greatest fruit producing little counties. Notwithstanding that, our Mr. Briggs has been making some investigations which show that there is some livestock within the county boundaries. The scene on this week's cover is evidence of the type of Ayrshires produced in Napa. These yougsters were photographed on the Oak Knoll ranch of D. Melone. We doubt not their performance at the pail will show that they are not only handsome in appearance but in production.

RESTING

Prof. Liberty H. Bailey, editor of the Cyclopedia of Agriculture, the Standard Cyclopedia of Horticulture, and dozens of other valuable agricultural books, and author of many others, has just finished the final proof reading on the last, or sixth, volume of the Cyclopedia of Horticulture, and has shaken off all kinds of work for a deserved rest. He is on his way to the Far East, but during the past week has made California his first stopping place. The stop was all too short.

LETTUCE

The Imperial Valley is sending out this year over 500 carloads, of 304 crates each carload, of the finest lettuce we have ever seen. The heads are as large and almost as solid as small cabbages. The better cared for acres are producing about a carload, and the growers have made immensely on this year's production. The planting was in November. The harvest is on now and will continue for several weeks. This year's success will induce a much heavier planting next year. This will be in part controlled by the fact that the crop is one calling for much labor. The grower, unless able to employ help, can produce but comparatively few acres, but those contemplating extensive planting another year should look well to a market before they plant.

ANNUAL ASSEMBLY

The Imperial Valley farm bureau assembly is a live wire gathering. We attended one there last Saturday, and while the attendance of 1500, which was claimed by a local paper, may be rather optimistic, yet it was an immense gathering. Its immensity was most apparent in the enthusiasm shown in the discussions and in the disposal of the barbecue which was served at noon time. The Cultivator camera was busy, and another week will show how Imperial Valley looks when it is eating, likewise give some other information on that remarkable section. We wish that producers of other sections of California could show some of the enthusiasm of Imperial County pioneers and some of their desire to gather information as to best farming practices. True, they are impelled to this by their facing of conditions which obtain in practically no other section of the world. They have problems to solve which are so different that they have nowhere to go for the answer but to themselves. Hence they meet and discuss, and we have seen many a state fruit growers convention and other conventions which did not have one-tenth the attendance given to this assembly.

ARNOLD V. STUBENRAUCH

One of the brightest and strongest men connected with the University of California passed last Monday when Arnold V. Stubenrauch died.

He graduated from the University of California in 1899, took his master's degree in Cornell in 1901, and in 1901 and 1902 was assistant professor in the University of Illinois, coming at the close of 1902 to the University of California, at which institution he served until the end of 1905. In 1906 he took up work with the United States department of agriculture in the field investigations of pomology of the bureau of plant industry. Later, in 1910, he was made head of investigations and continued the direction of this work until 1914 when Dr. Hunt, seeking for some of the brightest minds of the country for building up California institutions, insisted upon his return to his own state university. Since then he has been a tireless investigator and a power in educational work along pomological lines.

Professor Stubenrauch was a fellow of the American Section for the Advancement of Science, member of the American Pomological Society, of the Society of Horticultural Science, the American Association of Refrigeration and the American Genetic Association. He was author of many bulletins and publications issued by the United States department of agriculture and the experiment station of the University of California. He was joint author with Mr. Buchanan of a Country Reader.

Prof. Stubenrauch was yet a young man, and California, especially its great pomological interests, will suffer because his activities have ceased. And with all his abilities he was most genial, wholesouled, and likable.

At the Recent State Fruit Growers' Convention
At the reader's right is the late Prof. Arnold V. Stubenrauch. The others are Prof. Lloyd and Commissioner Fox of Napa.

DATES IN ARIZONA

Arizona date growers are sensible. They are growing a fine product which, as a novelty so far as American production goes, would command a long price. But in speaking of the industry at the recent Imperial County Farm Bureau Assembly, Dr. R. H. Forbes, director of the agricultural experiment station of Arizona, said that Arizona date growers had determined to sell their output at a price which would let producers and consumers live. They are putting in small five-basket crates about five pounds of choice fresh dates which are sold at $1.00 per crate. Specimens of fruit were exhibited at the assembly which were certainly exceptionally fine fresh fruit.

Americans have not yet learned the art of curing the softer dates, try as they will. Because of the amount of syrup, or for some reason, they will not keep, but for fresh fruit, put into storage five months ago, as were the dates exhibited at Imperial, and sold to be consumed within a few days, or at least a few weeks, there is a great market. Some have been shipped to the Eastern coast and sold well and gave satisfaction. As noted above the price receipts above packing costs were a little above 16 cents per pound, to grower. Presumably American dates may sometimes be sold lower than that, but it is a satisfaction to see a trade being developed by asking of the consumer a price which will encourage greater demand. For commercial trade the ordinary sized berry crate holding 15 baskets is to be used.

Dr. Forbes insisted that the date industry was not yet an industry, that is, it is not yet developed to the point where its future can even be estimated. While the range in climate is not great almost any kind of soil will be tolerated by dates, but a dry, intensely hot climate and abundance of water are necessary. This is proven in California date producing sections by experience in Imperial Valley where date growing has not been so general as in the Coachella Valley which is warmer and much dryer than the nearer-the-ocean-section of the Imperial.

One problem to be solved is the artificial ripening which is necessary in Arizona, at least for most of the varieties that have yet been tried. This necessitates incubating, or placing in a temperature of 50 degrees Centigrade for a few days, then for a short time holding at 65 Centigrade or 150 degrees Fahrenheit. This destroys any bacteria or fungi which may be present. The dates are then packed in pound boxes and attractively labeled and placed in crates as indicated above.

Agricultural Notes

The Russian sugar beet crop proved a disappointment in not coming up to estimated tonnage.

Regulations have been issued for compulsory tillage of arable lands in Ireland in 1917 to insure greater home production of food.

South African beef growers are receiving record prices for their cattle. $209.25 is the highest price reported for an ox at recent sale.

A large majority of the creameries and cheese factories of New Zealand are owned cooperatively by small dairymen and general farmers.

The cane sugar production of the Hawaiian Islands for 1917 was estimated on January 1 by the Hawaiian Sugar Planters' Association at 633,920 tons.

Siberia consumed considerable amounts of California dried apricots, pears and peaches prior to the war. This fruit was mostly secured through shippers at Hamburg, Germany.

A tick eradication conference was held in Dallas, Texas, last week. A little over 400,000 square miles of territory now remain infested. The campaign of eradication will be pushed vigorously.

It is estimated that there are 150,000 persons and firms in Japan awaiting the installation of telephones on their premises, the government being unable to keep abreast of the demand for appliances.

The National Apple Growers, an association recently formed, met at St Louis in February to take steps to secure uniform grading laws in different states. Delegates were present from eight states.

America's consumption of sugar in 1916 was 78.13 pounds, six pounds less than the preceding year and 11 pounds less than in 1914. The world's production last year was 4,000,000,000 less than in 1915.

Oil of the soy bean is a palatable food widely eaten by the Chinese. This vegetable oil also is used in making paints, varnishes, soaps, rubber substitutes, linoleum, waterproof goods, lubricants, and printing ink.

Weather news is now received regularly by wireless at 270 amateur radio stations located in nine of the northern and western states. In this way the wireless operator is enabled to give his neighborhood the weather forecast as soon as it is issued.

Chile is developing as a fruit country. Its latitude is practically the same as that of California and similar production methods are being practiced. It is already exporting considerable quantities of almonds, dried fruits, etc., to neighboring South American countries.

At the fifth annual meeting of the Chamber of Commerce of the United States recently held at Washington, D. C., R. G. Rhett of Charleston, South Carolina, was reelected president and John Jay Edson of Washington, treasurer. Willis Booth of Los Angeles was elected a vice president.

Ontario has about one-half the milch cows of Canada. There has been a marked increase in average yield of milk, per cow. A large part of this increase is due to the campaign of instruction that has been carried on by the dairy division at Ottawa for the last 12 years, and to the weeding out of cull cows by the increased exportation of cattle—mainly worn-out animals.

Agricultural News Notes of the Pacific Coast

Northern California

Farmers in Nevada County are becoming interested in the organization of a county farm bureau.

The Colfax Fruit Growers' Association at its recent annual meeting re-elected A. L. Wisker president.

The continued dry, cold weather in Amador County has produced a serious situation for cattle on range.

It is announced that a stockyards is to be located at West Sacramento backed by Harry Thorp, J. H. Glide and C. E. Virden.

The Northern California Olive Corporation with a plant at Palermo is planning to operate its cannery throughout the summer.

A ranch of 155 acres near Benicia will be devoted to growing meat chickens. The company owning the ranch has announced that it will build a poultry plant at Benicia.

Butte County is planning for its spring exposition at Chico May 21-27. The management states, "We expect to make the exposition this year a live stock show above all else.

The rice mill of the Globe Milling Company at Woodland, one of the largest in the state, is just completed at a cost of $750,000. The rice from the time it leaves the warehouse is not touched by hand.

In response to a call issued by the forest service heep owners of Northern California gathered at Red Bluff last week to discuss grazing prcblems. Steps were taken toward the organization of a wool growers' association.

Horticultural Commissioner Stokes of Lake County writes that he is "exceptionally busy inspecting incoming trees. The planting this season will exceed that of last, especially in Bartletts of which over 28,000 have already been delivered and most of them already planted and we have yet two months more to plant in."

Central California

Madera will hold an agricultural and live stock fair next fall.

Tulare Lake is filling rapidly with waters from Kings, Kern and Tule Rivers, and grain farmers are fearful of flood damage.

The California Prune and Apricot Growers', Inc., announces that sufficient acreage and subscriptions have been assured to go on with the association.

Seventy-five representatives from irrigation districts all over California gathered at Merced last week to discuss irrigation bills pending in the legislature.

Squirrel Inspector Wiles of Kings County reports that fully 90 per cent of the land owners are cooperating with inspectors in the squirrel inspection campaign.

Horticultural Commissioner Collins of Tulare County, announces that during the past year 1424 cars of green fruit were shipped from the county, 1288 cars were grapes.

The Visalia Cooperative Creamery held its annual meeting and turkey dinner January 22. During the month ending January 15 this creamery received 285,000 pounds of cream.

Members of the Central California Poultry Producers' Association met last week in Petaluma to discuss marketing conditions. The association expects to market eggs from 1,500,000 hens.

The California Fruit Exchange has instituted a campaign for membership throughout the state, making special effort in the San Joaquin Valley. It now has 25 growers' associations affiliating.

At the recent annual meeting of the Tulare Cooperative Poultry Association dinner was served to 250 poultrymen and their wives. Interesting programs were given in the morning and afternoon.

Southern California

Orange will hold a flower show April 18-20.

Hemet, Riverside County, reports total rainfall for the season at 8.59 inches.

Bee men of Riverside and San Bernardino Counties last year shipped out $200,000 worth of honey.

Brawley shipped out 11 carloads of live stock on one day, Monday, January 29. On the same day a carload of cottonseed and three cars of milo were shipped.

Judges are now inspecting gardens of those who competed in the Redlands Horticultural and Improvement Society contest for home garden improvement.

Antelope Valley hogs topped the Los Angeles market last week at 10¼ cents. That the hogs were in good condition is shown by the fact that they dressed out 80 per cent.

The new contracts made this year between the California Lima Bean Growers' Association and growers will carry a penalty clause sufficient to deter members from breaking their contracts.

A mass meeting to discuss a flood control bond election was held last week at Pomona. The flood control plan calls for the construction of a series of reservoirs, the largest one to be located south of Lordsburg.

Manager F. A. Shipley of the State Lima Bean Growers' Association gave an address before bean growers of the Encinitas district recently, outlining plan for an organization of the growers to affiliate with the state association.

Truck growers of Riverside County are contemplating forming an association for the purpose of developing a home market for their products. At their recent meeting the growers were addressed by Prof. S. S. Rogers of the university farm.

The Coast

Farmers of Pierce County, Washington, have organized an association with Fred Chamberlain of Sumner, president.

At the recent convention of the Wool Growers' at Salt Lake City 800 delegates were in attendance. Every Western state and all live stock states in the Union were represented.

Farmers of the Salt River Valley of Arizona will have to pay $60 an acre for the construction of the Roosevelt reservoir. The first installment of two per cent is due December 1, 1917.

A cow testing association organized at Buhl, Utah, has finished a year's testing. Records show an average of 304.6 pounds butterfat of an average test of 3.76 per cent, average profit per cow $39.52.

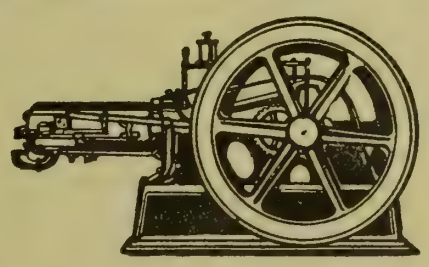
Berry growers of the Nooksack Valley of Washington have formed a fruit growers' association. Their 1917 crop has already been contracted at four cents a pound, an increase over last year's prices.

Cranberry growers of Pacific, Washington, and Clatsop Counties, Oregon, have organized the Pacific Cranberry Exchange at Astoria. This organization expects to handle about 10,000 barrels of cranberries the coming season.

At the recent annual meeting of the National Wool Growers' Association of Salt Lake a resolution was adopted asking the federal congress to appropriate $300,000 to fight predaceous animals, especially coyotes, which do such serious damage to the sheep industry.

The farm agricultural agent of Lane County, Oregon, who recently resigned because of lack of county funds, has been reinstated in his position and an appropriation for maintenance of the office assured through the activities of chambers of commerce and leading farmers.

It's up to You!



What are you going to do about that engine you are thinking of buying? Are you considering price or quality most? Do you want a cheap engine or a good engine? You can't expect very much from a cheap engine, because when an engine is made of poor material and poorly designed and constructed something is bound to happen early and often. Maybe you have had experience with the cheap kind, and are looking for quality this time.

Commercial Engines will give you more for your money and more genuine satisfaction than you ever dreamed possible.

It's up to you to get posted on the Real Thing in Pumping Engines.

An ironclad written guarantee protects the purchaser of every Commercial Engine. Write for handsome illustrated catalog showing details of construction.

Here is the heart of

THE NEW DE LAVAL

CREAM SEPARATOR

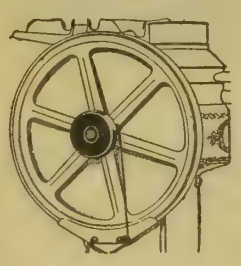
THIS is the new self-centering De Laval bowl with detached spindle, that is creating such a sensation in the dairy world.

This new De Laval bowl, with patented tangential tubular milk passages and patented removable milk conveyor, makes possible in a bowl of given size and weight, operated at a given speed, greater skimming efficiency and capacity than has ever before been attained in any other cream separator bowl.

These are big advantages that you can secure only in the De Laval.

But aside from the big advantages of greater capacity and closer skimming, there are many other important improvements in the New De Laval.

All discs are now interchangeable and are unnumbered. There are fewer discs. On account of greater simplicity of bowl construction, the New De Laval is easier to wash and, capacity considered, is still easier to run than before. High grade construction and design, together with perfect automatic lubrication, are a guarantee that the splendid De Laval record for durability will be maintained in the new style machine.



Every New De Laval is now equipped with a Bell Speed-Indicator, the "Warning Signal" which insures proper speed and uniform cream.

If you are trying to get along without a cream separator or with a half-worn-out or unreliable machine, why not get a NEW De Laval NOW and stop your cream waste? You don't need to count the cost, because the De Laval will soon pay for itself.

There is a De Laval agent near you who will be glad to explain all the improvements and advantages of the NEW De Laval, and who will set and start a machine for you on your farm and let you try it for yourself.

Why not see the nearest De Laval agent at once? If you do not know him, write to the nearest office for any desired information.

New Catalog will be mailed upon request

Feeding Rice

Written for California Cultivator By W. S. Quilford

YOUR Fresno subscriber asks for information about feeding hull rice. This is what is commonly known as "paddy rice." The rice hull is composed largely of silica, is indigestible and has no feeding value. Its composition is about the same as that of glass.

But whole, unmilled rice, either standing in the field, from the bundle or from the sack after it has been threshed, has been fed to horses, mules, cattle, sheep, hogs and chickens very extensively this season in the rice growing districts of the Sacramento Valley. And practically all of the reports are to the effect that it is one of the best grains grown in California for stock feed. Just now it is the lowest in price.

As I have written before, in many of the rice fields all of the work stock was fed nothing but rice and rice straw during the harvesting season, and many a thin old horse and mule left the job in far better condition than it was at the beginning.

Then hundreds of sheep and hogs have been fattened on the rice stubble fields, and many more have been fed in pens and feed lots.

Butchers report that rice fed pork is firm and of the highest quality. An Esparto grower sold two pigs recently to a butcher. The buyer and some other judges of the weight of hogs estimated them at 190 to 200 pounds each. They weighed 245 and 250 pounds respectively. I have a report of one big hog feeder in Yolo County who has fed rice to a large number of hogs this year. At one time he fed one lot rice that had been cooked, another lot whole dry rice just as it came from the sack. There was no difference in feed value. This may be accounted for in the same way as results of tests with whole Indian corn and corn meal, which generally show that there is not enough gain to pay for the cost of grinding. The hog has a wonderful digestive apparatus.

There are some who are trying out crushed and rolled and rolled and steamed rice, and another six months will see much more information on the feeding of these different forms.

Rice is considered to be of a little higher feed value than corn or barley.

Those who are feeding rice to chickens report good results, particularly when the fowls have the run of alfalfa for protein.

Rice can be secured from growers at many places in the Sacramento Valley.

Weighing In at Start of Pig Club Contest
A member of one of the Napa County Pig Clubs.

Analysis

According to Henry & Morrison's "Feeds and Feeding," rough rice contains: Water 9.6 per cent, ash 4.9, crude protein 7.6, fiber 9.3, nitrogen free extract 66.7, fat 1.9.

Polished rice is materially the same except that it contains practically no fiber and of course much less ash.

Rice bran, high grade, contains: Water 10.1 per cent, ash 9.7, crude protein 12.1, fiber 12.4, nitrogen free extract 44.3, fat 11.4.

Give the Brood Sow a Chance

The care of brood sows is a thing that should receive attention now. Feed is very high in price this season, but there is no better way to use it than in keeping the brood sows—those that have been somewhat thin at breeding time, in particular—in good condition and increasing in weight. The sow has not only her own bodily needs to care for but those of the litter as well. Read what Bob Evans says in the Duroc Bulletin about caring for the sow:

"When I travel over the country viewing the many Duroc herds and

Weighing Out at Finish

We have a choice lot of young sows and boars ready for delivery, sired by champion Iowa boars and out of big boned, prolific sows. A Wonder, Iowa King and Big Orphan blood—none better.

O. L. LINN, Route A, Modesto, Cal.

see the thousand and one handicaps placed on the old red sow, I wonder how she ever has managed to raise a mortgage, buy a phonograph or a flivver, or even provide sufficient meat for the home table. Because she is a hog she stands the neglect of the thoughtless, the haphazard method of the careless and the abuse of the ingrate, and withal pays more bills than all the other farm animals combined. What could she do with ideal care and comfort? Isn't she entitled to careful consideration?

"Individual houses with small lots with two, three or four sows to a lot are ideal conditions for sows after being bred and during ordinary winter weather. In this manner they have plenty of shelter from night and storm, do not pile up and get overheated and then chill, and if the houses are properly ventilated danger of pneumonia is lessened.

"Insist on lots of exercise for the sows during pregnancy, for the system naturally gets sluggish during the winter months and the sows are inclined to eat and sleep and neglect the more important function of moving about. Fix their feed and water so they will have to travel some distance between and see that they do the traveling. If this is impossible give them a range on fields and where there is some little green stuff to pick up and where they will have to exercise to get it. Sluggish systems bring on disorders, and diseases of many kinds are sure to follow. Keep the bowels open and the digestive organs working actively. Remember she is supplying sustenance for from eight to fifteen besides herself and laying up a balance for the suckling period besides. This cannot be done on little feed. Don't starve the mother or the litter. You'll cut your profit in the middle if you do."

Support the Live Stock Organizations

California producers of pure bred live stock are becoming very well organized. Almost every breed has a good association, and all of these deserve the hearty support of all who are identified with the various interests.

It goes without saying that every breeder should be a member of his breed association, but he should not stop at that. He should attend the meetings and be constantly alert to do anything possible to make the organization a big success. For the business of every one breeding animals should be increased by a good live organization. If the association is doing what it should the breed will receive a great deal of publicity that it would not otherwise, and through it many new breeders should be added to the ranks annually. Then it should make a lot of demand for boars, bulls, rams or stallions to be used in improving the grade stock of the country.

Occasionally a breeder is found who laments the fact that too many are raising animals of the same breed that he had. Men of this sort are few and far between. The majority of pure bred live stock men are broad minded, far-seeing individuals who realize that there will be far more business for all if there are a dozen establishments producing one breed of animals in a locality than if there is only one.

When there are a number of herds there is more discussion of the breed locally, and if the representatives have merit, an increasing local demand. And the community soon becomes more or less widely known as a "center", depending on the energy, ability and resourcefulness of the breeders, and the amount of advertising they do.

The raising of pure bred domestic animals is coming to be a better business in California every year.

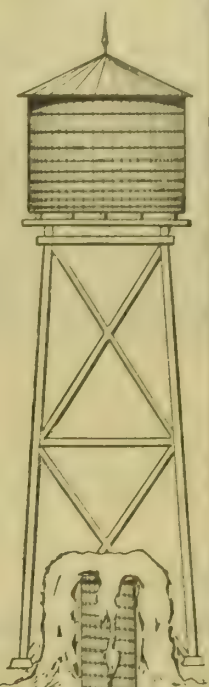
Remco

SILOS

For dairymen, farmers, feeders in all sizes and proportions.

TANKS

For water, wine, oil, vinegar, acids for storage, mixing, fermenting, pickling.



PIPE

For irrigation, power, water supply, in all diameters and for all pressures. Costs less than any other pipe of equal efficiency and endurance. Outlasts any pipe except cast iron.

COUNTY OF COMPACT RESOURCEFULNESS

Continued from Page 187

At present then the man who intends to raise stock in this county must realize that he will have to till his land carefully in order to grow sufficient forage to feed the stock and get the best results. This has been done very successfully by a number of farmers in the county. We have several breeders of pure-bred stock who are doing splendidly by careful feeding and still more careful selection and breeding of animals, which enables them to get exceptionally high prices for the stock produced.

There are at present a number of Duroc hog breeders in the county, among whom we might mention W. W. Everett, S. S. Southworth, H. E. Boudier, C. E. Durrell, F. M. Johnson and M. Derby. Len D. Owens of Aetna Springs and Wentworth & Rossi of Napa are breeders of pure-bred Poland-Chinas. C. F. Tubbs of Calistoga has an excellent herd of Yorkshires. I. R. N. Boid of St. Helena is also going into the Yorkshire business, in addition to which he has shipped in a number of milking Shorthorns. Shorthorns are also being bred by William Watson of Napa Junction who has made some very fine records with these animals.

The pure-bred Jersey breeders of the county are W. L. Mitchell and F. M. Johnson, while the Holstein breeders are represented by the Napa State Hospital, Dr. Ben Stetson and Homer Hewins.

The Guernseys are being bred by B. E. Nixon who has a very large establishment and some extra fine stock, also by William Watt. One herd of Ayrshires is owned by the Melone Company.

Some very fine horses are being bred by the Spreckels Stock Farm, also by Henry Wheatley.

While this is a small county we have some exceptionally fine livestock. The interest the breeders are taking in better methods of management is very encouraging. There is no reason why Napa County could not become noted for its pure-bred livestock, as this industry is at present being very much encouraged and fostered by the Napa County Livestock Association which has recently secured the services of Dr. R. E. Dedrick, a graduate of Cornell Veterinary College, who has been appointed county livestock inspector.

Beef Cattle in Berryessa Valley

The climatic conditions of Napa County are ideal for livestock. With its rich, fertile valley and gentle sloping hillsides leading up to mountain crests from which comes the pure, clear water that is necessary for successful livestock raising, we have natural advantages which cannot be excelled anywhere. The temperature here rarely goes above 100 degrees in summer nor below freezing in winter, so that the hogs do not suffer in the summer nor does the poultry suffer in winter. The climate here is pratically ideal for both man and beast, and there is no reason why the livestock industry of the future should not thrive and prosper.

Chester Whites on Oak Knoll Ranch

NOTES ON NAPA LIVE STOCK

Near Calistoga is the Montelena Ranch of the A. L. Tubbs Co., managed by C. F. Tubbs. The ranch is well located with both bottom and hill lands. At present the pure bred interests are confined to Yorkshire swine, there being 150 of well bred animals on the place. The senior herd boar is Miner's Hearts Delight from

Cultivate the habit of reading advertisements and get the news of the manufacturing world.

Farm Chazy, New York. The Junior herd boar is Grove Hill Doch, from John Campbell's Lynn, Indiana, herd. This boar's granddam was first in all classes at the Chicago International Live Stock Show in 1914. Modern equipment in the way of yards, houses and feeding arrangements mark the farm. While the Yorkshires are the only pure bred stock on the place it is the intention of the manager to work into a herd of pure bred Holsteins.

Frank B. Stetson, Napa, breeds Berkshires and has some good ones, 20 head in all, headed by Oak Superb, a son of Superbus. Mr. Stetson is constructing a new hog house on modern lines.

S. S. Southworth, Napa, has about 20 head of Duroc-Jerseys, herd boar, Napa Chief of Chief's Colonel breeding. He has a number of especially fine sows.

E. C. Spear, St. Helena, raises pure bred Rambouillet sheep and usually carries from 500 to 600 ewes. His 1917 get of rams is in demand for breeding purposes.

On gently rolling land the 85 acres of F. M. Johnson of Napa provide a home for his fine foundation herd of strictly big type Duroc-Jerseys. Mr. Johnson is adding new blood of "quality" stuff. He will soon build a modern piggery to house his stock. Bondholder 13, first senior yearling at California State Fair, 1916, and grand champion at Napa County Fair, 1916, heads his herd. The farm also keeps a foundation herd of pure bred Jersey cattle of execllent breeding.

At River Bend Farm, St. Helena, 245 acres in extent, with 100 acres of good bottom land, you find Duroc-Jersey swine of the right kind. This herd is led by River Bend High Model of Crimson Wonder and Defender Stock. He was second in senior yearling class at Sacramento in 1916. His sire was High Model and was owned by W. N. Shanks of Minnesota, who won six grand championships with him at different fairs. One of the sows is Defendress of River Bend. She is a daughter of Defender out of Radiant Model. Her sire sold twice for $5000. This establishment is well located on the banks of a stream of pure water, has model arrangenents of buildings, yards and driveways, raises grain and alfalfa for feed on the place, irrigating from wells and pumps. It is well worth a visit.

B. E. Nixon's Revada Farm, Napa, is the home of a herd of pure bred imported Guernseys. It is 600 acres in extent and has some very fine bottom land. A reservoir of 35,000 gallons crowns the summit of a hill overlooking the farm buildings which are thoroughly modern and up-to-date. The milking barn, 162x37, with latest equipment, stables 80 head. Two 150-ton silos at the end of the barn furnish feed. At the other end of the barn is the completely equipped milk house with its cooler, separator, refrigerator and sterilizing plant. There are now 76 head, 37 of which are mature cows. The senior herd bull is Imported Robert Secre. The junior sire is Ricardo of Edgemoor, first, junior and reserve grand champion, Sacramento, 1916, and first in class and junior champion at San Francisco, 1915.

The Veterans Home at Yountville has 60 head of pure bred Holsteins and 350 Tamworth swine. They also keep 3000 hens, the institution taking the entire product for its own use.

The Stock Farm of A. B. Spreckels at Napa is devoted largely to the

Elliott-Brant Rancho Guernseys Are Persistent Producers

PRINCESS OF MEADOWBROOK, a six-year-old cow, averaged 40 pounds a day of 5% milk for over a year. This rich milk brought 16 cents per quart, a gross income of $1,168 for the year, or $3.20 per day.

LOIS VALENTINE'S LAD'S LASSIE, a two-year-old heifer, averaged nearly 30 pounds milk per day for a year, producing more in her tenth month than at any time previous. The gross income from the sale of her milk was $842.40, or $2.33 per day.

It cost about 25 cents per day to feed these cows.

Compare these results with those of other herds and breeds.

Butter and Cheese Scoring Contests at University Farm

During the year six scorings were held. One hundred and sixty-one cubes of butter were entered by 54 different creameries. This represents 29 counties. Several entries were received from outside the state. The average score on all butter entries was 91.89. The average per cent of moisture was 13.31, salt 2.16. Under the 1916 plan certificates will be issued to butter makers under the following averages:

Grade A Certificate, average score of 92 or above on six entries, Grade B Certificate, average score of 93 or above on five entries, Grade C Certificate, average score of 90 to 92 on six entries.

Butter makers who will receive certificates are: Grade A, L. Larsen, Sunset Creamery, Loleta, 93.16; P. Peterson, Valley Flower Creamery, Ferndale, 93; J. N. Jensen, Visalia Cooperative Creamery, Visalia, 92.83; G. G. Plunkett, Exeter Creamery, Exeter, 92.66; Ed. Hooper, Spreckel's Market Creamery, San Francisco, 92.5; Bert Myers, Los Angeles Creamery Company, San Luis Obispo, 92.16. Grade C, H. C. Nielsen, Martinez Creamery, Martinez, 91.75; J. C. Phillips, Delta Creamery, Imperial, 91.33; H. R. Pyke, Orland Butter & Cheese Co., Orland, 91.25.

Ninety-nine cheese (44 Cheddar, 42 California (granular) and 13 jack) were entered, representing 23 factories. The average score on all the cheese was 91.27. The following is the average score and moisture on the different classes of cheese: Cheddar, 91.46, 37.45 moisture: California (granular), 90.85, 39.8 moisture; jack, 91.73, 41.5 moisture.

Certificates will be issued to cheese makers under the following averages: Grade A Certificate, average score of 92 or above on five entries; Grade B Certificate, average score of 93 or above on four entries; Grade C Certificate, average score of 90 to 92 on five entries.

Cheese makers who will receive certificates are: Grade A, Chris Kolbeck, Henderson Company, Galt, 93.25; Grade A, A. J. Davis, Los Animas Cheese Factory, Gilroy, 92.3; Grade A, J. A. Scaroni, Santa Cruz, 92.1; Grade C, C. Ebbe, Watson Cheese Factory, McArthur, 91.7; A. Schoenrock, White & Terry Cheese Factory, Galt, 91.6; H. C. Watson, Watson Cheese Factory, Bieber, 91.5; John Reber, Watson Cheese Factory, Bieber, 91.16.

WHAT STOCKYARDS DO FOR FARMERS

"An institution that is doing its share to solve the problems of bringing producer and consumer into more economical relation is the Spokane Union stockyards," says the Idaho Farmer. "It has only service to sell, neither buying nor selling live stock itself. As Walter D. Roberts, its president and manager, puts it, 'We speculate in nothing.'

"This company, whose ownership is widely distributed among 150 stockholders in the Inland Empire, has invested $407,000 in land and buildings. Its plant covers 24 acres on the main line of the Northern Pacific, three and one-half miles east of the center of Spokane. It can put 4000 hogs and sheep under cover, and 1600 to 1800 head of cattle. It is just a big live stock hotel.

"Suppose a farmer anywhere in the Inland Empire wants to sell a carload of cattle on the Spokane market. He can either bring in his stock himself or send it to the company. For the service given at the yards he will pay a yardage charge of 25 cents a head plus the value of the feed consumed there by his cattle while finding a buyer. This yardage charge of 25 cents per head is always the same whether the cattle are sold in a day or kept there a week.

"As many as 40 competing buyers have been at the yards at one time but as a rule there are from three to six. Two commission merchants are authorized by the company to handle business for shippers who may desire their services, but they are independent of the stockyards. Their authorized commission is $10 a car for hogs, $15 a car for cattle.

"The Union stockyards have been operating a little more than a year and the growing popularity of the service is attested by the fact that

Whittier State School

Whittier, Calif.

from November 1, 1915, to November 1, 1916, live stock of the value of $2,876,000 was put through. In October, 1915, 44 cars were handled; in October, 1916, 222 cars.

"Before the Union yards were opened Spokane live stock prices averaged from 85 cents to $1.00 per hundred below the Seattle and Portland markets. Spokane prices to producers are now on a parity with Coast prices, and Manager Roberts says there have been days this winter when the price of hogs here was the highest in the United States.

In these times when the whole nation is aroused over the problem of cutting out some part of the middlemen's profits, service of a kind given by the Spokane stockyards merits friendly approval."

FIELD NOTES

At the time of this writing, February 7, the continued dry weather is having a marked effect on prices of all kinds of cattle. In some sections the price of alfalfa hay has reached $25 per ton, and owners are exceedingly cautious in making any further additions to their herds. Yet there is a tremendous pent up demand for most kinds of cattle that will turn loose in a veritable flood after the next good rain. Should the rains come in quantity to insure even fair feed there will be a grand scramble for cattle in California within the next 60 days.

Fred W. Kiesel, president of the California Holstein-Friesian Association, has appointed an executive board for the association that is particularly strong and promises to put the association to the front in the campaign for better dairy cattle and dairying in California. The board is composed of seven members, as follows: W. H. Taylor, superintendent of Santa Anita Rancho, Santa Anita; J. M. Henderson Jr., president Sacramento Bank, Sacramento; Owen Duffy, business manager Napa State Hospital, Napa; A. R. Magruder, cashier of the Bank of Ripon, Ripon; A. W. Morris, Woodland; Frank M. Helm, Fresno; Gion W. Gibson, Williams. Mr. Kiesel has some well defined plans for an active campaign for the association in which the executive board is in the fullest sympathy, and it is hoped that the work of the association will do much to better the great Holstein breeding and dairying business of California.

A 28-Pound Record at Sunnyside.—Gradually the records are reaching higher levels in Sunnyside herd of registered Holsteins, owned by R. F. Guerin of Visalia. The latest maker of a new high record for the herd is Lady Leola Hengerveld who recently completed an official seven-day test with 28.08 pounds butter and 448.4 pounds milk to her credit. She is sired by Arcady Pontiac Wayne Hengerveld, 24 A.R.O. daughters, and she, together with her dam and granddam were all bred and raised at Sunnyside. Mr. Guerin reports a number of sales of breeding animals recently, among them a daughter of the good old cow Sacajawea to Clifford Farm Company, and a choice bull to E. L. Robertson, Tulare County.

George Chandler, the well known Oregon Hereford breeder, won grand championship in the recent Denver show for the best carload of breeding bulls, all breeds competing. The lot consisted of 15 yearlings, and The Hereford Journal states that they were much admired by breeders because of their unusual scale and strength of bone. They were sold in one lot for $575 per head to E. L. Dana of Wyoming, the owner of Superior Fairfax, the bull for which Mr. Dana paid $10,000 at public sale.

The second prize carload of registered Hereford bulls at the Denver show, consisting of 15 sons of Beau Carlos 2nd, exhibited by Davis-McConnell Company, of Wyoming, sold for $500 a head after the show to Tomkins Cattle Company of Colorado.

Dispersal of Lakeside Holstein Herd.—An echo of the disastrous flood which swept the fertile little valleys of San Diego County a year ago is found in the offering at public sale of the Lakeside Holstein herd owned by H. I. Shaw. Mr. Shaw lost all of his barns and part of his land in the flood, and has finally decided to sell his entire herd. The herd consists of 23 head of registered Holstein females two registered Holstein herd bulls and 27 high grade Holstein cows and heifers. The pure bred herd has been built up from a foundation which Mr. Shaw selected carefully some years ago, and while no official testing has been done in the herd the cows show every evidence of being able to perform creditably if given a chance. The lack of official records will undoubtedly have an effect on prices in this sale, and there will be some real bargains for some one. The sale is under the management of California Breeders' Sales and Pedigree Company, and Col. Ben. A. Rhoades will officiate as auctioneer.

A seven-year-old grade Holstein, fresh in November, owned by Peter Truog, produced 1788.7 pounds of milk testing 4.1, according to the December report of the official tester of the Arizona Pioneer Cooperative Cow Testing Association. This made 73.3 pounds of butter fat, equal to over 85 pounds of butter, which at the wholesale price of butter for December would have brought $34.

The great increase in the number of dairy cows in the Salt River Valley of Arizona during the past year is creating more demand for silos. Mr. J. Stanley Howard, one of the pioneer dairymen and one of the moremost breeders of Holstein-Friesian in Arizona, states that it is his belief that 500 silos will be put up in the Salt River Valley during the coming year.

400 Pounds Butter in 90 Days

AAGGIE ACME OF RIVERSIDE 2d

California State Butter Record

Butter 7 Days 35.38 Lbs. Milk 627.3 Lbs.
Butter 30 Days 142.34 Lbs. Milk 2730.7 Lbs.
Butter 60 Days 275.02 Lbs. Milk 5365.0 Lbs.
Butter 90 Days 400.96 Lbs. Milk 7931.3 Lbs.

The above records are strictly official. She is a daughter of our herd sire, KING MEAD OF RIVERSIDE, who is transmitting with great certainty

HEAVY PRODUCTION - HIGH TEST - GOOD TYPE

There is no surer or quicker way of breeding these qualities into your herd than by the use of one of his sons from one of our high record cows. All of the daughters of King Mead of Riverside that have been tested for the year have an average of 4 per cent fat, and five two-year-old daughters have an average of over 700 pounds butter and over 14,000 pounds milk. We are offering several of his sons that carry more than 50 per cent of the blood of Aaggie Acme of Riverside 2d.

Pedigrees and prices will be submitted by request.

DISPERSAL SALE

Lakeside Dairy Holsteins

We are instructed by Mr. H. I. Shaw, owner of the well known Lakeside Dairy, to sell at public auction his entire herd consisting of

23 Registered Holstein Cows and Heifers
2 Registered Holstein Herd Bulls
27 Grade Holstein Cows and Heifers

This is one of the best working herds in Southern California, and the registered stock carries the breeding and the type to make good on official test if given a chance.

The grade cows are mostly young, well marked, and a nice clean lot.

Mr. Shaw lost all of his barns and part of his land in the flood of last winter and has decided to retire from the breeding and dairy business, otherwise this splendid herd would not be for sale.

Sale will be held on Thursday, March 15, 1917, on the Thum Ranch, half mile east of Lakeside, 20 miles east of San Diego, California.

Prepare for Spring Calving

By Ordering

HOOD FARM BREEDING POWDER

In order that you may treat every cow after calving with this Powder. It is the most economical thing you can do, because it keeps cows in a normal, healthy breeding condition; makes them clean quickly; breed readily; there is less use of the bull, and little danger from abortion. You should also order

JERMKIL

to prevent and check infectious diarrhoea and white scours in young calves.

For ordinary scours caused by indigestion, order

HOOD FARM CALF SCOUR TREATMENT

consisting of Hood Farm Calf Scour Remedy and Hood Farm Digestive Powder. Include in the order

HOOD FARM MILK FEVER OUTFIT

and

HOOD FARM GARGET REMEDY

and you will be well prepared to meet the emergencies which frequently arise at calving time.

Prices, information and advice gladly given. Mention this paper.

Berkshire Hogs—Milking Shorthorns

Breeding Stock For Sale

G. A. Murphy - Perkins, Cal.

NOTES ON NAPA LIVE STOCK

Continued from Page 203

breeding of thoroughbred horses. About 100 are on the place, including 53 brood mares and four stallions. Fifty head of grade Shorthorns headed by a pure bred bull and 150 Duroc and Berkshire swine, not registered but with pure bred boars, comprise the live stock other than horses. Two thousand hens are kept. The place is a model of neatness, both as to condition of land and buildings, and is a credit to its owner and to the manager, Walter De Bretteville.

Mrs. E. M. Holje, Calistoga, has a splendid farm of 474 acres, 275 of which are in the bottoms. The live stock interests are represented by eight pure bred Holsteins of fine type. The herd sire is King Segis Riverside sired by the well known King Segis Pontiac Emperor. Twenty-one registered Berkshires of exceptional quality and blood lines are housed in modern style and make a foundation herd that will be heard from. The manager of the farm, Homer Hewins, Jr., also has foundation herds of his own, in number four Holsteins and 16 Berkshires. He plans to increase this number by adding some animals of the big, robust typey kind. They will be of the best.

Dr. Ben Stetson, Napa, breeds Holsteins and has a foundation herd of 20 good ones. No one is more enthusiastic as to the merits of the Blacks and Whites, and Napa County is fortunate in having a breeder of this kind.

H. E. Boudier, Napa, has a neat farm of 30 acres. His herd of Duroc-Jerseys is headed by Royal Col, second prize winner as a junior at the State Fair at Sacramento in 1916.

C. E. Durrell, Napa, has a herd of 14 head of Duroc-Jerseys.

The Grange Stock and Poultry Farm, Yountville, Mrs. F. S. Granger, is 540 acres in extent. They breed Duroc-Jerseys, now having about 100 head. Herd sire Monarch of the Nook. They have a modern milking barn for 32 head and a 100 ton silo. Twenty-five hundred laying Leghorns represent the poultry end of the farm.

At the Napa State Hospital is the most modern equipment and 230 head of Holsteins. There are four bulls: Lord Asa, Admiral of West Lawn, Soseal Prince, and Prince Rag Apple Imperial. The last is the junior bull but will soon head the herd. His sire, Prince Rag Apple Imperial Korndyke, a three-fourths brother of the $25,000 bull, Rag Apple Korndyke, runs back to four crosses on Pontiac Korndyke who is the sire of 137 A. R. O. daughters. This young bull is located right and should make his mark. Pure bred Berkshires are kept, about 60 at this time. The herd boar is Kentucky Duke Third. There are about 600 head of grade Berkshires in addition to the pure breds.

Desford Banker
Shire Stallion Owned by Henry Wheatley

W. L. Mitchell, Napa, breeds Jerseys, 40 grades, two pure breds, with pure bred bulls. There are 200 acres in the farm, 90 acres in rich bottom land. Mr. Mitchell has pure bred Poland-China boars at the head of his swine herd. His two pure bred Jerseys are Columbiana's Merry Maiden, sired by King Milan's 2nd Son, dam Merry Maidens Columbiana; and Jacoba Irene's Bessie, sired by Jacoba Irene's Premier, dam Bessie Sears, who was a daughter of Jacoba Irene, a former world's record cow.

The Oak Knoll ranch of the D. Melone Company, Napa, has 2500 acres, 900 of which is in cultivation. There are 60 acres of alfalfa and 350 acres in orchard. Apples, pears, cherries and prunes are the principal fruits grown. Two water systems, gravity and pumping, furnish a plentiful supply of water. Two shipping stations, one on the electric and one on the steam railroad, both on the farm, furnish the very best shipping facilities. Good, well equipped, well arranged farm buildings house the stock and make up the working plant. The piggery is ideally located for drainage, shade and water. The yards and quarters for the hogs are excellent. The silo capacity of the farm is 280 tons.

Mr. Melone believes in the Chester Whites, and the 250 specimens of that breed on the place speak well of his judgment in selecting good foundation stock and his skill as a breeder. The herd is in charge of L. S. Edington and is well cared for. The Ayrshires

Every time you buy an article, advertised in t California Cultivator, at the local store you do yo town some good.

are the breed of cattle chosen to turn feed into profits. A large amount of hillside pasture seems to be the ideal place for them, and they are certainly doing well under these conditions. There are now 14 pure breds, headed by Moonstone of Steybrae. A milking machine is used and proves satisfactory. All manure is housed from the weather in a cement lined and floored building. Efficiency everywhere is the motto.

In the county there are a large number of farmers with a few good pure bred animals, both cattle and swine. A large number still have pure bred boars and bulls to head their herds and grade them up. The outlook for pure bred live stock in Napa County is a good one and will be watched with much interest by the breeders of the state.

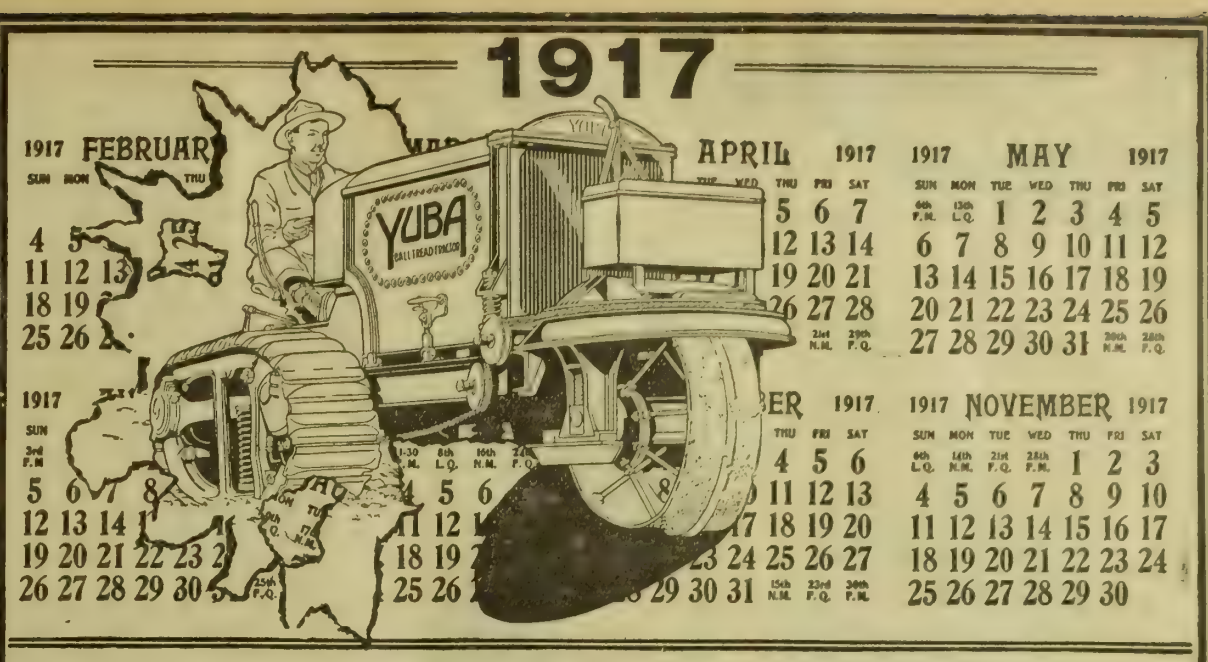
Pin Worms in Horses

In the Cultivator of February 3 I noticed a remedy for worms in horses, it being taken for granted that they were stomach worms. I have two horses that have had worms since the first of the year. They are white, slender and about three inches long. I have used some wood ashes for a few days but have noticed no improvement. Would like to know if they are stomach worms so I can use the rest of the treatment.—Subscriber, Klink.

The worms you describe are pin worms and only infest the lower bowel and rectum. Almost any remedy given by the mouth has lost its strength before reaching them, although the salt and ashes will usually get them if continued long enough. The quick and sure way to destroy them is to steep eight or ten ounces of scrap tobacco in three gallons of water for 15 or 20 minutes and when cooled to the temperature of the body strain and inject all into the rectum at one time. Make the horse hold it as long as you can. It will destroy all the worms it reaches but you better repeat the treatment once a week for three or four weeks to get those that hatch out later.

Cows Failing to Breed

We have been having trouble for about two years with our milch cows not getting with calf. We have had to take them to the bull several times and some finally get with calf while others are still coming in heat regularly when they should be coming fresh. We have changed bulls and have disinfected the cows with one-half per cent solution of lysol before taking them to the bull and before and after calving, but see little improvement. Do not think it is regular contagious abortion or the calves would be coming before time, which they are not. If you can give us any light on



All the year around tractor

THE SPRING RUSH is the busy season for Yuba tractors—no time for adjustments, not a moment to be used in making repairs. The busy plowing season is a test of the stamina and sturdiness of the Yuba.

But no matter how successfully a tractor comes through this endurance test, it is not necessarily a good investment. The spring plowing season does not last long.

If the tractor is to make good as a year in and year out investment, it must do more than the plowing. It must have the power to pull a harvester, the steadiness to drive a thresher or a pump, the speed for light discing or harrowing and the flexibility for road hauling.

The Yuba meets these conditions. It is an all-year-around tractor. It combines sturdiness and versatility. It replaces all your horses.

Lime or Gypsum

Lime $4.25 Ton Carlot Gypsum $4.50 Ton Carlot
H. B. Matthews, 485 Jackson St., Pasadena

"Short Measure-eh?"
A cow can not *tell* you when she is sick, but her milk yield is a very accurate indication of her condition. The fact is, thousands of cows are allowed to remain unprofitable or below their reasonable standard of productiveness through their owner's failure to act on the hint of the milk pail. Don't pass it off by simply calling her a "backward cow"—correct the trouble and reap the extra profit.
Kow-Kure is a medicine for cows that are "off color." It is in no sense a food, but it promptly acts on the digestive organs and enables the cow to thrive on her natural food. Its great curative powers act on the genital organs where many cow ailments originate. The success of Kow-Kure is positive in the prevention and cure of Abortion, Barrenness, Retained Afterbirth, Milk Fever, Scouring, Lost Appetite, Bunches and other common ills.
You can buy Kow-Kure from feed dealers and druggists, in 50c. and $1.00 packages.

The Pioneer Hatchery
320 So. Spring St.
LOS ANGELES, CAL.

When writing advertisers, mention The Cultivator.

the subject it will be appreciated.—Subscriber, Escondido.

It is not contagious abortion. Your cows may be too fat and not getting enough exercise. Reduce the feed and give plenty of salt. Also give them a teaspoon of sulphate of iron in the feed occasionally. See that they get plenty of exercise, and just before breeding give them a drive of five or ten miles. It will heat up the blood and they will probably get with calf all right. That is getting back to nature, you know, being in good form for breeding after an unusual amount of exercise.

Rheumatism

What can I do for a mare that is stiff in the fore parts? She has been that way for the past three years and of late is getting worse. She can only take steps about a foot long, and her knee joints crack loudly when she walks.—Subscriber, Exeter.

It is probably rheumatism, and being of so long standing will be hard to cure. Try these powders: Salicylate of soda, bicarbonate of soda, nitrate of potash and farina, of each four ounces. Mix and give a teaspoon in the feed twice a day for a week, then once a day while the powders last. Also cook all the grain you feed her by pouring boiling water over it and letting it cool before giving it to the mare.

Worms in Dog

I have a well bred Collie dog that has spasms about every day, and I can not find out what causes them. He is about one year old and has been having the fits for over two months. I thought it might be worms and gave him worm medicine but he is no better. At times his jaws stretch open as far as possible and he appears to be choking. What is it?—Subscriber, Porterville.

The spasms may be due to worms or chorea, but probably it is worms. The gagging or vomiting would indicate stomach worms. Get of your druggist ten powders, each containing 15 grains of powdered areca nut and ten other powders, each containing ten grains of santonin. Give one powder of the areca nut every morning in half a cup of sweet milk and one of the powders of santonin every evening by just dumping it back on the dog's tongue. You will probably notice some of the worms in the dog's passages and see an improvement in the dog in a week or ten days.

Barley Beards

I have a mare that last April had gathering under the jaw caused by barley beards working through at the root of the tongue. It broke. We have never been able to heal it. It is still running and the odor is very disagreeable. Otherwise she seems all right.—Subscriber, Elsinore.

The opening in the mouth where the barley beards first started to work down into the tongue may still be open, and probably there are still some beards in the passage between that and the opening on the outside. Cut the skin at the outside opening large enough so you can put your finger in and remove all the beards. Then once a day wash out the canal with a solution of permanganate of potash, one dram to the pint of water. Use a syringe and force the solution through into the mouth if possible. Feed something beside barley until this is healed.

Diabetes

I have a stallion that I have been working for several years but this year seems "all in". He does not keep up in flesh and the only thing I can see that is wrong is that he makes water oftener than seems necessary (eight or ten times in half a day). Could that be wholly responsible for his condition? If so, what is best to do for him?—C. F. H., Subscriber.

The symptoms are those of diabetes, and there is always great weakness in those cases. Get your druggist to prepare this: Iodide of potash three ounces and water one quart. Give a tablespoon of the liquid in the feed or water three times a day for a week, then once a day while it lasts. Also get five pounds of ground flaxseed with the oil in, and once a day prepare some flaxseed tea by putting a large handful of the meal in a bucket and pouring on it a gallon of boiling water. Let it stand until cool then fill the bucket with cold water and let the horse drink it. Feed him laxative feed as far as possible. Some carrots would be good for him.

Worms

In the Cultivator of February 3 you gave a treatment for worms in a horse, using tincture of iron and barley. How often and how many doses shall I give?—Subscriber, Reedley.

If you will read the article in the Cultivator of February 3 again you will find that it says give the medicine twice a week, and it also says to get eight ounces of the tincture of iron, that would be eight doses and would last four weeks. Notice also that the article does not say barley but coarse bran. I think that if you will read the article carefully and follow directions accurately you will get the results you desire.

Efficient Feeding

Written for California Cultivator By Jean A. Koethen

THE problem of feeding poultry has probably never been quite as difficult as it is just now. The unprecedented rise in prices of feed without a corresponding rise in prices of eggs puts the feeder on his mettle to hunt out some way of producing the same number of eggs as before with cheaper feed or less of it. He must steer between the Scylla of unjustifiable expense on the one hand and the Charybdis of underfeeding on the other. Making bricks without straw was nothing to this task.

And let me say right in the beginning, it is a task the poultryman ought never to be called on to face. In other kinds of business, when cost of production increases the price of the finished article increases with it. Shoes, dry goods, groceries, clothing of every description have gone steadily up in price. The prices of eggs and poultry alone have remained the same, or practically the same. Is not this absurd? Dr. Prince T. Woods says this is because the poultry producer has been willing to be the "goat," that he has not only gone on working tremendously hard for the barest scrap of a profit or none at all, but he has actually bragged about the big returns he was getting for his labor. Other producers have acknowledged that they could not make a living without charging more for their goods. The poultryman, who really doesn't know what it does cost him to produce a dozen eggs, has gone on selling at the old prices and wondering why poultry doesn't pay.

All this is going to be changed, but until poultry producers are so thoroughly organized that they can demand a fair price for their output, as other producers do, we must leave no stone unturned in our search for the feed which will produce most eggs with least expense.

Efficient feeding considers two things, the cost of the feed and the work it will do. A feed that is actually cheaper in dollars and cents is no cheaper if it produces fewer eggs. We are learning, however, that some of the cheaper feeds are nearly, if no

uite, as efficient as the higher priced eeds we have been accustomed to hink absolutely necessary. Take heat, for example. We used to think e could not feed hens without it, but e are finding barley a very good substitute. The feeding value of the two rains is about the same, and while he barley contains more fibre, this nay be so softened by steaming or prouting that the barley is quite as ood as wheat.

Next to barley, our cheapest grains re kafir and milo. Either of these vith barley, using, perhaps, the barey in the morning and the other grain t night, makes a fair combination.)ne man I know, who feeds 2500 hens, teams the barley for the morning feed nd gives a light feed of milo or kafir t night. For smaller flocks sprouting s to be preferred to steaming for the arley, because it puts the hull into nore palatable shape. Indeed careful eeders are agreed that sprouted rains, vegetables and greens offer the nly hope in the way of a solution of he problem. Hens that are given all he sprouted barley they will eat, and dry mash always accessible, will lay well with very little other feed. All owls are very fond of the sprouted rain and will consume large quantities of it, and when it has been sprouted four or five days there is still considerable nutriment left in the grain in addition to the value of the sprout as green feed.

According to Professor Jaffa's table, barley that has been sprouted five days contains: Water, 54.66 per cent; ash, 1.34 per cent; crude protein, 5.92 per cent; starch, sugar, etc., 32.93 per cent; crude fibre, 4.06 per cent; crude fat, 1.09 per cent. The dry seed barley contains: water, 7.96 per cent; ash, 2.74 per cent; crude protein, 12.52 per cent; starch, etc., 68.91 per cent; crude fibre, 5.79 per cent; crude fat, 2.08 per cent. Examination of these percentages shows that while the sprouted barley contains a good deal less protein it also contains less fat, less crude fiber and less starch and sugar. In other words, the birds will have to eat a good deal more of the sprouted barley than of the dry in order to get the same amount of protein, but it is in a form of which they can eat more without cumbering their digestive organs with fat and carbohydrates.

The very best way of sprouting barley for a small flock is to bury it in the soil of the run. It may be either dumped, after it has been soaked 24 hours, into holes dug here and there, or the surface of the ground may be scraped away to a depth of three or four inches and the grain spread over the exposed surface and covered. It does not matter if it is not all covered, for the hens will get it and with it all the enjoyment that comes from stolen sweets. As soon as it has sprouted, a shovel full or so turned up each morning gives the birds their breakfast and a chance to dig in the soft dirt for other succulent bits of green. What is not found and eaten in the first stages of sprouting will appear above ground sooner or later.

Eastern writers have a good deal to say about potatoes as a cheap poultry feed. In California they could hardly be called cheap and they are certainly fattening. Other vegetables, however, such as turnips, carrots and mangel beets, might be raised for poultry on almost any ranch, for a small patch of ground can be made to produce a large number of either. The beets are usually fed raw, but the turnips and carrots are best served cooked and made into a mash with ground grain. I know of no better way of reducing feed bills than by feeding vegetables, which are wholesome and nutritious as well as cheap. Many poultry keepers feed too much grain, for a diet of hard grain is fattening and hard on the liver. Probably most side-line poultrymen could replace half the grain ration with vegetables and half the remainder with sprouted barley and have healthier, brighter, busier hens. In many cases, also, part of the grain ration might be replaced by dry mash, which is cheaper. Half the ration, experts say, may safely be mash.

In selecting the ingredients for the dry mash care must be taken to avoid too much crude fibre or all our efforts may be wasted. Ground oats, ground barley and alfalfa meal all contain a good deal of this fibre, only a small portion of which can be digested. A little helps digestion by making the ration bulky, but too much clogs the digestive organs. A poultryman whose hens were unhealthy and unproductive called in an expert to help him locate the trouble. Examination of the crops revealed that they were crammed with hulls which the poor birds were unable to handle. They were actually starving to death with full hoppers before them.

Efficiency means making the best of what one has or can obtain most cheaply. It does not mean sacrificing eggs or health. It means feeding not too little nor too much, but just enough to keep the hens at the maximum of vigor and production. Many hens are fed too much. Many are fed a ration so rich in carbohydrates that it overtaxes the liver. Many, very many, are denied the liberal ration of green feed which means health and vigor and therefore production. Efficiency eliminates all these leaks. A very good way of reducing the grain ration to just what is needed is to give the hens during the day all the green feed (including sprouted grain) and mash they will consume, and then at night give them a feeding of whole grain that will send them to bed with full crops.

EGG LAYING CONTEST AT STORRS

Storrs, Connecticut, report for thirteenth week ending January 30, 1917:

The end of the thirteenth week of the contest at Storrs found the total production at 22,768 eggs. The number of eggs laid during the week was 2502, or 315 more than they laid during the previous week and 67 eggs less than for the corresponding week last year.

Obed G. Knight's White Wyandottes from Bridgeton, R. I., were first for the week with a yield of 50 eggs. This represents a new high record for the current competition, the previous record being 49 eggs in any one week.

The three best pens in each of the principal varieties are as follows:

Barred Plymouth Rocks

Jules F. Francais, 383; Fairfields Poultry Farms, 350; Rodman Schaff, 247.

White Wyandottes

Merrythought Farm, 393; A. L. Mulloy, 335; Brayman Farm, 303.

Rhode Island Reds

Jacob E. Jansen, 387; Hillview Poultry Farm, 365; Geo. W. Harris, 351.

White Leghorns

A. P. Robinson, 488; Hilltop Poultry Yards, 429; J. O. LeFevre, 411.

Miscellaneous

Koshaw Farm (Buff Rocks), 363; Cloyes & Sullivan (Buff Wyandottes), 337; Obed G. Knight (White Orpingtons), 325.

EGG LAYING CONTEST AT MOUNTAIN GROVE

By C. T. Patterson, Director Missouri Poultry Experiment Station

January report.—The contest made some very unusual records during January. The 290 pullets laid 3982 eggs during the month, which is an average of 13.7 eggs for each pullet. One Buff Orpington pullet laid 28 eggs in December and 30 in January, making a profit of almost $1.50 during the two months.

Many breeds and varieties are making good records, so the prizes and honorable mention are distributed among the many varieties.

The five highest hens to date are: White Wyandottes, Missouri, 81 eggs; R. C. R. I. Whites, New Jersey, 75 eggs; White Wyandottes, Missouri, 71 eggs (tie); S. C. Red, Iowa, 71 eggs (tie); Buckeye, Missouri, 69 eggs (tie); White Rock, Idaho, 69 eggs (tie); White Rock, Idaho, 67 (tie); White Wyandotte, New York, 67 (tie).

The five highest pens for January are: R. C. Rhode Island Whites, New Jersey, 114 eggs; Buff Rocks, Kansas, 108 eggs; Buff Orpingtons, Missouri, 101 eggs; S. C. Buff Leghorns, Michigan, 100 eggs; White Orpingtons, Missouri, 99 eggs.

The ten highest pens to date are: White Wyandottes, Missouri, 304 eggs; R. C. R. I. Whites, New Jersey, 294 eggs; White Wyandottes, New York, 279 eggs; Buff Orpingtons, Missouri, 261 eggs; White Orpingtons, Missouri, 252 eggs; R. C. Reds, Missouri, 247 eggs; R. C. Reds, Missouri, 239 eggs; S. C. W. Leghorns, Missouri, 237 eggs; S. C. Reds, Iowa, 235 eggs; Buff Orpingtons, Missouri, 229 eggs.

TURKEYS

GIANT BRONZE TURKEYS

Let me tell you how to make more money on turkeys. Large turkeys can be raised at practically the same cost as small ones. It is in the strain. By scientific cross-breeding I have developed a strain of turkeys which mature rapidly, and attain unusually large size by holiday time. You can introduce some of this blood into your flock and make money by it the very first year. Gold Nugget strain wins again. At Pacific Coast largest shows, 1916, the California and Arizona State Fairs and San Diego, also the great Los Angeles Show 1917, eleven prizes eleven entries. Stock and eggs from my flock should put you in the Giant Bronze Turkey lead in your locality. Toms for sale, also eggs. Write for circular. Raised on 320-acre farm. Address J. Will Blackman, 607 East Third St., Los Angeles, Cal.

For Sale—Young bronze turkey hens, 6 to 8 lbs., $2 each. E. A. McKinley, R. F. D., Ukiah, Cal.

LUMBER

AAA—Lumber, New and Second-Hand; rough, $10 M; finished, $15; "A" R. W. shingles, 45c bundle. Dan P. Dolan, 1639 Mission St., San Francisco, Cal.

FARM LANDS FOR SALE

No Money in Fruit—Unless you have the right kind of an orchard. I have the right kind: 3¼ acres of Newtowns and Spitzenburgs which yielded 3300 boxes the past two years. The average price received was about $1.25, making over $4000 for the two crops. After deducting all spraying, irrigating, harvesting and marketing expenses there was left nearly $3000 from the proceeds of the two crops. The trees are getting bigger and better all the time and the market has averaged about the same—$1.25—for the past 11 years. Fine place for a cow and chickens, the ground being covered with clover and grasses, which grow luxuriantly. No cultivation needed. Big packing-house, five-room residence, city water, phone, electric lights, etc. This is not a farm, but choice city income property, well located in the finest residence city on the coast; Ashland, Ore., which has a population of 5000 and a great future as a health resort. Price $7500; incumbrance $1000. Reasons for selling are purely personal. Would consider trade for farm or acreage of similar value in low altitude. O. H. Barnhill, Ashland, Ore.

10 Acres, irrigated, 4-room house and barn, chicken houses, 2 miles out, $2000. 30 acres, irrigated, checked, nearly new cottage, 40x52 barn and tankhouse, with concrete floors, other outbuildings, fenced hog tight, $6500. 80 acres, on Highway, 2 miles out, very level, for alfalfa, corn, rice, $10,000. 145 acres, on river front, nothing better anywhere for walnuts, prunes, etc., 55 acres alfalfa, complete dairy, electric light and power, subdivision 1 mile selling at $250. My price $125 per acre. 640 acres, level and rolling, house and barn, finest soil for almonds, lands nearby selling at $75 and $100. My price $30 per acre. 720 acres in foothills, 15 miles from R.R., easy auto and stage road, 150 acres has been plowed, 35 acres alfalfa, 3000 cords of wood in large trees, no brush, 7 room house, barn and other outbuildings, windmill, garden and some fruit. A pretty and very cheap place at $15 per acre. JOHN C. MOGK, Colusa, Cal.

Wanted—Farmers, orchardists, live stock men to use classified liner advertisements like this. Thousands of people read every ad, and the cost is only 3 cents per word per issue, **minimum 35 cents.** Extra lines of white space above and below cost only 16 cents per line.

For Sale—80-acre improved foothill ranch. 12 miles east of Porterville. 30 acres citrus land now in wheat; 15 acres alfalfa land; hog fencing; pasture; timber; river; railroad adjacent. Modern new house (furnished if desired), gas plant, furnace, etc. Five outbuildings; implements; live stock. Nothing delapidated. Ideal place for country life. Sacrifice $25,000. $17,000 will handle. Address New, Box 3, California Cultivator.

Oregon & California Railroad Co. grant lands. Title to same revested in United States by act of congress dated June 9, 1916. Two million three hundred thousand acres to be opened for settlement and sale. Power site, timber and agricultural lands. Containing some of best lands left in United States. Large sectional maps showing lands and description. Price $1.00. GRANT LANDS LOCATING CO., P. O. Box 610, Portland, Oregon.

For Sale—320 acres fine sandy loam soil 5 miles northeast of Modesto, 1½ miles directly south of Riverbank in Modesto Irrigation District, average yearly water cost less than $1 per acre. Land suitable for alfalfa, grapes, deciduous fruits or farm trucking. Will sell as a whole or in 20-acre tracts. Average price $150 per acre. Will make suitable terms to parties buying for improvement. B. F. Kierulff, 757 S. Los Angeles St., Los Angeles.

California Land $1.00 Per Acre Cash, balance 90c per month per acre. Immediate possession given. No taxes, no interest. Level San Joaquin Valley. Only four hours from San Francisco. Five acres up. Clear; ready to plow. Open ditch irrigation $1 acre per annum. Particulars, maps, photos, free. Stevinson Colony, Desk E, 785 Market St., San Francisco.

160 Acres at $55 Per Acre Cash; in Yolo County, 2 miles from Hershey, on the S. P., Arbuckle; sandy loam; no improvements; 2 crops of corn or beans or peas should pay for the land; cash only considered; no exchanges; no agents.

CITRUS TREES

The Wallace Nurseries, office located at 507 I. W. Hellman building, Los Angeles, are receiving orders for citrus and olive trees for this year's planting. This information will be of interest to many buyers who are fearing a material shortage. At the best there is no great quantity of trees to plant this year, but the planter if wise will place an early order and the Wallace people will be glad indeed to give more extended information to all citrus growers.

These tools do the work of 3 to 6 men

One man can cultivate 3 to 6 times the usual acreage with Planet Jr implements. They are so ingeniously designed and scientifically constructed that with greatest ease they do thorough, rapid cultivation. Fully guaranteed.

"I'd rather have my Planet Jr Seeder during the season than an extra man," writes one user.

No. 25 Planet Jr Combined Hill and Drill Seeder, Double and Single Wheel Hoe, Cultivator and Plow will work two acres of ground a day. It is a great tool for the family garden, onion grower, or large-scale gardener. Is a perfect seeder and combined double and single wheel hoe. Unbreakable steel frame.

We carry stock in Los Angeles. Agencies in all principal Pacific Coast cities.

New 72-page Catalog, free!
Illustrates Planet Jrs in action and describes over 70 tools, including Seeders, Wheel Hoes, Horse-Hoes, Harrows, Orchard- and Beet-Cultivators. *Write for it today!*

Planet Jr

No. 17 Planet Jr is the highest type of single-wheel hoe made. Its light durable construction enables a man, woman, or boy to do the cultivation in a garden in the easiest, quickest and best way. We make 32 other styles of wheel hoes and seed drills —various prices.

Household Department

TO ONE DEAD

I think that if you suddenly returned,
A little bewildered by the light and air,
But smiling secretly at all you learned,
Shaking the grave-dust from your shining hair—
I think if I should come with you to tea,
I should not find you changed or grave or sad,
But keen with talk of what there was to see,
Laughing the while in that frank way you had.
There would be stories of the shadowy host,
And sprightly comment on the things they do;
How this one was a most exclusive ghost,
Or that one was adorable in blue.
It would be good to hear the things you said—
Your light and usual gossip—of the dead.—Century.

MEMORY AND A DRESS

"I HAVE really come on an errand," said Mrs. Cobb.

Jessie Stubbs caught her breath. She had begun to believe that her neighbor had actually come to call. It seemed, however, she had been mistaken.

"You know," went on Mrs. Cobb, "that we're getting up our play, 'The New Minister,' and tomorrow night is dress rehearsal. I can't find a thing that is suitable for me to wear. The costumes are all going to be old-fashioned, and I hate to have anything made up on purpose. I thought maybe you'd have something that would answer, Mrs. Stubbs."

Jessie Stubbs sat very quietly, considering. Pink spots had come out in her faded cheeks. "Yes, I have something," she said, at last, slowly.

"There!" cried Mrs. Cobb. "I knew you'd have. Do get it and let me see it."

Jessie Stubbs went into her bedroom, which was off the sitting room. She paused before the quaint bureau and opened a drawer. A scent of dried heliotrope came out. She lifted a sheet of tissue paper and took out a flowered silk dress made with a tight, plain waist and a full skirt. She laid the dress down tenderly and, going to the closet, brought forth a huge hat box, from which she drew a shaker bonnet. Laden with dress and bonnet, she returned to the sitting room.

Mrs. Cobb gave a scream of joy "Lovely! The very think I wanted!" she cried. "I'll take 'em right home and try 'em on, Mrs. Stubbs."

After she had gone Jessie Stubbs sat down in her chair and studied the stripes in the rag carpet. The pink spots had faded from her delicate old face. "I'm a fool," she said to herself. "I'd no busines to let that woman have my things. She won't take care of them, I know. But I had a longing to have 'em seen—to let folks here know I once used to wear silk if I do now go in calico. I'd like to have been in that play myself," she sighed, "but I knew, of course, they wouldn't ask me. However, my dress will be there."

All day long Jessie Stubbs wove rags of silk, cotton, or woolen into carpets, rugs, and curtains for the townspeople. Sometimes she earned as much as a dollar a day. This kept her in food and paid the rent of the remote, tumble down old house. She had nothing else to depend upon.

As she sat weaving her thoughts dwelt upon the flowered silk dress. It was the one tangible thing remaining from her past. When her husband died and his people had manifested only too clearly that they regarded her as an incumbrance she had come back to Fairview and taken up carpet weaving.

When the church which she attended had first begun to talk about producing the play called "The New Minister," she felt a curious longing to be included in the cast. She who was never seen save in faded black-and-white calico or a shabby black serge wished foolishly to blossom forth in flowered silk for one time more in her life. But the opportunity had not been given her. And now she had handed the flowered silk out to Mrs. Cobb! There was some satisfaction in the thought that the beautiful dress would be admired and cause wonder among those who had not dreamed she owned such array. There was fear also lest it be carelessly used.

She was busily weaving next morning when there came a knock at the door. She opened the door and instead of having to look far up into the face of the customer she expected she had to look far down into the face of a small girl who was laden with a large parcel.

"Mamma sent your dress back," she said. "She's sick and can't wear it. She's got the grip. She said for you to wear it and go in her place, 'cause —'cause—" She swung from side to side trying to recall all she had been told—" 'cause it'll break things up if you don't. And in there," she pointed to the parcel, "is something you're to learn. That's all."

She gave Jessie a bright smile and darted away.

With trembling fingers Jesie undid the parcel and shook out the delicate, shimmering folds. From them fell a paper. It contained the little speech she was to learn.

"My land, my land!" she thought, and her heart fluttered. "I wonder if I can do it. I wonder if I know enough."

Now that opportunity had come she feared to grasp it. But when Mrs. Grant, whom Mrs. Cobb sent, came to help her dress and tell her what she must do and guide her to the rehearsal, she began to feel that she was going to have a very good time indeed.

Her unexpected appearance occasioned astonishment. But everybody treated her so well she was stimulated to do her utmost. The flowered silk dress encouraged her. She seemed to be back again in her happy carefree young girlhood, the idol of her parents and the life of her circle. A smile came to her lips and eyes, her

For style and comfort wear

F. Mayer Boot & Shoe Co.
Milwaukee, Wis.

heart lightened. Every movement showed her happiness. Those who beheld her could scarcely believe that this radiant little figure was the old woman who toiled dully, passionately at the loom all day long.

When the rehearsal was over a man who had watched her a good deal came up to her. "I've been trying to make out who you are and where I'd known you," he said. "About 40 years ago I saw this same dress, or one just like it. I remember, because I thought it was the prettiest dress I had ever seen. And I thought, too, the girl who wore it was the prettiest girl I had ever seen. I danced with her four times. Her name was Jessie Lindon." It was a moment before she could speak.

"I was Jessie Lindon. And that night I danced with you, John Bruce, was the last time I ever danced with anybody. I was married a few weeks later and my husband did not permit such follies. And this is the very dress I wore. I am pleased to see you again." She dropped him a low courtesy. He returned it with a deep bow.

After that dress rehearsal it was noticed that the Widow Stubbs got a great deal of attention from John Bruce, the widower who kept the grocery store on Main street and had a nice little house in the upper part of town. It was no surprise to anybody, therefore, when the two were married. The bride's wedding dres was of flowered silk, which, in spite of careful remodelling, had a curiously old-fashioned look. Upon her breast she wore a spray of heliotrope.—Fresno Republican.

TEPARY BEANS

Tepary beans, recently introduced from Arizona where they have long been known by the Indians as heavy yielders on dry lands, have been quite extensively raised in California this year and are bringing good prices. Now that they are becoming so well known and a feature on the market the following recipe of Mrs. C. J. Wood of the experiment station farm, near Mesa, Arizona, is given. She has had excellent success in cooking tepary beans, according to the following procedure, which is her own:

Wash two cups of Tepary beans and put them to soak in one quart of lukewarm water in a graniteware or other suitable cooking vessel. Set the vessel on the back of the stove, where the water will keep warm, for two hours. Then drain off this water and add one quart of fresh water of the same temperature. Add three tablespoonsful of fresh butter or a piece of salt pork three inches square and boil for two hours. Take care not to burn the beans in cooking, stirring frequently to keep them from sticking to the bottom of the vessel. Add a teaspoonful of table salt when the beans are about done, and a tablespoonful of honey if it is available.

If the water is very hard a pinch of baking soda should be added to soften it.

Cooked in the manner described above Tepary beans are delicious, having a peculiar and very desirable flavor of their own and being preferred by those who become accustomed to them.

In addition the following recipes are given by C. R. Fillerup, farm adviser of Navajo-Apache Counties:

Baked Tepary Beans.—One quart tepary beans, one-fourth teaspoon soda, one tablespoon butter, one cup of tomatoes, one teaspoon mustard, one tablespoon molasses, pepper, salt. Look beans over carefully. Put into a kettle with enough water to cover. Add soda and boil five minutes, then drain soda water off and cover with cold water. Boil until tender, then add tomatoes, butter, pepper, salt and boil 30 minutes. Put into baking pan, well mixed with mustard and molasses. Bake in moderate oven two hours. Serve hot, or cold with meat.

Baked Tepary Beans.—One quart beans, one-fourth teaspoon soda, one tablespoon butter, one cup tomatoes, two medium chilis, half pound cheese, pepper, salt. Look beans over carefully, put into a kettle with enough water to cover. Add soda and boil five minutes, then drain soda water off and cover with cold water. Boil until tender, then add tomatoes, butter,

Let The World's Largest Water Developers Solve Your Pumping Problems

chili, pepper, salt and boil five hours. Put into baking dish in alternate layers of beans and grated cheese and drop bits of butter on top. Bake 30 minutes in moderate oven, and serve hot in the same dish.

Tepary Bean Soup.—One pint beans, pinch of soda, two pounds ham or fat beef, one cup tomatoes, one onion, pepper and salt, one-fourth pound macaroni. Look beans over carefully, soak over night, drain. Boil in soda water five minutes, then drain. Add two quarts of water, tomatoes, onion, meat, salt, pepper. Boil six hours, remove the meat. Mash well and strain. Boil in separate dish one-fourth pound macaroni. Add macaroni to soup. Serve hot with meat and pickles.

PERSIMMON PUDDING

Part 1—One pint sugar, one pint of ripe persimmons mashed through sieve, one pint milk, one pint flour, two eggs and two crackers, one scant teaspoon soda, one teaspoon baking powder, half teaspoon cloves, one teaspoon cinnamon. Bake in slow oven from three quarters to one hour.

Part 2—One cup water, half cup sugar, one lemon, yolk one egg, one tablespoon flour, whites of two eggs whipped. Cook on top of stove and pour over part one when cooked. Serve with whipped cream. Very rich and on the order of plum pudding.

Legal Queries

Louis B. Stanton, attorney, 243 Wilcox Building, Los Angeles, will answer legal queries in this department.

Immediate mail replies cannot be given except where fee to Mr. Stanton is paid. When replies are wished in Cultivator address query to 115½ N. Broadway, Los Angeles.

Unsigned communications receive no attention.

Taxes on Claim

Can the county collect taxes for improvements on a desert claim? I have not made my final proof. What will be the penalty if I do not pay them?—Subscriber, Inyo-Kern.

The exemption of public property from taxation does not extend to improvements on the public lands made by pre-emptioners, homestead or other claimants or occupants at their own expense, and these are taxable by the state. Of course it is frequently true that the assessor overlooks improvements and perhaps sometimes does not deem that they are of sufficient value to include in the tax roll, but unless the taxes levied against these improvements are paid, the tax collector may bring suit and seize them for the payment of the taxes and penalties.

Wife's Property

A woman owns piano and other valuables belonging to her before marriage. She has a child by a former marriage. Can she give her belongings to whom she wishes? Can her husband legally claim a part?

All property of the wife owned by her before the marriage and that she acquired afterwards by gift, bequest, devise, or descent, with the rents, issues and profits thereof is her separate property. The wife may, without consent of her husband, convey her separate property.

Wife's Share of Estate

What is wife's share of estate in California? No children, but husband has half brothers and sister.—Subscriber.

If decedent leaves surviving husband or wife and no issue the estate goes, one-half to the surviving wife and the other half to the decedent's father and mother in equal shares, and if either is dead the whole of said half goes to the other. If there is no father or mother, then one-half goes in equal shares to the brothers and sisters of decedent. The above applies to the separate property of the husband. In case property is community property, the wife upon the death of the husband is entitled to one-half of the community property, and then the first mentioned division applies to the other one-half. The husband is entitled to devise all of the property, however, to the wife by will duly executed.

Pull Big Stumps by hand

Showing easy lever operation

Clear your stump land cheaply—no digging, no expense for teams and power. One man with a K can rip out any stump that can be pulled with the best inch steel cable. Works by leverage—same principle as a jack. 100 pounds pull on the lever gives a 48-ton pull on the stump. Made of Krupp steel—guaranteed against breakage. Endorsed by U. S. Government experts.

HAY

Scott, Magner & Miller say under date of February 10:

Receipts past week 1806 tons, last week 1361 tons. Market conditions are about the same. Hay has been moved from tracks without difficulty and increased receipts have been taken care of without reduction in price. Trade throughout the city is very quiet. Some hay is moving for export. Demand for alfalfa hay has been good throughout the country districts.

Citrus Fruit Market

LOS ANGELES ,Feb. 14, 1917.

Lower grade stuff is suffering and unfortunately there is considerable such fruit going forward. Shipments are ranging from 100 to 160 cars per day. Strictly first class fruit has been commanding fair prices, even higher than last week.

Lemons are selling well.

Shipments

Shipments of oranges from Southern California since November 1, 1917, 6708 cars, lemons 1462, total 8170; to same date last season, oranges 6130, lemons 1571, total 7701. From Central California to date this season, oranges 4008, lemons 149, total 4157; to same date last season, oranges 4163, lemons 127, total 4290. From Northern California to date this season, oranges 842; last season 609.

FROM THE AUCTION

February 9

New York: Ten cars navels, 2 lemons. Navels, $2.60@3.85; lemons, $2.85@3.30.

Boston: Six cars. Navels, $2.60@3.55; lemons, $3.40@3.85.

St. Louis: Seven cars. Navels, $2.35@2.90; lemons, $2.50@3.20.

Pittsburg: Navels $1.65@2.85; lemons, $1.15@3.25.

Cleveland: Four cars. Navels, $1.85@3.45.

February 12

Boston: Fifteen cars. Navels, $1.50@3.45; lemons, $2.30@3.85.

February 13

New York: Twenty-two navels, 3 lemons, lower on poor grades. Navels, $1.80@3.95; tangerine halves, $2.00; lemons, $2.70@3.20.

Boston: Five cars. Navels, $1.90@2.65.

EGGS BY PARCEL POST

The Wallace egg carrier is the latest for eggs and for parcel post deliveries. It makes an exceptionally attractive package, is light, is firm, and will carry eggs safely to any distance. A sample of one of these cases is at the Cultivator office and we do not see how a more satisfactory carrier could be provided. It has been in practical use for over two years and every egg shipper who has used it is free in praise of its advantages.

It may even be used as a hamper, that is, a portion of the case given up to eggs and the remainder to other high grade farm products. Write the Wallace Egg Carrier Company, 451 Third Street, San Francisco.

EVEN TO THE SCREW HOOK

"Better Farm Implements and How to Use Them", is the latest publication of the John Deere Company. We would suggest that every reader of the Cultivator who uses a plow, cultivator, drill or almost any other farm implement should write to John Deere Company, Moline, Illinois, and ask how a copy of this manual of farm implements may be had. It is a book of nearly 160 pages with innumerable illustrations and descriptions of farm implements, how to use and care for them and get the most out of them, and, best of all, it has a strong cord with which it may be suspended and a little steel screw hook with which to support it on some convenient corner of the desk.

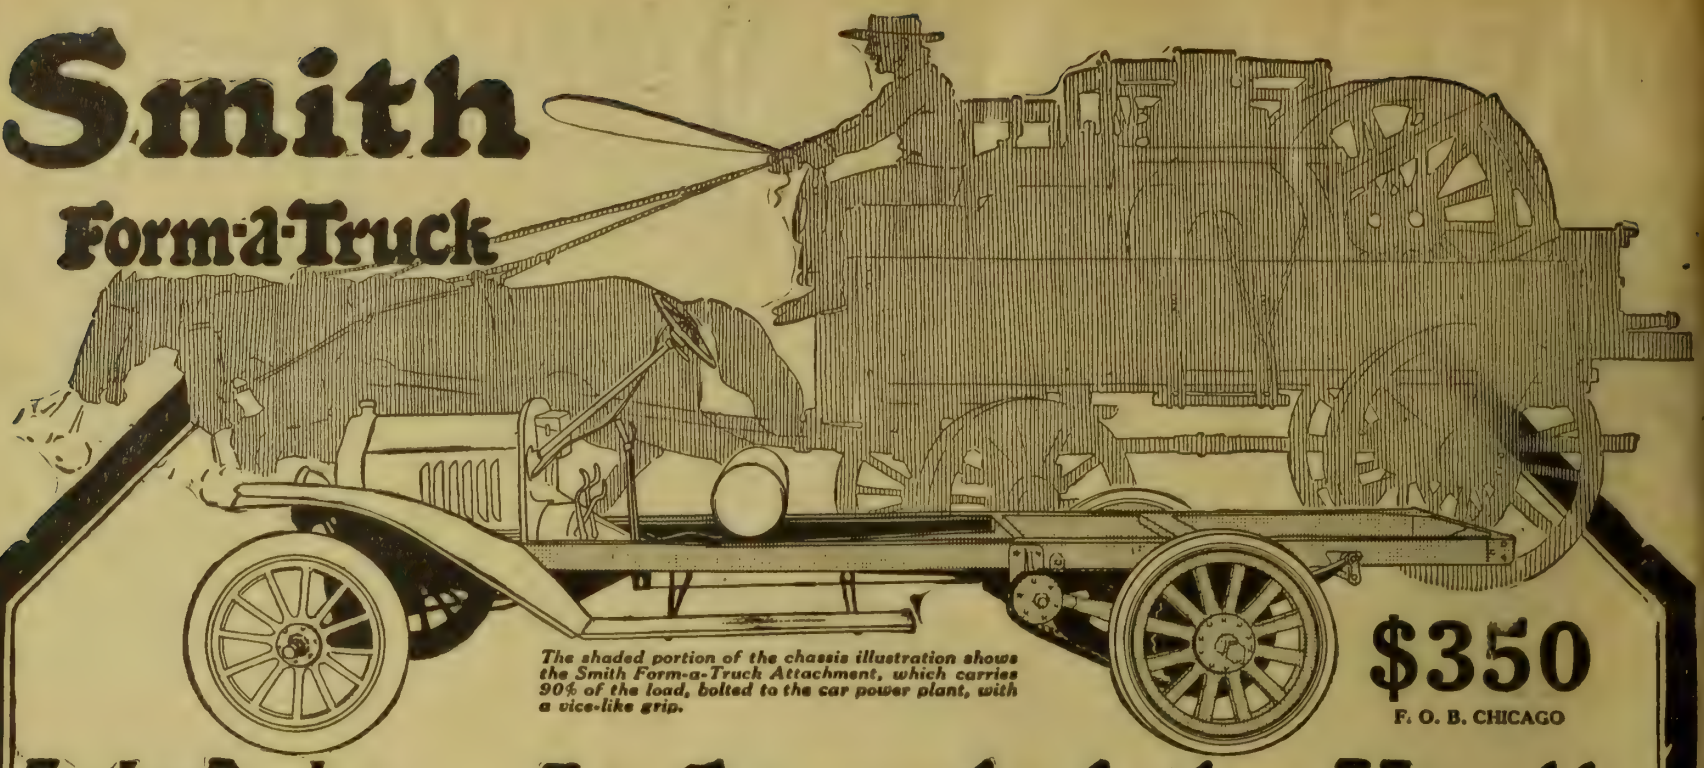
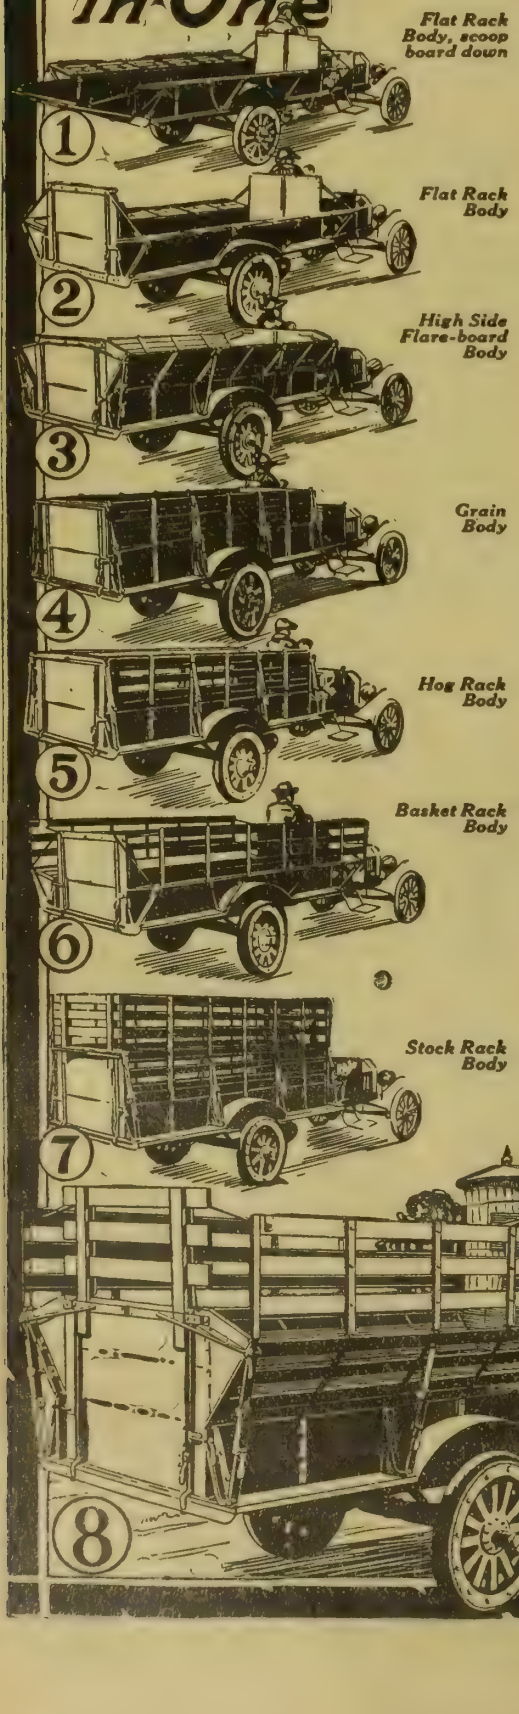
Smith Form-a-Truck



The shaded portion of the chassis illustration shows the Smith Form-a-Truck Attachment, which carries 90% of the load, bolted to the car power plant, with a vice-like grip.

$350
F. O. B. CHICAGO

Eight Bodies in One



It Sounded the Knell of Horses in all Farm Hauling

HUNDREDS upon hundreds of up-to-date farmers, who figure time in dollars and cents, have made tremendous savings with Smith Form-a-Truck. It is taking the place of horses for hauling milk and farm products to town. It is doing heavy service work of all kinds about the farm.

With their Smith Form-a-Trucks they are carrying loads that are impossible for horses—*twice* the load of any team. And they are doing the work in *half* the time. Think what this means in time and money.

Idle Horses Cost Money—Idle Trucks Cost Nothing

Agricultural experts state that farm horses work but 1000 hours a year—100 days of 10 hours each. Over *two-thirds* of the year they are eating their heads off. They need stabling They need veterinary attention. They need the attention of your hired help. And you get 100 days work for this 365 days of expense and attention. Think of it.

Your Form-a-Truck costs you nothing when it is idle. It requires feed (gasoline) *only when it is working.* So you save the expense of horses during 265 days of idleness. And it does your work far cheaper than horses.

Yet this remarkably efficient, money saving Smith Form-a-Truck which does the work of *two* teams at *half* the expense costs no more than a *single* team. Think of it!

You are replacing old fashioned farming methods with modern labor-saving, time-saving machinery in other branches of your farm work. The time has now come to discard the old-fashioned expensive methods of hauling. Put a Smith Form-a-Truck on your farm now.

The Smith Form-a-Truck combines with any Ford, Maxwell, Dodge, Buick, or Overland Car, to make a fully guaranteed one-ton truck. 9,652 users in every line of business in the country are now saving money with the Smith Form-a-Truck. Hundreds upon hundreds of farmers have made tremendous savings. You, too, can do what these farmers have done.

The Famous Eight-in-One Farm Body

Every possible use for a truck on the farm is covered in the new collapsible farm body—an exclusive feature of Smith Form-a-Truck. Pull the lever and you get any one of eight combinations of farm bodies—Stock Rack body—Hay Rack—Basket Rack—Hog Rack—Grain—Flat Rack—High Flare board—flet back—swoop board down. Change from one type to another in an instant—without a single tool.

Send for Free Book

Send for our big illustrated farm booklet. It will show you just how you can begin to put money in the bank that you have hitherto been putting into feed for horses.

Get your copy of "Deliver the Goods" a booklet crammed with valuable trucking information.

LOS ANGELES February 24, 1917 SAN FRANCISCO

The Imperial Assembly

Enthusiastic Meeting of County Farm Bureaus. Most Instructive Addresses Made

ONE of the strongest factors for the advancement of the Imperial Valley is its farm bureau, and next to the activities of the adviser its most helpful feature is the farm "center" which holds monthly meetings attended by the farm adviser and often by others who bring inspiration and information for those who are developing that strange and wonderfully rich section. Then annually there is held the assembly. Last year's assembly at Brawley brought into the valley some of the best talent of the state university, and several meetings were held simultaneously. It was a complete success. This year it was determined to center the enthusiasm into one meeting and one day's session. One of the largest assembly halls in the valley was secured, that of the Imperial high school, and the people of Imperial extended invitation to all to come and eat of Imperial's good things, and they did entertain the crowd most royally. The most interesting moment of that entertainment is shown in one of the photographs on this page. The "bread line" looked as if there were thousands, though only a few show in the photograph. In fact, there were hundreds, but when all had finished eating there were still luscious morsels left in the barbecue pits and abundance to feed other hundreds.

The auditorium of the high school, photograph of which is also given on this page, was admirably adapted to such a meeting, excepting that it proved inadequate to hold the hundreds that attended. We have never seen a state convention more enthusiastic or displaying more genuine interest than was shown at this annual assembly. When it came to the endorsement of the two and a half million bond issue which will soon be voted upon to strengthen and improve the valley's irrigating system there was no dissenting vote. The matter was presented to the assembly by Consulting Engineer G. E. Anderson, and while the intense interest in the effort was such that many questions were put to Mr. Anderson, they were answered in such spirit and with such clearness that entire satisfaction was manifested.

Imperial Union High School
Attendants at the second annual farm bureau gathering

Director R. H. Forbes of the Arizona state university presented the matter of date culture, showing some of the problems confronting date culturists in his state and commenting on conditions as they obtained in the Imperial and Coachella Valleys. He said that the culture of dates had not yet reached a stage where it could be called an industry. However, cultural experiments are being made in such a large way that within a short time it is hoped it may be put upon an economic basis, which will mean the addition of much wealth to the state.

One of the principal features of the present work is the growing of seedling dates. Until recently it has not been possible to secure from suckers more than five or at least ten per cent of live palms. With propagating house methods this per cent is being increased. Meantime the seedlings are developing and even giving so much fruit at three or four years of age as to show the character of the tree.

In his state practically all of the most desirable dates have to be ripened; there has been much difficulty with fungous diseases attacking the fruit if allowed to ripen on the tree. Most interesting was the exhibit of a five pound crate of fresh dates ripened artificially five months ago and kept in cold storage. At this period of the year he said these dates could be shipped into any Eastern market.

Considerable interest was manifested in the debate: Resolved, that live stock is more profitable to Imperial Valley than cotton. Messrs. Robinson and Simon took the affirmative and Messrs. Wilsie and Conkling the negative. The judges ruled that the affirmative produced the best arguments, but, as Director Forbes said afterward, it was a most useless discussion, for in his estimation it was not a case of live stock or cotton, but if Imperial looked to her welfare it would be live stock and cotton and in addition many other crops which were succeeding there and adding to the security of the farmer who practices intelligent diversification.

Farm Adviser Paul I. Dougherty told of some of the things a farm adviser can do and gave a bit of the history of the farm bureau of the Imperial Valley. He said that its accomplishments seemed much like the growth of a tree; at the end of a year it was larger but its growth was not so visible. The average attendance at the farm bureau centers has been 61 per meeting. Amongst the activities of the farm bureau during the past year, in addition to the farm assemblies, has been a cotton conference, grasshopper campaign, organization and encouragement of pig clubs, pig club show at which bronze medals were distributed, establish-

California Cultivator

Vol. XLVIII No. 8 LOS ANGELES: February 24, 1917 One Dollar Yearly

Sale at Berkshire Congress

A Great Event in Berkshire Circles. Valuable Discussions Precede Sale of Lively Bidding

Written for California Cultivator
By W. S. Guilford

"ALMOST unusual and highly successful event". This was the concensus of opinion regarding the third annual meeting of the Western Berkshire Congress held at the university farm at Davis, February 13, 14, 15, 1917.

There were judging contests taken part in by breeders, ladies and students, a motion picture show of a hog cholera serum plant, a trip over the farm, a real "pig" banquet and love feast and a sale in which the animals sold averaged $145 per head.

Berkshire enthusiasts were present from Hawaii, Illinois, Oregon and all over California.

The faculty and students of the university farm, including Dean Hunt, Dean Van Norman, Professors True, Thompson, Woll, Voorhies, Miller and Royce, Herdsman Jack Findley and a splendid lot of students, won the hearty commendation of the Western Berkshire Congress officers, members and visitors, for the whole hearted hospitality accorded to all.

Officers of the Western Berkshire Congress were elected for 1917 as follows: F. R. Steel, Grants Pass, Oregon, president; C. M. Talmadge, Newport, Washington, vice president; Arlington

Grafting---Do It Now

Geo. C. Roeding Revises Points on Grafting of Olives, Walnuts and Figs

IT is a comparatively easy matter to work over unprofitable trees and vines into better varieties. With old trees lacking activity of growth and consequent productivity, working over increases their vigor and adds to their longevity, and at the same time makes them very profitable in almost all cases.

Methods

There are two methods which will answer for all practical purposes; one the cleft or wedge, and the other, the bark graft and which has been found very satisfactory for figs and all varieties of evergreen trees.

Cutting Scions

Just at this time the most important step is to cut the scions. The sooner this is done the better, for they should be taken when in the most dormant period. The scions should caliper not less than one-quarter inch and up to one-half inch, and the wood should be thrifty and of the current year's growth, except in the case of figs and walnuts, when the two-year-old growth, unless the one-year wood is hardened and without much pith, is always preferable. No matter for what purpose scions are cut they should be heeled in in damp sand on the north side of a building, having the butt end buried about six inches. Never bury the stick entirely, as just as soon as the warm weather sets in in the spring the buds will swell, which is a decided objection.

The Operation

Our experience has been that with figs, olives and oranges the bark method of grafting is the safest and best, while with all other deciduous trees both methods may be employed to equal advantage. The benefit to be derived by following this plan, particularly when a large number of deciduous trees is to be worked over, is that the cleft graft may start in the latter part of January or the early part of February while the trees are still dormant. The bark method must be deferred until March or April or as soon as the sap commences to flow freely. Never forget one point, and that is that it is of the utmost importance to cover over with a new tissue the stump which has been cut off and grafted. Where only one scion knits the cambium layer is so slow in developing that a dry rot often sets in in the sap wood, causing a weak union of the graft with the subject, and in cases of high winds the graft often blows off. This happens quite frequently in

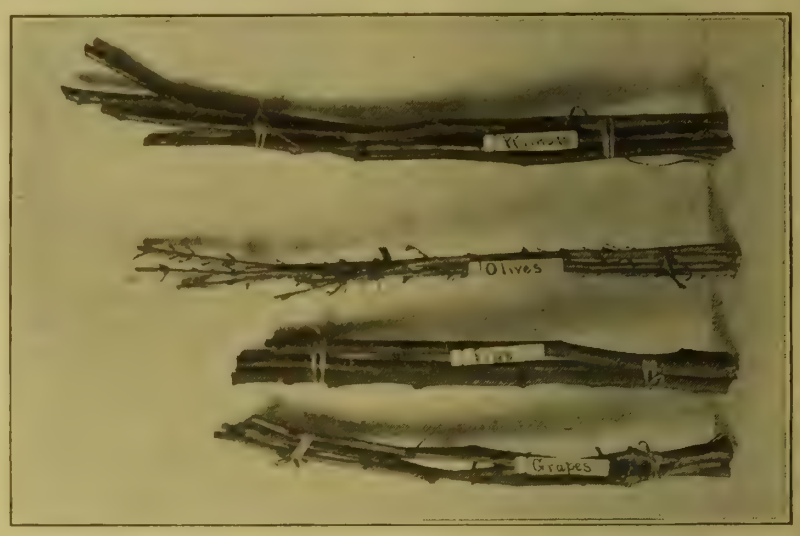
working over large stumps from eight to 12 inches in diameter, and it is for this reason that our preference is for the bark grafting in handling such subjects. In cleft grafting it is practically impossible to place more than four scions in a stump, and in a heavy branch unless care is taken to drive wedges into the cleft to remove the pressure on the scion, the cambium layer will be crushed and the scion fail to grow. On a large stump the advantage of the bark method is apparent at a glance. The scions may be set two inches apart. If a few of them fail to take there are always enough remaining which do start to cause a rapid development of the cambium layer and a quick healing over of the stump. Never cut out any of the scions until the stump is almost completely covered with new wood. It is always a comparatively easy matter to remove the interfering branches in after years when the union is complete, but it is entirely out of the question to get any new scions to take the following year on the same stump where a poor stand has been obtained. We have repeatedly had our attention called to statements made by writers on the subject of grafting, in which they recommend, where all the scions grew all but one should be cut out. No man with any practical experience in this work would make such a recommendation. The usual practice of splitting the stump we have improved upon by making a vertical incision in the stump with a saw and then cutting out a section on the side of the stump to which the scion is to be fitted. This method of procedure requires more painstaking work and more time, but it has a distinct advantage in that there is no danger of crushing the cambium layer in the scion, as is often the case in large stumps unless they are properly wedged. Further than this the split made by the chisel has a tendency to split wider open when the warm weather sets in, and it also takes a longer time for the wound to heal over. In cutting a scion, and particularly where considerable pith is encountered, be sure to make the cut on one side of the scion heavier than the other so that the pith will be surrounded by hard wood on all sides, thus avoiding the splitting of the scion when forced into place. After the grafts are set be sure to wind heavy

Grafting the Olive

An olive stump showing method of lifting bark for inserting scion, with scion cut for insertion. Other stump showing three scions set and tied ready for wax. Note twig buds on scions. These should be obtained if possible. Scions one-fourth to three-eighths inch in diameter.



Types of Scions Recommended to be Used for Grafting.

twine around the stump to hold them in position, and in large stumps of 12 inches or more use a single strand rope. The untarred lath yarn is the best for this purpose. Give this a heavy coating of grafting wax.

To Make Grafting Wax

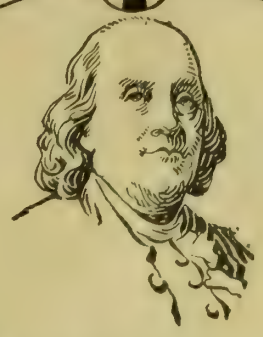
This should be melted in a pot until it is of the consistency of thick paint which should be put on with a brush made of rope unraveled and tied to a stick. Do not fail to wax the tip ends of the scions and to give the surface of the stump a heavy coating. It often happens when the growing season commences that the excess of sap will cause the wax to split and crumble, permitting air to penetrate. Whenever this occurs remove the old wax and repeat the first operation. The best results have been secured by using a wax made of one pound beeswax, three pounds resin and three ounces raw linseed oil by weight. Place the beeswax and resin in a kettle and cook until thoroughly dissolved. Add the oil and allow the ingredients to cook slowly for ten or 15 minutes longer. Remove from the fire and as soon as the wax has cooled somewhat pour a small quantity into a bucket of lukewarm water. Grease the hands and take the congealed mass and knead and pull it until it becomes very tough; wrap in oiled paper and it is ready for use. By preparing the wax beforehand the ingredients are mixed in proper proportions, which is not easy to do when you have a large amount of work to do in the field. This wax is far superior to wax which has not been pulled. It is entirely practical in grafting over large trees to use asphalt in the following proportions: six pounds of asphalt to one and a half pounds of resin. The two ingredients should be melted together in a pot and applied with a brush. Be careful not to have the asphalt too hot; otherwise it will burn the bark of the scion as well as the bark of the subject to be grafted, causing them to die.

After Care

As soon as the grafts have knitted well, and this usually occurs by July 1, be sure to make incisions into the waxed string binding the scions to permit of their expansion and to admit air. Under no condition overlook this point. If you do the bark will be smothered and turn black and it will take several years for nature to provide new bark and overcome your negligence. Do not remove the wax on the stump proper. The natural tendency of grafts after they once commence to grow is to make a heavy upright growth. This growth must be held in check by pinching, and this must be done a number of times during the summer months, and must be followed by reasonable thinning (but do not remove any of the original scions) and severe shortening in of the branches for several years in the winter months. This causes them to grow stocky, creates elbows which act as braces, and promotes a vigorous growth of the cambium layer over the stump. After three years this work need not be so severe, and a reasonable crop of fruit may be expected.

Cutting Tops

Years of experience in this work have demonstrated the advisability of not cutting the subjects to be grafted too close to the point of divergence from the main body of the tree. Cut the branches to be worked over to within five feet of the main body with ordinary fruit trees, but in the large walnuts do not cut back any more than you absolutely have to. Whenever it is practicable do not have the stumps to be worked over more than four inches in diameter. Always in grafting fruit trees leave from one to two branches in the center of the tree, shortening in the tops slightly. These are left to take care of the excess of sap and to shade as far as possible the branches that have been grafted to prevent sunburn. In the coast countries fig trees, and other trees as well, can have their entire tops removed and still withstand the shock, the scions taking readily if properly inserted, but in the interior valleys where the atmosphere is dry and warm to remove the entire top of a fig tree close to the main body would result in the loss of the tree, a fact which has been fully demonstrated by actual experience. The two branches which have been allowed to



"A Word to the Wise is Enough"

Beny Franklin

AND when you're buying tires follow Poor Richard's advice and say only the one word, "Firestone." This word is not only the name of a tire foremost in quality, it is the name of a man who is personally responsible for that quality, which means safety, comfort, mileage, for you.

The vital strength of Firestone Tires makes them oppose equally the tug of rough roads or the test of friction when you "let her out" on smooth stretches.

The Firestone Non-Skid Tread means extra rubber. Those angled letters not only hold the car true in slippery going and protect against skid, but there's "comfort value" in the added rubber piled onto the regular tread.

And because volume of sales (over 33,000,000 dollars last year) and efficient factory methods lower production cost, you get Firestone Tires at only average price.

Your dealer can supply you promptly. See him today.

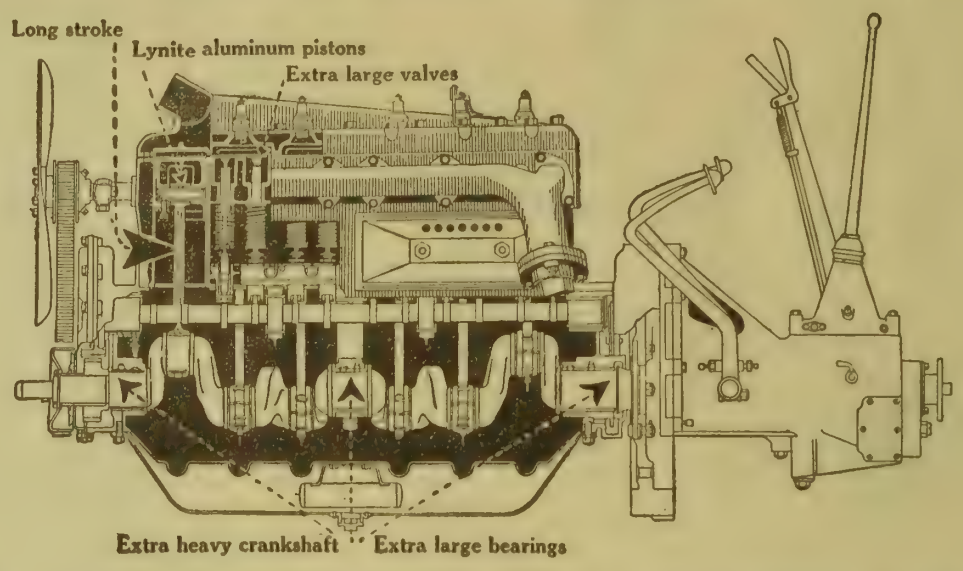
5-PASSENGER 6-30 CHALMERS, $1090
AFTER MARCH 1st, $1250



A SOUND ENGINE IN A SOUND CAR

The engine of the Chalmers 6-30 is very rugged. Yet simple. Modern in everything, but not extreme in any. A good, safe engine. Reliable. Well lubricated. Of good bearings. Accessible. And one that "stays put." Has plenty of power. Though it is not a big engine. The power is well proportioned to the weight of the car. Thus making hills easy going. The power is smooth, too.

Specifications

Engine—6 cylinders, bore 3¼ ins., stroke 4½ ins., piston displacement 224 cu. ins. Power—45 h.p. (on the brake test.) Starter—Westinghouse 2 unit. Carburetor—Stromberg, horizontal, hot air heated. Clutch—Dry disc, asbestos on steel. Fuel feed—Stewart-Warner vacuum system. Ignition—Remy distributor, Willard 80 ampere hour battery. Tires—32 x 4, chain tread on rear. Wheelbase—115 ins.

ARNOTT & CO., Inc., 112-18 South Los Angeles St., Los Angeles

remain can be sawed off entirely the following season, or they can be in turn grafted if the scions of the year before have not taken well or if you have not sufficient branches from your preceding season's grafting to form a good head on the trees. After having sawed off the branches the stumps or subjects to be worked on should have the tops neatly smoothed over with a sharp knife so as to leave a clean, smooth surface, particularly along the edge. The outline of the scion is cut into the stock so that when the bark is removed the scion fits closely into the groove made for it.

Select a scion of the proper size, making a sloping cut along the lower end as long or somewhat longer than the incision on the stock. The scions should be cut the same as for a whip graft except that the cut is all on one side and should have a little more bevel, and the second cut for the tongue of the whip graft should be omitted. The scion should be of such a size that it fits snugly into the open-

Walnut Grafts

The first year growth. Next winter the stump will be completely covered over and the union will be perfect.

ing in the stock so that the bark on both sides of the scion touches the bark of the stock.

Grafting Olives

In olive grafting the method followed is to make an incision from the top of the stump down, just as would be done in setting a bud, and slip the scion into this incision. In following this method the wedge should extend farther up on the scion and should not be as abrupt as the cut on the scions for either fig or walnut grafting.

In selecting olive scions, as far as possible have the little twig buds on each scion, as these very rarely fail to start out while sometimes the ordinary buds do.

Walnut and fig scions should never be less than three-eighths of an inch in diameter, and always avoid very pithy wood. Olive scions should be not less than one-quarter inch in diameter.

The accompanying illustrations tend to make the descriptions very clear of the V-shaped or, perhaps more correctly, U-shaped cut in the bark of the fig stock carried down to the alburnum or sap wood, and the scion with its proper oblique cut, even and smooth, so that it plants itself evenly on the bared sap wood and is held firmly against it by the wrapping of cotton twine.

Grafting Grape Vines

For field work the only practical method is the cleft graft. Dig the soil away from the vine and cut the entire top off down to a point where the roots commence to branch out. With resistant stock this plan should be modified by grafting slightly above the surface of the soil and the soil heaped around the scion temporarily until it has knitted, when it may be removed. One of the most frequent causes of failure in field grafting the

grape is caused by the workmen endeavoring to cross the cambium layer of the scion with the outer or false bark of the vine instead of the true bark. The outer bark strips off readily, exposing the true bark which is of a flesh-reddish cast. In setting grape scions, split the subject with a heavy knife or grafting tool, and on large stock place at least four scions, making two incisions into the stock away from the center. Try and secure wood at least three-eighths of an inch in caliper and if possible with the nodes close together. Cut your scion as directed for a cleft grafting and have from four to eight inches long. The length is dependent on how far the stock is cut off below the surface of the ground. After the scion is cut the earth should be well firmed around it and hilled up, leaving one eye above the ground. If it is possible to irrigate, by all means do so, as this settles the earth far better than it can be done by hand. Never use grafting wax or any other material in working over grape vines, as it is unnecessary. In addition to this any material which will cause the sap to be held in check is more than likely to cause souring and will kill the scion. Severe pinching of the new growth during the summer months should be closely followed.

NO NAME

Written for California Cultivator

THE Peach Growers' Association is after a name for "peeled peaches" which are not peeled. We take it that this fruit is given a lye treatment and peel removed in pure water, but the department of agriculture has made a ruling that these "peeled peaches" are unpeeled and refuses to permit their marketing under that trade name. To most of us this seems an unfair ruling, though strictly technically it is possible that all the peeling is not removed in the process used, but certainly all the objectionable matter is taken from the peach. Therefore the Peach Growers' Association is seeking a name. "The problem," as Editor Rowell of the Fresno Republican puts it, "is simple—say 'peeled peaches' so the people will understand it, but the law won't."

In the campaign for this name which would express so much to consumers and so little to the federal department $100 was offered to the one who should suggest the best designation. The campaign brought in, it is estimated, over 70,000 suggestions. None, however, were quite satisfactory. It seems to be an exceedingly hard problem; some of the suggestions given below certainly did not come easy.

Nose-Kin, "Okay," Rid-O-Skin, Calipared, Sun-Nursed, Sunshined, Minuskin, Rid o' peel, Chemapeel, Sutzmi, Knoskin, Gotemskind, Knopeel, Knoskin, Ulelikem, Cant-Skin-Em, No-Fuz, Mechapeeled, Calibest, Peachmeat, Al-Skind, No-P-Lon, Gotemskind, Eureka, Red E Skind, Red E Peeled, Cno Skin, Peelt, Nugget, Minuskin, Peel-lac, Skin-lac, Skinshy, Lesaskin, Calacoskin, Lacopeel, Calacopeel, Calacskin, Caliskined, Gotemskind, Sanskin, Calicured, Nudo, Absen-peel, Ribanpeel, Fuzoff, Nofuz, Skynof, Shorn-O-Peel, Lac-O-Peel, Nudelyn, Calinuda, Knoskin, Scatskin, Nuway, Kno-skyn, Cote-off, Lesapeel, An-U-Skin, U-Peach, Betta, Utastnopl, Calipeel, Insideout, No-Needa-Skin, Kleen-Maid, Maid-Nude, Appeeled, Appeel, Skin-o-no, Mi-nuskin, Skinoff, Calipared, Nudried, Lack-Skin, Koatles, Knopele, Kotoph, Peel-o, Skinshed, Fuzz-no, Peacherino, Sunlov, Minopeel, Skindless, Skind, Capeco, Skin-solved, Flayed, Skinfree, Skinoff, Knupeel, Redipeeled, Skinoff, Hasnoskin, Hasnofuzz, Knopeel, Sanskin, Knoskin, Ridofuz, Delicia, Read-I-Tu-Eat, No-pel, Bare-O'Skin, Paregon, Ulika, Bareface, Sanspeel, Nopeel, Nofuz, In-d-Man, Pare-Me-Well, No-More-Fuz, Peelgon, Nupeel, Not-A-Fuza and Allgonskin.

What's the matter with Skin-nay?

Prepare your seed-bed properly. Keep the harrows going till it is in perfect condition. An extra stroke of the harrows may mean many bushels more per acre.

Adopt proper crop-rotation on your farm. Growing the same crop year by year on the same land must result in decreased yields and soil-impoverishment.

Roeding's Page on Trees

OLIVES

WHO would have believed twenty years ago that California would be supplying the European countries with the various fruits that she originally exported to the United States?

Today there is not a fruit grown in the great Mediterranean section in Europe, which is not being successfully produced and marketed in California. The success of the olive is a notable example.

Our Nurseries have been more closely associated with the growing of the olive than possibly any other concern in the State.

Twenty-five years ago we were growing over 30 varieties of olives At that time our attention was given to both the oil and the pickling varieties.

Now that it has been demonstrated that a good pickling olive makes an excellent grade of oil in nearly all cases, the elimination of so many varieties has been very pronounced. The demand has dwindled down to a few standard varieties which seemed to meet the exacting demands of firms engaged in the business commercially.

We have devoted our attention particularly to growing the best types of these recognized standards.

There are thousands of acres of fine land available for olive trees in California.

While olives can be grown on dry lands and the trees maintained by intense cultivation, it is not best to attempt to grow olives for pickling purposes except on land where irrigation can be practised.

VARIETIES TO PLANT

When planting an olive orchard, it is well to remember that the Manzanillo Olives are picked and in the vat before even commencing to pick the Mission Olives.

It is not wise to confine your planting to one variety of olives.

The Manzanillo is one of the standards for green and ripe pickles. It also produces oil of a very high grade. It is a very hardy, regular and prolific bearer.

Outside of the Sevillano or Queen Olives, which are so largely shipped as the green olive from Spain, the Manzanillo is the only variety exported from that country.

The Mission has always been a popular variety. The tree is a handsome upright grower; very fine for avenues; the fruit is medium to large; makes excellent pickles and a superior quality of oil.

A large grower and packer in California advises planting a portion of an orchard to Manzanillos and another portion to Mission Olives; by so doing the fruit will not all ripen at the same time, thus allowing the orchardist more time in which to harvest his crops.

Space on this page does not permit of us going into the subject as fully as we would like, but if any one interested in olive culture will write to us, we will be very glad to furnish additional information.

Orders for any considerable number of citrus trees received from all points in Southern California will be filled from our Nurseries at La Habra, Orange County, thus saving time and freight.

CITRUS TREES continue to be profitable. It was not so many years ago when it was generally believed that there was an overproduction, but improved marketing conditions have kept pace with the increasing production. Today there is a strong, growing demand for California Oranges, Lemons, Pomelos and Avocados. Any one who has suitable land, with water, need not hesitate a moment about planting citrus trees, for these trees, with proper care, will return a greater revenue per acre than most any other crop.

Oranges
Lemons
Grape Fruit
Avocados

WALNUTS AND PECANS should be extensively planted. They do well in many sections of California and return a good revenue to the orchardist. There are thousands of acres throughout the great valleys in our Coast counties which should be devoted to nut culture.

PERSIMMONS

We have called attention frequently to the desirability of planting Persimmons. The commercial importance of the Japanese Persimmon is well established. We have an excellent stock of the best known varieties of these trees.

Write today for our new illustrated 1917 price catalog, listing over 2000 varieties. When writing send us a list of your tree requirements and we will quote you prices.

All Kinds of Irrigation Appliances

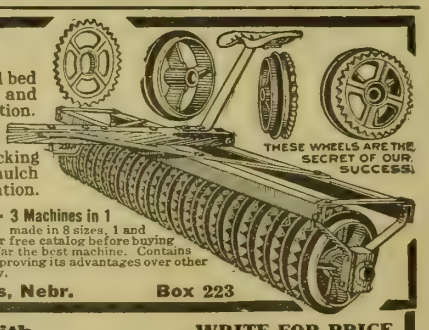
In these days of high prices and shortage of all manufacturing materials, it gives us pleasure to announce that we have a full supply of Irrigation Appliances on hand at convenient distributing points all over the Pacific States, and are prepared to make prompt deliveries throughout the season.

We are the pioneers in this business, and the largest manufacturers of Irrigation Appliances in the world. Years of experience have taught us how to make the best possible goods at a fair price.

Write today for booklet on "Irrigation"—or for any specific information you may require.

KELLAR-THOMASON COMPANY
"Originators of the Valve System of Irrigating"
1226 East 28th Street Los Angeles, Cal.

WHEAT, ALFALFA
and other grains yield more where a perfect seed bed is prepared. The **Western** pulverizes, packs and mulches—makes a perfect seed bed at one operation. Saves seed, time and horse power. Is especially adapted for breaking crust on winter wheat or other grain or in orchards after irrigation or packing rains. It forms the hardest crust into a granular mulch without hurting the grain, and prevents evaporation.



Western Pulverizer, Packer and Mulcher 3 Machines in 1 made in 8 sizes, 1 and 3 sections, prices $20 and up. We want every farmer to have our free catalog before buying a roller or packer. It proves we can save you money and have far the best machine. Contains full description, price direct to you, letters from many farmers proving its advantages over other makes, and much other valuable information. Send for it today.

Questions and Answers

ANSWERS BY EDITOR AND STAFF

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Roup

One of our hens choked to death and we found her windpipe completely closed with a cheesy, spongy, yellow substance. Several have had the same thing come in the eye, and one in the corner of her month. We treated with iodine and olive oil, which soon cured the trouble. The hens have a good appetite, droppings are natural and seldom do they quit laying. What is the cause and what can we do to prevent it? It is not contagious as we have 300 in flock and but six so far have had it. We noticed the first case after a liberal use of air slaked lime about the houses and yards.—Subscriber, Corona.

The symptoms are those of roup, but the fact that only six out of 300 birds are affected seems to indicate that the trouble is individual rather than sanitary. Sometimes in a cold season like the present certain birds which have for some reason or other a predisposition to colds will be affected while the rest of the flock is apparently immune. You will try of course to find anything which may be at fault in the sanitation of your houses, such as lack of sunshine or ventilation, cracks or knotholes which let in a draft on the head of the nearest birds. You will also visit them at night to see whether they are spread out over the roosts or crowded together in a corner, and you will, without fail, isolate every bird that shows similar symptoms. With these precautions the approach of warmer weather and your successful treatment of the disease when it does appear, I don't think you need fear an epidemic. It is just possible that the lime, while it could not produce roup, has made the throats and eyes of the birds more sensitive than they should be. The use of lime is not generally recommended because it is apt to be injurious when used liberally.—J. A. K.

Yard Room For Hens

How many square feet of yard room is necessary to handle 50 laying hens if they are kept in this enclosure all the time?—Subscriber.

The amount of yard room given to hens is largely a matter of individual taste and available land. Some very successful poultry men advocate the no-yard plan, maintaining that hens lay better when they are kept in roomy, well-ventilated houses without any yard at all. Some others keep their hens mainly in the houses but give them small yards in which to take the air. Others give small houses and as much yard as is convenient. I recently saw 600 hens kept in a space not more than 75x200 feet and 200 on a single 50-foot lot. I should not like myself to give 50 hens less than the amount of room contained in a yard 30x50, which is 1500 square feet or 30 square feet per hen, but most commercial poultrymen give considerably less. There is this to be considered however, that where 1000 hens are kept in a yard 200x80, as is the case with one poultryman I know, each hen can run over the whole 16,000 square feet, so, though she has actually but 16 feet she can call her own she has really more room for exercise than the hen in the 30x50 enclosure. The best plan, where hens are to be kept yarded is to have two yards and plant them in alternation to grain and other greens.—J. A. K.

Rennet

Will you please give directions for preparing rennet from freshly killed calves. The commercial rennet reads "With white wine 15 per cent alcohol." What is white wine?—Subscriber, Santa Barbara.
